MINING AND SCIENTIFIC PRESS

Whole No. 2189.—VOLUME LXXXV.
Number 1.

SAN FRANCISCO, CAL., SATURDAY, JULY 5, 1892.

THREE DOLLARS PER ANNUM.
Single Copies, Ten Cents.

The Gold Mountain, Cal., Mine.

The Gold Mountain mine is situated in the Holcolm Valley district, San Bernardino mountains, San Bernardino county, Cal. It is reached by a stage journey of 40 miles from Victor, Cal. This mine was formerly owned by Lucky Baldwin, who operated a 40-stamp mill on it for a number of years. The mine was a losing proposition, owing to the low grade of the ore and lack of proper management. The mill burned down and the mine was sold to Capt. De Lamar, who erected a new 40-stamp mill and put Mr. Spargo in charge of the property, who has succeeded in placing it upon a paying basis.

The vein is a huge dike of quartz and quartzite, 60 feet wide, and can be traced for miles through the country. The ore averages from \$3 to \$6 per ton and is all free milling. All values down to 25 cents per ton are recovered by the plates and blanket sluices. The mine as operated is practically an immense quarry. Mr. Spargo has driven a series of tunnels under the vein at a depth of 100 feet from the surface. These connect with the open cuts by means of winzes. This enables the cars to be loaded through the chutes, without shoveling, and it is mined and delivered at the mill at a cost of about 40 cents per ton.

The company contemplate shortly erecting an 80-stamp mill below the present one.

Vagaries of Ore Bodies.

Some prospectors make the mistake of not confining themselves to their prospects. It is the prospect that makes the mine, and it should be followed until it has been proven beyond a peradventure that it is something more than a blowout or a body of local extent. Many prospectors find an outcrop of ore on the side or apex of a hill, scrape around it for a few feet, then go down the hill and begin an expensive tunnel; or they will discover the outcrop of what they assume to be a horizontal ore body, and, going back on the hill, will begin a shaft. They expect to catch the ore at so many feet, but they assume too much. It is not often that they prove absolutely correct.

If the ore is not continuous it almost invariably inclines one way or the other, and it proves more disastrous to attempt to catch it by interception than it would to follow it. If it is intended to catch it with a tunnel it is almost certain that a longer tunnel will be necessary than has been reckoned upon.

Gold Mountain Mine, San Bernardino Co., Cal., Showing Open Cut.

While the ore may appear at the surface as a vertical, radical changes may occur within a few feet or yards of the top, and it may dip off and become a flat shoot, or, if of local origin, pinch out altogether.

And the same with the outcrops of what go in and develop into verticals. By following them the miner is taking advantage of this, and he is likely to gain not a little information concerning the characteristics of the vein that may prove valuable in working, if it proves worth working.

In the folding of the earth's crust by which mountains and foothills were formed the fissures were opened that make veins, and from every main lode or mother vein laterals extend as the branches of a tree from the trunk. These laterals are smaller, do not extend so deep, frequently pinch out, sometimes do not bottom for 100 feet, always extend out either side of the main lode, with both walls alike, and can rarely be traced any distance. Whenever a vein extends in the same course 3000 to 5000 feet, and that course is the trend of the district, it should persist

in values to great depth or to primitive rocks where, of course, all mining ceases. It is not necessary that a vein shall be on a contact to be valuable, but as the ground parts easier in a contact than elsewhere, here the larger fissures have occurred and the greater values have been found to a greater depth. Intrusions have occurred in some veins and scattered the ore. This has been caused by a reopening of the fissure after the formation of the ore and an inflow of some of the lavas, most generally andesite, but these intrusions seldom extend to any great depth and the ore is found below in place and between the regular walls.

EXPERIMENTS on steam pipe condensation by putting results together and taking the average show that when the number of square feet of pipe surface exposed to still air is multiplied by the difference in temperature between the air to be heated and the steam inside of the pipe, and the product divided by the number of pounds of water obtained per hour by condensation, the quotient is practically 420, so that a rule for determining the amount of condensation in pipes, based on these results, is as follows: Multiply the number of square feet of pipe surface by the difference in temperature between the air in the room and the steam in the pipe. Divide the product by 420 and the quotient will be the pounds of steam condensed into water per hour. With 300 square feet of pipe, carrying ninety pounds pressure, in air at 50° F., the temperature of steam at ninety pounds is 331°, making the difference 331—50=281. Then $300 \times 281 \div 420 = 200$ pounds of water per hour. This rule is based on favorable conditions, which means that the air was nearly still. When the air is in motion the condensation will take place faster.

ADVANCE in steam boiler practice permits specifications to include, in addition to the usual tensile and hydrostatic tests, the following trial conditions: Evaporation 11.5 pounds, where 10.5 pounds is usually specified. Priming, foaming or lifting to be impossible, and moisture in steam not to exceed 1% under any conditions. To stand forcing to 50% above rating to date of acceptance, without leaks, or above 10% loss in economy; quick changes between no load and full load, or sudden drops in pressure from any cause; in no case the circulation to be reversed, the tubes overheated, or the water lifted. Ground hand hole joints to be made tight without bolts. Internal cleaning to be accomplished without shutting down, or the use of mechanical cleaners.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Gold Mountain Mine, San Bernardino Co., Cal., Showing Open Cut; View of Mill, Gold Mountain Mine, San Bernardino Co., Cal. 1. Diagram Showing Increase of Rainfall With Rise in Elevation Over the Sierras in Central California, 6. Mining and Metallurgical Patents, 10.

EDITORIAL.—The Gold Mountain, Cal. Mine; Vagaries of Ore Bodies; Formation of Mountains and Foothills; Experiments on Steam Pipe Condensation; Advance in Steam Boiler Practice, 1. Admitting Arizona to Statehood; "Mining" Advertisements in Eastern Dailies; Editorial Commendations; Expert Evidence; New Survey Rates, 2.

MINING SUMMARY.—11-12-13-14-15.

LATEST MARKET REPORTS.—16.

MISCELLANEOUS.—Concentrates, 3. Assaying Copper Ores and Products; Nevada's Surface Mineral Wealth, 4. Made Ground; Liability of Mine Employer; Science Not Essential to the Prospector; A New Explosive, 5. Relation of Rainfall to Runoff in California; Mexican Mining Notes, 6. Production of Copper; Liquid Fuel—Boiler Firing With Oil; Copper Converters, 7. To Dissolve the Smelter Trust; Hoisting Works for Deep Mines; Knowledge Needed in Mill Work; Chlorine and Gold, 8. California Mining Industry; He Had Not Resigned; American Copper Mine, 9. Mining and Metallurgical Patents; Deep Borings in the United States, 10. Personal; Commercial Paragraphs; New Patents; Notices of Recent Patents; Recently Declared Mining Dividends; Trade Treatises; Books Received, 16.

THERE is no good business reason for delay in admitting Arizona to statehood, but there are several business reasons why that rich Territory ought to be a State. It isn't a question of "justice," or politics, or sentiment, but a business proposition. The country is really dependent on the West for the hulkion that is the blood of business. Anything that aids in developing the country's highest and best paying industry is good business to do. A State is always better fixed for mining than a Territory. Arizona is a rich mining region, and thus business, national policy and general progress dictate advance. Statehood for Arizona is in direct line with such advance.

SOME of the "mining" advertisements in Eastern dailies are so ridiculous as to make one wonder if there be people silly enough to believe them. Yet the thousands of dollars so spent manifestly yield big returns from the credulous victims. These advertisements of hogus mining properties never appear in any place where any one is likely to have any knowledge of the facts. They are not intended for home consumption, but are published in the large Eastern cities. Their circulars are sent by the thousand to rural residents in prosperous localities. Iowa has given up several hundred thousand dollars to such sharks. Illinois and Indiana are also good fishing grounds. An amusing part of the business is big advertisements of mine swindles in New York and Boston weekly "mining" journals, while alongside appear denunciations of other similar schemes, in hopes, perhaps, of compelling them to pay tribute to the editorial prostitutes.

FROM Arizona and Montana come commendations of editorial utterances herein, which is usual and is appreciated, but noticed here because of the suggestion that such utterances be repeated, the importance of the subject discussed deserving reiteration, and, indeed, requiring repeated notice, that the matter be brought to the renewed attention of mining men everywhere. While agreeing with our correspondents in the belief that that subject does deserve continued editorial reference, yet, in this as in other equally important matters, it is manifestly impossible to give it more than passing attention. So many things press on for deserved notice that they can (any one of them) only get brief hearing. There are several subjects that deserve constant discussion, but in such a journal as this, continued harping on one string, or even several strings, would argue a poverty of resources and would inevitably elicit a suggestion from several thousand busy men that something new were more desirable. This indicates sufficient answer to the suggestion, which, in the main, is a good one.

Expert Evidence.

When two mining companies go to law, the experts retained by each side to give testimony form a prominent and important part in the case. Theoretically, the expert is honest and competent. Sometimes he is both; occasionally he is honest without being competent; it is within the limits of possibility that there may be times when he is neither. The best expert is entirely honest and thoroughly competent. As to his value—an expert is a witness. When cases can be carried on in court without witnesses, then mining suits, involving mining rights, can exist without experts. Of course, if there were not two views by different lawyers and two views by different experts on a given subject, there would be no litigation—there could be none. It is the function of the court to determine which of these two opinions is more nearly reasonable, which is right, as the court sees it. The decision lies with him, not with the experts, nor the attorneys. The first court may be wrong, but the case can go to the appellate court and two appellate courts may see it differently.

What the duties of an expert are is of itself a debatable question. It may be considered that an expert, honest and competent, will sift the facts, bring his knowledge to bear on the point at issue, present those facts as he sees them to the best advantage for his client and tell the truth—not the whole truth, but what he says is to be the truth. Two men can honestly have different views on the same subject, and can, with equal honesty and knowledge of the facts, draw diametrically opposite conclusions. It is then for the judge to decide. If he knows all about that maze of modern mystery called "mining law," it is well for all hands; if he is not fully posted as to that particular case, it would be well all round that the court be permitted to have its own expert as a technical adviser. The opinion of such an adviser upon claims, infringements, damages, etc., would be of manifest value. When experts are put on the stand by the parties to the suit, the judge is sometimes justified in regarding their testimony merely as arguments under oath, where prepossession or bias or undue zeal often generates erroneous conclusions. Indeed, much of the expert testimony which judges are called upon to read is largely disregarded. The most conscientious experts can, as lawyers generally do, convince themselves by their own arguments of the correctness of their position. And if anyone keeps on thinking and saying anything long enough he will get to believing it himself after awhile. The conclusions of an expert selected by the court, or concurrently by the parties, for his qualifications in the particular case, would command genuine confidence, would largely control the decision of doubtful questions, and would relieve the court of great responsibility. Such an innovation would also be economical, and tend to a quicker conduct of mining litigation.

Throughout, this is putting the expert on a very high plane, but he ought to be on a high plane. Ordinarily the public deride expert testimony. This is because of the popular misunderstanding of facts, due to a hazy notion that an expert is a good deal like a lawyer, and if the facts don't fit the desired verdict, why so much the worse for the facts. An expert should be on as high a plane as the court itself, only that the expert does not decide the case. Of course, right here the reader may say: "If the court had its own expert, as you suggest, it would place so much reliance upon the conclusions of its expert that the judgment ordered would in many cases be that of the expert and not of the court." True, and in that case it might be a just judgment and in entire accordance with the law and the facts, but the suggested contingency need not arise to any greater degree than it would in the present procedure, where the court in its decision is likely to give greater weight of credence to one expert than to the other. Any expert worthy of the name, on either side or any side, will, so to speak, take the law into his hands. He can't help it. He knows; he is better acquainted with the facts than the others, and oftentimes better posted on the law in the case. He is not exactly "the whole thing," but he is the highest part of it.

This paper thinks that in mining cases involving the need of expert testimony it were well for the

court to have its own technical adviser, call him "expert" or anything else. This need not debar the litigants from having their own experts, too, for the court might not always select one as competent to take up the technical and scientific features of the case as other available persons known to the lawyers of the litigants, and thus an injustice be done, although, undoubtedly, the expert adviser of the court would always be competent to review the testimony of the experts for the litigants. Such suggested employment of a court adviser would tend to shorten the time consumed in taking testimony, and help to lessen expenses. It would result that testimony by experts for litigants (knowing that an expert appointed by the court was to review their testimony), would be shorter, sharper and more direct, and, possibly, even the lawyers might then trim the case down in view of that very fact, and not lumber the record with matter "irrelevant, incompetent and immaterial."

It would also weed out the shifty, crafty, unreliable "expert," and inure to the benefit of the really reliable expert and all concerned in having justice done and having the right prevail.

It might be added that in whatever way an expert might be employed by the court, as is here suggested, it would not be possible for him to thoroughly understand the case, unless he had views of other experts on the subject. An expert usually does not, in one sense, make the case, but he stirs up the case, so that one is able to get at the truth, and the stirring up of the case is best done by having two competent men discuss the matter on opposite sides.

As to the common spectacle of two experts on different sides testifying different ways as to the same set of facts, it by no means follows that either one is insincere or dishonest. Two honest experts may in a mining case testify honestly directly opposite to each other. The reason is this: In every case the opinion of an expert is based upon his understanding of the facts. Now two persons having opposite characters of mind may form two different views, and honestly, too. It is the duty of the court in that case to determine which particular expert view is the proper one. And in such case an expert for the court would be a valuable adjunct.

Judges are usually chosen for their probity and for their legal qualifications, not for their scientific attainments.

It is not uncommon to have the courts and the public attack or criticise experts, and sometimes with reason. The remedy does not lie in an attack upon the judges or a sneer at the public, nor in a defense of the defects in the present procedure, but in an effort to reform and improve the system and the sometime conduct of the experts themselves.

New Survey Rates.

There is a notable change in the federal charges for mineral surveys. In accordance with paragraph 3, General Land Office circular of the United States mining laws, approved June 24, 1899, relating to the expense of office work connected with the survey of mineral claims, which authorizes the Surveyor-General in each district to require a deposit for platting and other office work for mineral surveys, the General Land Office has directed that on and after July 1, 1902, the estimated cost of platting and other office work in connection with the surveying of mineral claims will be computed as follows:

For lode claim.....	\$30
For placer claim.....	35
For millsite.....	30
For millsite, included in one survey with a lode claim.....	20
For each lode claim within and included in the survey of a placer claim.....	20
For several lode locations included in one survey, the first location named.....	30
All other locations included, each.....	25
For several placer locations included in one survey, the first location named.....	35
All other locations included, each.....	30
For affidavit of \$500 expenditure of improvements, after approval of survey.....	5
Should an amended order issue, an additional deposit will be required.	

Any traveling agent claiming to represent this paper is an impostor unless he can produce properly signed credentials and possesses a book of receipts numbered in triplicate.

Concentrates.

COPPER tubing one inch inside diameter, of standard thickness, will stand a heat of 700° F.

ONE HUNDRED cubic feet of water per hour is a miner's inch in Colorado; $1\frac{1}{2}$ cubic feet per minute is a miner's inch in California.

THERE is a difference in "barrels" as applied to oil measurement. A barrel of crude petroleum is 42 gallons—5.6146 cubic feet; a barrel of refined petroleum 50 gallons—6.684 cubic feet.

CRIPPLE CREEK, Colo., has been yielding net profits from the start, and in eleven years the gold mines there have earned public dividends and undivided profits to the amount of \$31,000,000.

AMMONIA SULPHATE OF COPPER is made by adding ammonia hydrate to a solution of sulphate of copper in water, till the precipitate which is formed at first is dissolved. A clear blue liquid results.

THE dip of a ledge can be followed from a mining claim into land covered by an agricultural patent, but the dip of a ledge can not be followed from land covered by an agricultural patent into a mining claim.

MAGNALIUM is an alloy of aluminum and magnesium, used in the construction of mine-surveying instruments. The alloy gives as good results as brass and weighs but one-third as much, size for size.

THE cost of handling ore by aerial wire rope lines, like all other things in mining work, depends entirely upon local conditions. Under favorable circumstances the cost would be estimated at 5 cents per ton mile.

THE power of any explosive can be figured from its formula. Find the number of volumes of gas which can be produced by the combustion of the substance. This at 15 pounds per volume will give the pressure.

COMPRESSED AIR can be used directly for ventilation, refrigeration, drying, or operation of elevators. It is not a rival of electricity, but has its field as one of the great motive powers, the same as the steam or gas engine.

SMALL "model" stamp mills can be made to give results that cannot be duplicated on a commercial scale. A mining school should have a standard equipment of mining appliances to afford instruction of any tangible value.

A "CARLOAD OF ORE" is an indefinite quantity. On a broad gauge road it is usually about sixteen tons; on a narrow gauge from eight to twelve tons. Much depends on the condition of the roadbed, the car itself, and how it is loaded.

MERE supposition or imagining is not enough to require a mining ditch owner to flume because of possible resultant damage to adjacent mining property. But he must guard against such damage, and is responsible for any loss occasioned thereby.

IF a volume of air at sixty pounds pressure, equivalent to 18,000 cubic feet per hour at atmospheric pressure, be passed through 1000 feet of pipes, the loss of pressure of air for $2\frac{1}{2}$ -inch, 3-inch and $3\frac{1}{2}$ -inch pipes would be 5 $\frac{1}{2}$ pounds, 2 pounds and $1\frac{1}{2}$ pounds, respectively.

THE "talc" of the mineralogist is a different thing from the "talc" so-called by some miners. Real talc is a little like mica and is semi-translucent. It is a silicate of magnesia. What is ordinarily called "talc" is a silicate of alumina, a clayey mineral much like kaolin.

THE sulphobalides of lead are readily prepared by dissolving lead sulphide in the balogen acid and diluting this solution with water. The chlor and bromsulphide separate immediately as red precipitates. An excess of water converts this precipitate into black lead sulphide.

LAKE SUPERIOR figures that copper ore yielding 1% will pay costs. One and one-half per cent ore will pay a profit. The most economical metallurgical and mining processes are in operation in the Lake region, though but little ahead of some Montana and Arizona copper properties.

WHERE peroxide of hydrogen, as an antidote for internal cyanide poisoning, is not immediately obtainable, two drops of ammonia on a lump of sugar and eaten immediately forms a fair antidote. In cases of external cyanide poisoning a warm bath containing bicarbonate of soda and common salt will allay the eruption.

THE California State Mining Bureau has \$57,000 public money for its biennial expenses. Of that sum \$10,000 goes for printing, \$29,000 for field work—outside investigation and reports—and the remainder for rent, salaries, supplies and general expenses. It is and always has been faithfully and economically administered and is of great public benefit.

AS to recording notice of location of mining claims in California it is not deemed sufficient by the Surveyor-General, when application for patent is made, that copies of location notices certified to by the district recorder be supplied. It has been held that these notices "must" be recorded with the county recorder and certified copies thereof be furnished by the county recorder.

THE statement that "when the water is evaporated into steam it leaves all of the impurities behind it," is not always true, for some of the impurities and solid matter will pass out in and with the steam. Cases may be cited where the safety valve of boilers being continually leaky, when examined, a thin coat of white scale

was found on both valve and seat, caused by using soda ash as a boiler compound.

THE lifting power of any gas is the difference between the weight of the gas and the weight of the same volume of air. One cubic foot air at normal pressure weighs 1.29 ounce avoirdupois; one cubic foot pure hydrogen under the same conditions weighs 0.089 ounce avoirdupois. The difference is 1.2 ounce, which is the weight that one cubic foot of hydrogen will balance in the air. It will lift any weight less than that.

TO UNITE ordinary cast iron is not an easy task, but it may be done, if one has luck, by boring a dozen holes in the parts to be united, then secure well and place about the break an abundance of filings of good pig iron, some wrought iron filings and also some of steel. Lute with fine clay and place in fire (before luting use any good flux, borax, etc.); heat until the filings melt and fill all the cavities. Let remain in the fire until fire goes out and the metal is cold; then remove and clean up.

IN applying the straight-line formula to composite columns made up of several sticks bolted together at intervals, give to each stick its proportionate share of the total load to be carried over that member, and then assume that it stands alone and unsupported. This is the only safe rule. Even though they are firmly bolted with packing blocks or washers notched into the sides, these grow loose in time, and do not resist initial lateral bending. They should never be assumed to act as one solid stick.

THE cost of a 100-ton cyanide plant in the Black Hills, S. D., would be from \$25,000 to \$30,000. To run it per day of twenty-four hours would average for labor, per day: Two engineers at \$3.50 each; two firemen at \$3 each; two crusher men at \$3 each; two men on rolls at \$3.50 each; two solution men at \$3 each; four pulp men at \$3 each; one chemist at \$5; one assayer at \$3.50; one helper at \$2.50; total, \$55. Cost per ton for treating would be: Labor, 55 cents; cyanide, 30 cents; coal, 30 cents; zinc, 10 cents; repairs, 10 cents; incidentals, 10 cents; total, \$1.45.

A COMPOUND ENGINE is one having two or more cylinders, usually two, however, a high pressure cylinder and a low pressure cylinder, the latter being the larger. The steam from the boiler enters the high pressure cylinder and after performing a certain amount of work it is exhausted into an intermediate vessel or cylinder called a receiver, whence it is admitted into the low pressure cylinder; after performing a certain amount of work in this cylinder it is allowed to escape into the condenser, in a compound condensing engine, and into the atmosphere in a non-condensing engine.

IT is held by some millmen that the crushing in a stamp mill is mainly the result of the reaction from the die after the stamp has fallen, citing the fact that if a stamp is allowed to fall upon a single chunk of ore resting upon the die the upper portion of the lump will be found merely fractured, while a good deal of that part of the chunk next to the die will have been reduced to powder. The logical conclusion of this is that the crushed material should be got out of the mortar as soon as possible. It is thought that with free milling ore 60% of the gold should be caught in the mortar.

ONE way to tell the weight of ore in a mine "in sight" is to exactly measure an excavation from whence a known weight of ore has been removed. Determining the weight of ore in place is a work requiring extreme care: 13 cubic feet to the ton applies only to solid quartz rock. In the case of oxidized ores it may require from 15 to even 18 cubic feet to the ton, while in lead, zinc and other base metal mines it may require less than 13 cubic feet to the ton. As a general rule, it may be stated that the cubic contents of an ore body in feet, if divided by 11 if sulphides and by 15 if oxidized, will give the tonnage, approximately.

IN the same gulch or river channels the smaller pieces of water-worn gold are purer than the larger ones. The exterior layer of water-worn nuggets is finer than the interior. Native gold always contains silver. On an average about one-tenth of a gold nugget is silver, which is more easily corroded than gold and readily attacked by sulphuretted hydrogen, common salt and other ingredients of surface waters. Such substances act upon the silver close to the surface of a nugget and dissolve it away, or convert it into the compounds which wear away as the nugget is rolled forward beneath the heavy gravels at the bottom of a stream.

ABSOLUTELY PURE SILVER is produced in the United States Mint by electrolysis of fine silver, using an electrolyte of silver nitrate with 1% free nitric acid. From the bar of silver 0.999 electrolytic action throws the silver down in the form of crystals, which are washed. In melting these crystals the flux used is three parts fused borax and one part pure niter. The bar's second melting is made without a flux to remove the oxygen introduced by the niter of the flux. When the silver is thus melted it is stirred with a piece of dry wood as long as the action due to the presence of oxygen continues, then poured into a chalk-lined mold, the bar cleaned with a brush and dilute sulphuric acid, and after being rolled out is ready for use.

THE Rankin leaching process of copper extraction is operated by R. A. Rankin at Tartana Hill, Queensland, Australia. The process is simple. The ground ore is placed in a vat with a dilute solution of sulphuric acid, and agitated for an hour, in which time all the copper contained in the ore is dissolved out and converted into a

solution of sulphate of copper by the acid liquor. The contents of the vat are then run into a settling vat, where the slime sinks to the bottom, leaving the clear sulphate of copper solution to be drawn off into precipitating vats. Water is added to the slimes, and after these have settled again the liquor is drawn off in its turn into the vats, the removal of all the sulphate solution being thus secured, deposition of the copper is obtained by placing zinc or iron in the vats. This throws down the pure metallic copper—in the former case in very thin leaves, and in the case of the iron as a fine powder. The precipitate is washed off the iron by hosing with water. The ore used in the experiments was graded up to 15%, the analytical test giving 27.42% of carbonate of copper or 14.13% of copper (metal).

THE capacity of any pump cylinder per minute is equal to its area multiplied by the length of the stroke of the piston or plunger and by the number of strokes per minute. The area of a 4-inch cylinder is $4 \times 4 \times .7854 = 12.56$ square inches; this multiplied by the length of the stroke gives 75.36 cubic inches, as the volume of water discharged for one stroke. The discharge for 120 strokes would be $75.36 \times 120 = 8643.2$ cubic inches = 37.4 gallons per minute. A pump will not discharge that much water, owing to the friction of the water in the pipes and to slippage, which amounts to an average of 25%; 75% of 37.4 gallons is 28 gallons. By the term slippage is meant the difference between the theoretical quantity of water discharged per stroke, per minute or per hour as the case may be, and the quantity actually discharged by a pump in which the pistons and valves are water tight. If the quantity obtained by calculation is 100 gallons per minute, and the pump actually discharged 85 gallons per minute the slippage is said to be 15%. The loss by slippage does not include the loss by leakage. The former refers to the difference between the calculated and actual discharge at the pump when the latter is in good working order, that is, when the piston or plunger and the valves do not leak.

THE weights of electric locomotives vary from 4000 to 30,000 or even 40,000 pounds. A 12,000-pound machine would have about the following proportions: draw-bar pull on the level, 1500 pounds; speed, 6 to 10 miles per hour; two 20 H. P. motors; a minimum gauge of from 27 to 30 inches; minimum width over all, 48 to 50 inches; minimum height of from 36 to 40 inches; length, excluding bumpers, from 9 to 12 feet; wheel base, from 40 to 55 inches; diameter of wheels from 28 to 30 inches. A 24,000-pound locomotive would have a draw-bar pull of 4500 pounds; 6 to 10 miles speed; two motors of 50 H. P. each; gauge of from 35 to 40 inches; outside width of from 58 to 65 inches; height of from 38 to 45 inches; total length of from 11 to 12 feet; wheel base length, from 40 to 56 inches; and diameter of wheel from 28 to 30 inches. The minimum weight of rails that can be used satisfactorily varies from eight pounds per yard for a two-ton locomotive to forty pounds for the heaviest. Mines using from 12,000 to 16,000-pound machines should, under ordinary conditions, use about a 30-pound rail. Where exceptionally heavy service is encountered the adoption of sixty-pound rails is meeting with favor. The draw-bar pulls are given for running on the level. On an up grade the pull will be reduced on account of the locomotive having to pull up its own weight. The element of the force of gravity tending to pull the car down hill, and which therefore must be overcome, is approximately one hundredth of the total weight for each per cent grade. This would be equivalent to a draw-bar pull of twenty pounds per ton. In the case of the 12,000-pound locomotive given above the draw-bar pull on a 5% grade would thus be reduced from 1500 to 900 pounds.

OCCASIONALLY comes the question: "What is your authority for the statement you make in the 'Concentrate' wherein you state, etc.?" The MINING AND SCIENTIFIC PRESS is pretty good authority itself, and what it asserts is usually authoritative. This is not said in an arrogant way, but with becoming humility, duly mindful of all it implies! The word "authority" is vague. Generally, it means a statement or decision coming from some source of recognized ability, knowledge and final jurisdiction. Sometimes it is an opinion; sometimes an interpretation; sometimes a decision; sometimes a succinct statement of a patent fact. To quote "authority" for a statement herein does not always add to the value of the matter, and often it would merely invite contradiction. Take, for instance, the question of water rights in California, or tunnel sites in Colorado, or location law in Arizona: No matter how wild or incorrect a statement may be made anywhere on those subjects, some decision of some court of competent jurisdiction could be cited as "authority" thereon. Even the Supreme Court of the United States—the biggest tribunal on earth and the best "authority"—sometimes reverses itself. It does not follow that there is no established "authority," but it does follow that in matters of opinion there can not be a continued holding to the same view. Even facts themselves change, and so does "authority" thereon. When a statement of fact is made herein in answer to one of the numberless questions answered on this page, it is the fact as at present existing; if it be on a matter of opinion, a decision of a court, or established belief, the statement is made in consonance, so far as possible, with existing facts, these facts being procurable from the most recent developments, and that constitutes "authority." Of course, "infallibility" is quite a different thing, that being an attribute not vouchsafed even to Divinity itself, for we are assured in Holy Writ that the Lord made mistakes and was sorry for them.

Made Ground.

Written for the MINING AND SCIENTIFIC PRESS, by C. H. FITCH.

In my native city in the East, when its population was no more than a twentieth of the present population and some of it was more hog than city, there was a place to which boys could go, and by jumping make the ground shake over a considerable area. This ground is now solid and built over with substantial buildings, having no piling under them, but made in the usual way, with a foot of masonry deep enough to make cellar storage space and get below what is called the frost line.

This change did not come about in my time. It was told me by old men how as boys they used to go to a certain place and make the ground rock. This was in New England, the land of steady habits, where "trembores" and quakings of earth are practically unknown. There were no expensive works of reclamation. Sewerage systems had something to do with it, draining the neighboring land, although made without any idea of solidifying the shaking tract. Another factor in the change was the thickening of what might be called the surface skin by dumping and filling of debris.

In other words, the ground was made solid by a thicker cover less permeable to water, and the water was drained from under that cover. But I do not attribute much effect to the artificial effort of drainage. I consider that the covering did more than the sewerage to make the land hard. Water near the surface, or near enough to it to prevent the formation of a dry and solid shell of considerable thickness must usually be replenished through the surface. At great depths the hydrostatic head may be sufficient to cause a fluid pressure alike in all directions, but near the surface gravitation continually draws away the water. If we roof over a large area, deprived of water the ground under it becomes dry and hard. If we put the roof on the ground so that the surface waters run off instead of penetrating, the ground is solidified.

I have not seen this simple idea of drainage by covering advanced in any technical treatment of this subject.

The next age will not be the age of iron or steel so much as the age of cement. The manufacture of cement and cement-making of materials has advanced enormously of late, and is destined to have a far greater advance. It is an instrumentality in human hands by which man can cope successfully with one of the greatest natural powers of depletion and deterioration—water. It affords a plating which will not rust, which will hold, guide and restrain water where it is of damage to us as in roads, mine shafts and ways and the courses of shifting rivers, such as the Yellow river of China to the restraint of which John Barrett recently invites the attention of American engineers as a problem worthy of their steel.

The point I make and wish to emphasize again and again in the treatment of many such problems is that the practical and available remedy is a skin remedy, impermeability, surfacing and not essentially great depth or bulk of works. This idea is the ruling one for making ground what we require it to be in distributing and bearing weight or lateral pressure, in resisting flow and fluid saturation and in guiding and restraining water courses. In mining works underground these allusions to surface might not seem to apply. They do, however, apply. We can build at enormous expense an enormous honeycomb of timber sets, and this is sure to crush and become racked out of true in time. The only alternative is a system of protected ways and breaking down, sorting and filling with waste in series. In some cases a protecting shield might be used. The substitution of cement lining circular shafts in place of timbering square or rectangular shafts will come in due time. There are a good many places where arched cement work can be used to a limited extent, even if incomplete, as in passing a quicksand or turning the direction of an underground watercourse.

In the construction of the Wachusett dam, a great structure with 2000 feet base in cross section, trenches of 60 feet depth were dug, and from the bottom of these sheet piling was driven to a further depth of 67 feet, trenches being filled with cement. The depth of bedrock was 285 feet. It will thus be seen that the engineers, contrary to scripture, were building not only their house, but a huge dam 65 feet in height upon the sand, and every step was carefully considered, over a thousand borings being made, and the flow of water through the strata of sand being tested and found practically nil.

I never heard of mining operations being facilitated by the interception of flow through a previous stratum of ground to save pumping and dewatering, and make the mining ground more easy to work in the block irrigated by this stratum. It might be done, however, as a watershed, that would be effective over a limited area.

In the "Black Belt," south of Selma, Alabama, the roads get almost impassable in the wet season. I have been told of a case in which a yoke of oxen got mired and was left to perish like those prehistoric animals whose remains indicate that they were mired

in bogs before the dawn of human history. In the dry season these same roads are hard and smooth as a floor. To make a road for such a country that would be good in the wet season I would not attempt any depth of foundation, but simply provide a surface impervious to water and of the greatest practicable breadth. Any opportunities for draining off excess of water might be availed of, but in the absence of possible drainage, a road impervious at the surface and protected by side trenches providing for thin walls of cement would be like an inverted cup which could not be water-filled from below, hence would remain dry and hard. Under cement walks laid in my neighborhood which is a wet region, not much above the level of Lake Michigan, I find that the ground is dry to some depth. Water cannot flow up under such surfaces without displacement, and the movement is very slow. At depths under some pressure, where water is drained out the voids close and capacity for holding water is also reduced.

A neighbor who had a fine oak tree put a beautiful 6-foot cement walk around it at a cost of 16 cents a square foot. He might have girdled it cheaper, as next season the tree, like the old mistress in the plantation song, "died all over." ("When she lived, she lived in clover; when she died, she died all over.") Abundant rains could not reach the roots of that oak parched under the roof provided for them.

Another surface consideration is frost. An excuse for giving a few feet depth and putting in a masonry plug to abut against the soft ground is found in getting below frost line, as though there were a set frost level. Protection from frost, however, should take into account that it requires water, and usually movement of air, to make frost. I have measured a frost growth $2\frac{1}{2}$ inches high growing out of a clod (by condensation and cooling) like a stalagmite. A man had a windmill house, on the lower floor of which he stored potatoes. Frost never touched them. But he fitted up the floor above, and put a stove there, and the next winter everything below froze. The stove drew air from below, and this was replaced by cold outside air, and as far as this movement went there was a severe frost. A dry impervious covering is very effective in resisting frost.

I think, in the articles of which this is the third, that I have made out a good case for flat superficial blanket foundations. I was looking to-day at some foundations where I could see the work in progress far below me. There was a little pile-driving machine, and about two dozen piles for a soft spot, and some blocks of stone looking in distance about the size of pebbles, while the piles looked about the size of toothpicks. They stuck in these toothpicks, laid the pebbles upon them, and will build upon this foundation. This, mind you, is for a Chicago high building. Even where cement is used, as in the Marshall Field building, it is put down in a form like wooden piles. The wonder is that a flat distributing thickness of cement is not used instead of piles or piers of any kind. (Note article on Modern Building Foundations in MINING AND SCIENTIFIC PRESS, Sept. 21, 1901).

Liability of Mine Employer.

Concerning the editorial in last week's issue regarding injury to miners by accidents and the deplorable results therefrom, the following is given:

Two miners were employed at the bottom of a shaft. There was an elevator in the shaft, and when about to hasten they gave the signal to the engineer, who signified that he understood, by raising the bucket a few feet and then lowering it. Then they ignited the fuse and signaled the engineer to hoist, and were raised a short distance and then lowered, and the engineer shouted down the shaft that the compressed air by which the elevator was raised was cut off. One of the miners climbed up the elevator and escaped; the other could not do so and was killed by the explosion. The air was cut off by the foreman, who had full charge of the operation of the mine. There had been an iron chain ladder in the shaft, which was removed some weeks before the accident, to be replaced by a new chain ladder, which was on the ground and was to be placed in the shaft that day. It was held that where a corporation owning two mining plants has a general superintendent, with general oversight over both plants, and a foreman of each mine, who employed and discharged the men, and who directed and controlled the entire operation of his mine and of the various gangs of men there employed, such foreman is a vice-principal, for whose acts and negligence in the conduct of such mine the owner is responsible.—*Alaska United G. M. Co. vs. Muset* (114 Federal Reporter, 66), U. S. Circuit Court of Appeals, District of Alaska.

SCIENCE is not essential to the successful prospector, but he ought to be able to determine the nature of the more common ores in order to work intelligently. Those that should be studied to some degree are gold, silver, lead, iron and copper. Each of these when scratched with a knife or other instrument will expose a streak of bright metal, and to determine the character of the ore, if not the value, is of much importance to the prospector; however, many men, wholly uninformed, have met with suc-

cess. Geology is better learned in field work than from books, if the prospector is observing and analyzes the different rocks which he may discover. To do this a few chemicals or acids are needed, the use of which he may learn quickly. Every man knows granite from porphyry or lime from quartz. Feldspar is nearly like quartz, and may be determined from quartz by a smooth surface when taken from a vein. Talc is a soft slippery rock something like mica or packed clay. Calcite subjected to an acid test will dissolve or effervesce and is an element of lime. Dolomite, or carbonate of lime and magnesia, resembles calcite. It is a character of limestone. Gypsum is a sulphate of lime and is difficult to determine from its hardness. It may be scratched by the finger nail, and it will not scratch copper. Garnets are usually found near copper; they are of a reddish color and rather tend to be in cubes in the rock.

A New Explosive.

While attempting to find a flameless explosive F. L. M. Masury of New York discovered a compound which is receiving considerable present attention. In addition to being flameless, it is reported to possess other essential requirements for safety and efficiency. Some recent tests of this new high-power explosive compound were made by mining engineers on the grounds of the inventor at Sands Point, Long Island, N. Y., which, according to apparently authentic published reports, showed that this new substance is of economic value to miners. The extraordinary claim is made that while it possesses all the explosive powers of dynamite, it can be carried and thrown about like so much sand. The substance has been called "masurite," after its inventor, Mr. Masury. It is a light yellowish powder, granular, and somewhat resembling fine sand in appearance. Heat, cold or moisture are said to have no effect upon it, though continued contact with water tends to its deterioration. The heat of an ordinary flame will fuse it, but in melting it loses its explosive properties. By itself it will not burn, but slowly consumes when brought in contact with carbonaceous materials. It weighs about one-third less than equal bulk of dynamite and costs about the same as 40% dynamite. It is manufactured by the Masurite Explosive Co., 50 Broadway, New York City, represented on the Pacific coast by G. W. Myers, 417 Hayward Building, San Francisco, Cal.

In the tests referred to the following is furnished as a resume thereof:

In the concussion test the masurite was placed on an anvil and struck with a hand hammer and with a sledge without effect. An iron ram weighing sixty pounds was dropped 25 feet on a ten-ounce paper cartridge, filled with masurite, placed on an iron anvil. The blow compressed some of the powder into coherent cakes, but had no further effect. Twelve-pound tin cans filled with masurite were perforated with shots fired at close range from a 30-40 rifle, using both mushroom and steel-jacketed bullets, without effect on the explosive. The same result was obtained when burning brands of charcoal were placed in the powder and shots fired through the partly burning mass.

In heat, fire and electric spark test iron bars heated to redness were run through cartridges filled with masurite or used to stir the powder in a ten-pound can; portions of the powder fused and burned, the latter where in contact with the paper of the cartridge. Quantities of masurite were thrown upon a wood fire, also upon a charcoal forge fire blown vigorously. The substance was fused where the heat was sufficient, and burned where in contact with the coal. Smokeless powder and high-grade black powder were placed in intimate contact with portions of masurite and set off by a fuse. The masurite was not affected. A melting pot was filled with masurite, covered with an iron funnel; the pot then heated on a forge fire until the masurite melted and decomposed. The fumes passing off from the funnel could not be lighted, but extinguished the flame of a match. When masurite was rubbed between surfaces covered with sandpaper or emery, no effect was produced. Quantities of masurite were heaped upon an iron rasp connected with a 110-volt generator, and a wire connected to the other terminal was rubbed over the rasp. The electric sparks did not affect the powder. A copper wire was placed in a heap of masurite and a 110-volt current passed through; the wire was fused, but the powder was not affected.

In the detonation test a ten-ounce cartridge of masurite was fitted in the ordinary manner with a double strength electrical exploder, the exploder being placed in one end of the cartridge. The cartridge detonated violently. A similar cartridge was fitted with a similar exploder tied on the outside; the cartridge exploded as before. Half a cartridge of 40% dynamite was detonated at a distance of 12 inches from a cartridge of masurite without exploding the latter, but merely breaking the cartridge. A masurite cartridge when set off at a distance of 12 inches from a dynamite cartridge caused the latter to detonate. In this test the dynamite gave a bright burst of flame when exploding, in all the explosions of masurite no sign of flame appeared.

To show the effect of cold on the masurite a cartridge was placed for three hours in a can surrounded

by a freezing mixture. When the cartridge was taken out of the can a thermometer in the can showed a temperature of 6° F.; the cartridge was immediately fitted with a fuse and exploded, the same as the other cartridges which had been fired at normal temperature.

Relation of Rainfall to Runoff in California.*

A study of the available rainfall and runoff data for California watersheds has been undertaken and the accompanying diagrams and tables are here presented as the result of this work.

As the runoff diagram was to be used in estimating

Diagram Showing Increase of Rainfall With Rise in Elevation Over the Sierras in Central California.

the water supply available for various storage reservoirs for irrigation, it was thought best to represent the runoff in acre-feet per square mile. The majority of the discharge reports give the depth of runoff in inches. The accompanying table has been made for converting depth of runoff in inches to runoff in acre-feet per square mile, using the following formula: Depth of runoff in inches $\times (0.0833 \times 640) =$ runoff in acre-feet per square mile.

TABLE FOR CONVERTING DEPTH OF RUNOFF IN INCHES INTO ACRE-Feet PER SQUARE MILE.

Depth of runoff, Ins.	Acre-ft. per sq. mile.	Depth of runoff, Ins.	Acre-ft. per sq. mile.	Depth of runoff, Ins.	Acre-ft. per sq. mile.
.01	.533	.35	18.667	.69	36.800
.02	1.067	.36	19.200	.70	37.333

.26	13.867	.60	32.000	.94	50.133
.27	14.400	.61	32.533	.95	50.667
.28	14.933	.62	33.067	.96	51.200
.29	15.467	.63	33.600	.97	51.733
.30	16.000	.64	34.133	.98	52.267
.31	16.533	.65	34.667	.99	52.800
.32	17.067	.66	35.200	1.00	53.333
.33	17.600	.67	35.733		
.34	18.133	.68	36.267		

At the outset many difficulties began to present themselves. The most serious one was that of obtaining measurements of rainfall at the higher elevations. The streams most productive of runoff, and upon which discharge records had been kept, have their sources on the western slopes of the high Sierra Nevada mountains, where there are few or no inhabitants above 7000 feet, and consequently no observers of rainfall, but the valuable rainfall records of the Pacific Railway system along the line of railway from Sacramento to the summit of the Sierra Nevada at Railroad Pass offer a clue to solution of this difficulty. In the diagram the mean rainfall and the elevation of the station are plotted as ordinates and the distance inland of the station as abscissas.

The rate of increase of precipitation from Sacramento to Cisco, at the elevation of 6000 feet, the point of maximum rainfall, seems to be 0.6 inch per 100 feet of rise. The precipitation above the 6000-foot point decreases with the elevation approximately at the rate of 0.4 inch per 100 feet of rise.

*J. B. LIPPINCOTT and S. G. BENNETT in Engineering News.

Fortunately, in the Tuolumne river basin, about midway between the American and the Kings river basins, there is another series of rainfall stations, beginning with La Grange, elevation 293 feet above sea level; Sonora, elevation 1824 feet; Second Garrote, elevation 2900 feet, and Crockers, elevation 4453 feet. The mean rainfall of these stations plotted as in the above diagram indicates the rate of increase from La Grange to Crockers to be 0.84 inch per 100 feet of rise. This rate of increase has been taken to hold good up to an elevation of 6000 feet, and above this the rate of decrease of rise to be 0.4 inch per 100 feet to an elevation of 9000 feet. Probably the rate of increase and decrease would be more correctly represented by a curved line, but the data are not sufficient to warrant this.

Using these rates of increase and decrease, the mean precipitation for the years 1896-1899 at an elevation of 9000 feet in the Tuolumne river basin would be 49.8 inches; if snow converts into water at the ratio of 8 to 1, the snowfall would be 33.2 feet at this elevation.

It was found impossible to use the runoff data of the Kern river basin, though it is without doubt the most closely watched stream in the State, and the record is the oldest for any largest stream in the State, because of the exposure of the watershed and because of the scarcity of rainfall data. This watershed is bounded on the west for almost its entire length by a high mountain range. Concerning the precipitation on the east slope of this range there is little known beyond the fact that it is very much less than on the western slope.

In 1896 the total runoff from the Kings river basin of 1775 square miles was 1,871,005 acre-feet. For the same period the runoff from the Kern river basin was 619,630 acre-feet. The ratio of the area of the Kings river basin to the Kern is 1 to 1.32, the ratio of runoff 1 to 0.33, though the higher drainage areas of the streams are contiguous. It was also thought best not to use the runoff and rainfall data for Piru creek basin, furnished by the Antelope Valley Water Co., because the ratio of discharge in acre-feet per square mile was greater than any other record. There is little doubt about the accuracy of both the runoff and precipitation records, the explanation being that the rainfall observation stations were necessarily situated at so low an elevation that the record did not represent the mean rainfall for the higher portions of the basin.

SACRAMENTO RIVER BASIN.—The rainfall stations used in determining the mean annual precipitation for the Sacramento river basin were the following: Red Bluff, Rosewood, Redding, Delta, Dunsuir, Shasta, Sissons and Fort Bidwell.

There were absolutely no records for the great interior mountainous and lava country in Siskiyou, Modoc and Lassen counties, comprising more than 5334 square miles of the watershed.

Fort Bidwell is situated outside of the watershed, on the eastern slope of the mountains that form the boundary, and would probably have a less rainfall than Modoc county. The record was kept there for a period of 22 years, and the mean rainfall is 20.8 inches.

The average rainfall at Red Bluff for a period of 23 years, was 23.9 inches; at Rosewood, for a period of 6 years, 25.63; at Redding, for 24 years, 35.69. The precipitation of these three latter stations was taken to get the average for the Sacramento valley for the years 1896-1899, during which runoff measurements have been made at Jelly's Ferry. The mean rainfall of the Pitt river drainage area of 5334 square miles, which has an average elevation of 5000 feet, was taken to be the same as that of the Sacramento basin above Red Bluff.

The average rainfall at Delta for a period of 14 years was 62.39 inches; at Dunsuir, for 10 years, 57.16 inches; at Shasta, for 6 years, 53.26 inches; at Sissons, for 10 years, 32.75 inches. The rainfall at these four stations was taken to obtain the mean rainfall for the mountainous area of the watershed for the years 1896-1899.

Mexican Mining Notes.

[FROM A TRAVELING CORRESPONDENT.]

Sonora, District of Moctezuma: The Copper Queen M. Co. of Bisbee, Ariz., are going to erect at Douglas a 1000-ton smelter. Douglas is the terminus of the extension of the Arizona & Southeastern Railway which the Copper Queen people are building to their copper mines at Placeritas de Nacosari. Much of the copper treated by the new smelter will come from Sonora. Both the Cobre Grande in the Cananea and the Nacosari mines may rival the Copper Queen in the production of copper in a few years. The Guggenheims worked the old Nacosari mines for some time, but owing to not having the facilities for treating the ores at that time their results were not satisfactory. The Copper Queen Co. purchased the mines for \$250,000 and expended \$2,000,000 in development work and a new smelter. To-day the Nacosari mines lead in the production of copper in Sonora. With American capital, coupled with the same energetic development work which has been characteristic of the managements of the Nacosari and Cobre Grande properties, other Sonora copper mines can be made as productive.

The extensive copper belt of eastern Sonora runs the entire length of the State. In the northeastern section the belt lies in the porphyry next to the conglomerate which forms the country rock cut by the barrancas of the Rio Yaqui. In the Free Zona, about 30 miles southeast of Bisbee, are the Caballona and Kirk Bros.' copper mines. Farther south and east of Fronteras are a number of old copper workings. East of the Sierra Pinitos, on the southern border of the Free Zona, copper exists, together with rich gold and silver mines. East of the smelter at Placeritas de Nacosari are copper mines assaying high in gold and silver, such as the Monton de Cobre, Wene and San Francisco properties on the Arroyo del Los Alisos. The eastern slopes of the Haucal and Joriquita mountains also contain promising copper prospects. All of these claims lie adjacent to the railroad which the Copper Queen Co. are building to Placeritas de Nacosari.

In the Cerro Pinto country the copper exists in the granite, which formation runs east and west, and also forms the country rock of the mountains east of the Rio Yaqui and north of the Pueblos of Nacori and Bacadehuachi. East of the silver camps of Lampazos copper can be found outcropping between the lime and conglomerate. West of Sahuaripa the copper belt is cut by the Rio Yaqui, after which it runs through the Alamos district, where copper is found all along adjacent to the contact of the porphyry with the granite.

The gas engines with which Phelps, Dodge & Co. have been operating their smelter at Placeritas de Nacosari have proven such a success that they have contracted for 1400 H. P. to furnish power for their smelter at Morenci, Ariz., and Placeritas. The company manufacture their own gas, both from wood and coal.

Sinaloa, District of El Fuerte: A. E. Stilwell, the promoter of the Kansas City, Mexican & Orient Railway, says he has assurances from English capitalists that they will take all the necessary stock for building the road. No bonds have as yet been issued.

District of Sinaloa: The gold mining camp of San Jose de Gracia is on the Arroyo de San Jose, a tributary of the Rio Sinaloa. Some years ago San Jose was the leading gold producing camp in Sinaloa and one of the most lively in the Republic of Mexico. Its population was cosmopolitan. Europeans, Americans and Chinese worked the productive quartz and placer mines, while the Mayo and Tarahumari Indians performed the outside work and acted as arreadores with the large pack trains from Chihuahua and points on the Pacific coast. Cock-fighting and other games flourished, and gold dust acted as legal tender with the silver "dobes" of the realm. To-day San Jose has much the same appearance as a silver mining camp in Nevada. About ten months ago the big American company concluded cyaniding their mill tailings, and nothing has been done ever since. But while the plants of the big companies are lying idle the gambusinos and placer miners are bringing in some gold from the surrounding territory. During the dry months of the spring and early summer the Arroyo de San Jose is available for placering down to its confluence with the Rio Sinaloa. Aside from the temperature and the difference in the fauna incidental to the latitude San Jose reminds one of Ouray in Colorado. The formations have the same rich coloring, and the breccia is scattered profusely in the higher sections of country. Five miles northeast from San Jose is situated the mine and real of Rosario. This property is mined and owned by Mexican mining men. A 25-stamp mill is in operation crushing the ore. The company have finely constructed office and store buildings. A pipe line furnishes sufficient water for the real and the mill. The ore is rich, some pieces being covered with "chispas de oro," or nuggets of gold. Further east is the San Tomas mine, which is being worked with good results. A strike has lately been made about six miles from Rosario on the San Jose and Calahasios trail. It runs high in gold.

Chihuahua, District of Guadalupe: The Calahasios mine, lying east of San Jose toward Guadalupe

Calvo, has produced over \$2,000,000. The ore is a black-jack of lead, some of it carrying free gold.

District of Morelos: Messrs. Sheldon, Wood & Noble are operating the old Bellahuaque mine, which is situated 2 miles south of the old real of Los Tajos, near Morelos. This property consists of ten pertenencias of land and has values in gold, silver and lead. The owners have driven a tunnel to tap the antiguo workings at a depth of 300 feet. The tunnel has a depth of 150 feet, all in ore. Further south the same parties have denounced the Carmen, a gold proposition of five pertenencias of land. Five miles west of Los Tajos is situated the Rosario mine, which has produced half a million dollars in silver and lead. It consists of 10 pertenencias and is owned by Mexican mining men. Four hundred feet of tunnel work was recently performed to tap the old shaft workings. Negotiations are pending between the owners and Sheldon & Co. for the purchase of the property. The real of Los Tajos is one of the antiguo mining towns, and an immense quantity of lead and silver has been produced in its vicinity. Until the advent of Americans the mines were mostly lying idle, owing to the necessity for more modern methods of treating the ores and working the mines to a greater depth. The country around Los Tajos has been worked extensively by the gambusinos, or small chloriders, who extract the rich surface ores without the formality of denouncing or surveying according to law.

Production of Petroleum.

In his report on petroleum in "Mineral Resources of the United States, 1901," now in press, published by the United States Geological Survey, F. H. Oliphant notes that the production of crude petroleum was greater than that of any previous year; and that there was a very remarkable increase in the production in the States of Texas and California, a decrease in the production of the Appalachian or Eastern petroleum fields, and a slight gain in the output of the Lima-Indiana region. The total production of crude petroleum in the United States in 1901 was 69,389,194 barrels, being larger than that of any previous year. It was larger by 5,768,665 barrels, or 9%, than the production of the year 1900. The increase in the production of 1900 over 1899 was 6,291,854 barrels, or 11%, and the increase in 1899 over 1898 was 3%, or an average gain of 7.7% for the last three years. As compared with the value of the total production of 1900, 63,620,529 barrels, valued at \$75,989,313, the total production of 1901, 69,389,194 barrels, valued at \$66,417,335, shows a decline of \$9,571,987. In the order of production Ohio comes first, with over 21,000,000 barrels; West Virginia second, with over 14,000,000 barrels; Pennsylvania third, with over 12,000,000 barrels; California fourth, with over 8,000,000 barrels; Indiana fifth, with over 5,000,000 barrels; Texas sixth, with over 4,000,000 barrels, a loss in production, as compared with 1900, for Ohio, West Virginia and Pennsylvania, and a gain of nearly 4,500,000 barrels for California; of a little over 3,500,000 barrels for Texas, and of nearly 900,000 barrels for Indiana. This production for 1901, by fields, was in round numbers for the Appalachian field 33,600,000 barrels; the Lima-Indiana field 21,900,000 barrels; the southern California field 8,800,000 barrels, and for the Texas field 4,400,000 barrels.

The average price paid for all the petroleum marketed in the United States during 1901 was 95.7 cents per barrel, as compared with \$1.194 in 1900, showing a decrease of 23.7 cents per barrel or 20%, the lowest price since 1898. The gross decrease in value for 1901, as compared with 1900, was nearly 13%, notwithstanding that the quantity increased for the same period a little over 9%. The average price paid for Pennsylvania petroleum, which represents 48.5% of the total production, was \$1.21 per barrel in 1901, as compared with 57% produced in 1900 and marketed at an average price of \$1.356 per barrel, a decline of 14.6 cents per barrel, or 12%. There was a decline of 37.7 cents per barrel in the average price paid for California petroleum, and a decline of 76 cents per barrel for the Texas product in 1901, as compared with 1900—a decline accounted for by the increased production of the new fields developed in both these States. The total number of wells completed in 1901 in the United States in the search for petroleum approximates 14,250, of which 3,220 are estimated to be dry. The cost of these 14,250 wells is estimated at \$21,375,000, approximately one-third of the receipts for the entire crude product. The average price received for all the various grades of petroleum exported from the United States in 1901 was 6.73 cents per gallon, as compared with 7.52 cents per gallon received in 1900 and with 6.83 cents per gallon in 1899. The developments of the oil pools at and near Beaumont, Texas, and in the section surrounding Bakersfield, California, and the developments at Boulder, Colorado, have been the chief causes of the organization of some 1,578 oil stock companies with a capitalization, acknowledged and estimated, of \$669,083,000 in 1901.

The American Smelting & Refining Co. is now shipping 500,000 ounces of silver weekly to Mexico to be coined. It has contracted to ship 5,000,000 ounces and expects to ship 10,000,000 more.

Liquid Fuel--Boiler Firing With Oil.*

By JAMES W. WARREN.

The chemical composition of liquid fuel and its calorific value as compared with that of solid fuels have been so ably presented in various papers that it is hard to find an opening to introduce new matter on this very important subject.

The State of California, while prolific in natural resources for the support and comfort of mankind, is a little shy on coal; but, though lacking the solid carbon, we are blessed with an increasing volume of hydrocarbon, and the daily uncovering of new oil-producing fields in southern California assures the steam user of an abundant supply of liquid fuel. Not alone on terra firma is the rhythmic hump of the oil well drill heard, but on the bosom of the Pacific the drill goes down into the bed of the old ocean, and, tapping the oil strata, we draw from under the mighty deep millions of gallons of liquid fuel.

The discovery of liquid fuel in such large quantities in southern California has made its use general for all manufacturing purposes, also for the burning of brick, oiling roads to subdue the dust, for smudge fires to temper Jack Frost, for malt houses, for all steam railroads in southern California, and for crematories.

The petroleum oils of southern California are of an asphaltum base and carry with them about 30% of asphalt. There being little paraffin and a comparatively small amount of illuminating oil in their composition, distillation is not as general as with Eastern petroleum. The greater amount of distillation of the local petroleum is for the large quantities of asphalt it carries, this asphaltum finding a ready market here and in the Eastern States.

The liquid fuel from our local oil fields is pumped from wells within the city limits. These wells average 1000 feet in depth. The oil carries in suspension considerable sand and water, for the removal of which storage and heating are required. This oil is delivered to consumers in tank wagons of about twenty-barrel capacity. When the oil is delivered to the consumer a sample is taken from the wagon and tested for temperature, gravity and percentage of water. The average temperature is 70° F., the average gravity 15° B., and the average percentage of water about 6% of the load in the wagon. The method of determining the amount of water in the oil is by the gal-o-line test. This test is made with a test tube holding 100 cubic centimeters and graduated in one-hundredths. The tube is filled with 50 cubic centimeters of the oil test and 50 cubic centimeters of gasoline. By agitating the mixture thoroughly the gasoline cuts the envelope of oil that surrounds the globules of water in the oil, allowing the water to precipitate itself to the bottom of the tube. The percentage of water that gathers in the bottom of the tube determines the percentage of water in the load, and deductions are made accordingly.

The low gravity and high flash test of the local oil make it perfectly safe for use under boilers and in storage. Loss by evaporation, due to exposure to the heat of the sun, is comparatively small.

The method of bandling the liquid fuel at the generating station of the Los Angeles Electric Co. is as follows: The fuel is pumped from the main storage tank to the main furnace supply tank of 100 barrel capacity. In this tank the oil is heated to 80° F. It then passes to a pair of small duplex steam pumps, which give it twenty pounds gauge pressure. The oil then traverses pipes within the breeching of the boilers, which heat it to 190° F., then on to the burners. The burner is of the spray type, using steam as the medium of spraying the oil. These burners consist of two circular discs, 1½ inch in diameter, slotted and arranged in such manner that the oil, fed by separate pipe to the lip of the upper disc, meets the steam at its orifice just under this lip. This steam forms a fantail spray which breaks up the oil into particles sufficiently small to ignite immediately by the heat of the brick lining of the furnace and the layers of bricks upon the grate bars. Each one of these burners has an evaporation efficiency of 3000 barrels of water per hour from and at 190° F. The sound of combustion produced by these burners is comparatively soft. The flame fills the furnace box, covering the entire furnace box sheets of the boiler. This gives active beat action to all of the evaporative service of the fire sheets without unduly heating any one particular portion, and, at the same time, perfect combustion is taking place, as denoted by the absence of any colored gases leaving the stack.

If economy in the use of liquid fuel is to be considered, a high temperature thermometer in the smoke stack is as necessary as a water gauge glass on a boiler, for by the thermometer only can the fireman graduate the amount of air necessary for perfect combustion. As a test of this, our fireman can raise the temperature of the gases in the stack from 450° to 600° F. by closing the asphalt doors 1 inch. By the use of the thermometer the fireman can so regulate the burners under each boiler that it will do its proportionate amount of work. This is very essential in plants working many boilers set in batteries. It is

* Read before the National Electric Light Association at its twenty-fifth convention held at Cincinnati, O., May 20, 21, 22, 1902.

an important point that the evaporative efficiency of the burners should be kept as high as possible; that is, the burner that consumes 5% of the steam which it evaporates should not be allowed to consume 20%, which it might do if not judiciously controlled.

In summing up the advantages of liquid fuel over solid fuel for steam generating plants, we obtain the following:

- Concentrated form.
- Economy of handling.
- Increased evaporative efficiency.
- Cleanliness.
- Abatement of smoke nuisance.
- Reduction in depreciation account.
- Reduction in repair account.
- Reduction in sundries account.
- Efficiency in emergency.

In considering the comparative storage area required for coal and for the equivalent amount of oil, taking yard storage as a basis, 40% less area is required where oil is used. In the floor area of the fire room 50% less area in front of the boilers is required when oil is used as fuel. In economy of handling, the complement of boiler room help is reduced fully 50% and the transportation of ashes is entirely eliminated.

The evaporative efficiency of oil as compared with the same weight of our average good steam coal is 28% bigger than that of the coal.

In making a comparison of the cleanliness in the use of oil as against coal, and the saving gained, the advantages are so far-reaching in the minor items that only a few of the larger savings will be touched upon. There is a saving of 75% in the cost of paint, waste, brooms, tube cleaners, etc., required in the everlasting removal of coal dust, dust from ashes, soot, etc.

The use of liquid fuel solves the smoke problem, as smoke issuing from a stack where oil is used for fuel is an evidence of improper combustion, and can be avoided.

The use of liquid fuel reduces the deterioration of steam generating apparatus 25%. This is effected by the even fire of fuel oil, there being no undue strains on the fire sheets, caused by the frequent opening and closing of fire doors, as in the use of coal. The absence of large amounts of sulphur in oil prevents those chemical combinations which so rapidly corrode the tube ends. Ashes, lodging in obscure places and inaccessible corners of the boilers, absorb moisture and form a strong chemical affinity for the parts of sheets with which they come in contact, causing rapid corrosion.

As to the reduction in repair account, the cost of renewing the lining of furnaces, renewing grate bars, bridge walls, back arches, etc., is reduced 80% by the use of liquid fuel.

In the reduction of the sundries account the items of coal scoops, slice bars, hoes, firing irons, tube scrapers, wheelbarrows, water hose, steel brooms, wood for starting fires, etc., are entirely wiped out when liquid fuel is used.

In the use of liquid fuel the engineer has an able assistant to help him out in case of an emergency call upon his boilers. If required to raise steam rapidly he can do so without endangering the burning out of his boilers as greatly as when coal is used. On the other hand, if for any reason it is necessary to shut the fires off immediately it can be done without the annoyance and danger of pulling out a heavy fire from the furnace.

In conclusion, the record of results obtained from the use of liquid fuel in southern California stands out so prominently in liquid fuel that many of the larger steam generating plants in the northern part of this State have abandoned the use of coal in favor of liquid fuel. Its simplicity in operation and control and the low cost of installation make it a desirable factor in the economies of a steam plant.

Copper Converters.

A converter plant, as generally known in this west half of America, is for the purpose of converting copper matte, which usually carries about 50% of copper, into pig copper that is within 2% or 3% of being chemically pure. Some plants go a step further by reducing a portion of the copper to a still higher grade, in the form of anode plates for the refinery.

The converter is a large movable iron vessel not unlike a huge jug open at the top. This is lined with a thick coating of well ground silica, which consists mainly of oxygen. Into this converter is poured the molten matte, which is from 50% to 54% copper, perhaps 25% or 30% sulphur, the remainder consisting of iron and other impurities.

Into this molten mass a current of air is turned, the oxygen of which, uniting with the sulphur, keeps up and intensifies the combustion, the oxygen of the air being reinforced from the silica lining. When the charge has reached a certain stage indicated by the color of the fumes and setting metal, the converter is tilted over by machinery and the iron and other impure matter floating upon the surface are run off into pots, and, cooling, form slag. When this is substantially all removed a forced draught of compressed air is turned on, and the sulphur itself is blown away in the form of vapor or fumes. The copper remaining is then drawn off into molds, and constitutes

what is commercially known as pig or blister copper.

The slag referred to contains a small percentage of copper, and in order to save this it is remelted in the blast furnace and goes again into the form of matte, when the converting process is repeated.

Some works turn out 250 tons of copper each twenty-four hours. Of this, about one-half is sent East in the form of pigs for refining, the other half remelted in the tilting furnaces and then cast into anode plates for refining locally. In the tilting furnaces the copper undergoes further chemical changes, getting rid of small quantities of foreign matter and being put into better shape for refining.

At a plant of any note there are from five to fifteen converter stands and from two to four tilting or refining furnaces. There are also four to six blast furnaces, each of 200 tons a day capacity. The blast furnaces take the better class of ores, melt them, run off much of the impure matter and form matte, which is then treated in the converters, the slag referred to being melted in the blast furnaces along with the ore.

To Dissolve the Smelter Trust.

Proceedings on behalf of the State of Colorado to dissolve the smelter trust were started in the Supreme Court at Denver July 1. Colorado complaint, filed by the attorney general, sets forth that the American Smelting and Refining Co. and several other smelter concerns are in a combine to restrict competition in the smelting business; that the results of the monopoly are injurious to the industries of the State; that it is violating the laws, and that it is paying unreasonable dividends upon excessive and fictitious capitalization.

The complaint concludes with a demand that the defendants be adjudged to have forfeited their rights to do business in Colorado, and that they be ousted and forever excluded from doing business in the State, and that a receiver be appointed to take charge of their property.

The court stated that in fairness to the defendants they should receive notification of the suit, and therefore the filing of the proceedings was withheld until they can be informed of the contents of the attorney general's complaint.

The hearing of the State's right to proceed with the suit will probably be set for to-day.

The defendants in the case are: The American Smelting & Refining Co., the Omaha & Grant Smelting Co., the Pueblo Smelting & Refining Co., the Bi-Metallic Smelting Co., the Colorado Smelting Co., and the Philadelphia Smelting & Refining Co.

The complaint recites the facts of the formation of the trust in New Jersey with a capital stock of \$65,000,000, and adds:

That said American Smelting & Refining Co. was organized by the aforesaid defendants for the specific and deliberate purpose of creating a monopoly of the business of smelting and refining gold and silver and other valuable ores and metals, as aforesaid, and to substantially egress the same, contrary to the public policy and the laws of the State of Colorado.

Subsequent to the incorporation of the American Smelting & Refining Co., it is alleged, this company unlawfully conspired with and induced the other defendants to transfer to it all the plants in the State for a consideration of \$65,000,000, each concern to receive its pro rata share. The Philadelphia smelter at Pueblo, it is said, was conveyed to the trust for \$35,000,000 in stock of the American Co.

Then follows an arraignment of the company's methods, particularly excessive charges "for the smelting and reduction of the gold and silver ores which are shipped to it by the people of said State," conniving with railroads to destroy competition, and "wrongfully keeping back for its own uses the difference between the published freight rates and the said secret rates wrongfully secured by said American Smelting & Refining Co. as aforesaid."

The trust now refuses to receive for smelting all of the gold and silver ores offered to it by the citizens of Colorado, it is stated. It is further stated:

That said American Smelting & Refining Co., in order to further carry out its said conspiracy and unlawful monopoly, and in disregard of its public duties and obligations, has shut down and dismantled divers of its smelting and refining plants, to the great injury of the public said American Smelting & Refining Co. was supposed to serve. That said plants were prosperous-going concerns prior to their conveyance to said American Smelting & Refining Co., as aforesaid, and would, but for said conduct of said American Smelting & Refining Co., be prosperous and go on concerns to this day.

Further on in the complaint it is alleged:

By reason of the awe which said American Smelting & Refining Co. has inspired in the hearts of the railway managers of the State of Colorado, thereby securing secret and more favorable freight rates than are enjoyed by the general public of the State, as aforesaid, and by reason of the extortionate and unreasonable charges demanded and received from the people for the smelting and reduction of their ores as aforesaid, the said American Smelting & Refining Co. has been enabled to pay, and does now pay, excessive and unreasonable dividends upon an enormously excessive and fictitious capitalization of \$100,000,000.

Hoisting Works for Deep Mines.

NUMBER II.

H. G. Graves said it seemed to him that this problem of deep winding was simply one of speed. They had the stuff in the mine, and it had to be got out somehow; with that end in view it ought to be lifted straight away from the bottom to the top without any intermediate stops whatever. The whole problem was very much akin to that of rapid transit by electric or other railways where passengers wanted to get out of town to the suburbs and from the suburbs to the town by express trains. He thought, therefore, single lifts could only be taken into consideration. The strength of the wire rope did not affect the matter, as wire ropes could be built of any desired strength to carry any desired load. Practically at the present moment, with the improved manufacture of steel, he thought there would be no difficulty in getting what they wanted in the future. Accordingly, if they took speed as the sole object to be obtained in winding, they wanted to load at the bottom and to uncage or discharge at the top with the greatest possible rapidity, and that could only be obtained by self-loading and unloading skips or by uncaging apparatus. The speed during the wind must be as great as possible, or in other words, the acceleration must last the least possible time. The earliest point at which the greatest speed was to be obtained during the wind was not settled by any means; but by improving the guides, by using wire rope guides and by carefully arranging the slippers that slide on them, the speed might be increased beyond what it at present was. The only thing that remained was the acceleration. The speed had to be raised during the first five or six seconds of the wind up to its maximum, and for that purpose the weights to be moved must be balanced as far as possible. The energy imparted to the moving mass to bring it to its maximum speed was dependent upon the square of the velocity multiplied by the weight in motion and upon the unbalanced load multiplied by the height it was lifted. The total weight, and more especially the unbalanced load, must be reduced as far as possible in order to reduce the horse power. In one particular case, where 1200 tons were lifted 420 yards (that was quite a small lift, but it happened to be one in his mind), the difference in the horse power of the engine produced by putting on a tail rope was no less than 11%, 674 H. P. being required in one case and 749 H. P. in the other. The balancing was absolutely necessary, and the reduction of the weight was equally necessary. With an 18-foot drum, weighing twenty-five tons, for example, the mass that was to be put in motion was twice, or sometimes nearly three times, as much as the total weight of the rope, cages and the paving load lifted. To get that into motion absorbed a proportional amount of power. Of course, the energy was given up at the end of the wind during the retardation, but they could not afford the time to let the load come to rest of itself. They must put on the brakes so as to reduce the time, and they must have as light a weight as possible to start and stop. To reduce the weight they must have recourse to the lighter drums that were used in the Koepe or the Whiting systems.

R. James said that more than twenty years ago it was decided by old and experienced mining men who had been working the ore at the Comstock, that to have hoisting at a rapid rate, to have a single hoist was far superior to having a two-stage hoisting system. At that time there were shafts down to 3000 feet, and there was very little difficulty in constructing engines and manufacturing ropes to suit the purpose, and he might say that those engines were constructed for 2500 feet twenty-two years ago. Upon page 1 of Mr. Behr's paper he found that reference was made to the abandonment of two-stage hoisting on the Comstock—viz., vertical and incline (both being operated from the surface at the Savage mine)—on account of the expense. The mine referred to as working round taper ropes for the incline or second stage would be the Ophir mine on the north end of the lode. The Sutro tunnel, which tapped the Comstock lode at a depth of 1650 feet, did not reach the mines at that level until the bulk of the ore had been mined 100 feet below that point; after that sinking was resumed at most of the principal mines, and in the early eighties the actual depth attained at the Combination, a joint winding and pumping shaft, exceeded 3000 feet. No difficulty was experienced in winding rapidly (on his firm's direct lift). The method adopted was: Flat plaited, stout wire ropes, hemp hearts, 5 inches wide and, he thought, $\frac{3}{8}$ inch thick, winding on rules with long guide-arm attachments, three-decked cages and chairs at each station, so arranged as to hold the load while the operation of caging full and unloading returned empty wagons was taking place. The hoisting was most rapid, and when three landing platforms were constructed at the pit-head the winding, loading and unloading was as near automatic as possible. One, the largest winding engine at the Union shafts of the Bonanza mines, had a speed of 75 feet per revolution, and was capable of winding between 4000 and 5000 feet per minute. If he remembered correctly, this engine was built by the Risdon Iron Works of San Francisco, and reconstructed and erected under the supervision of the late W. H. Patton. The first upright drum indi-

cator, with spiral markers, was also attached to this hoisting plant, it being found more accurate and reliable than the old system (i. e., for dry mining). The rapidity acquired by the system of direct hoisting with the double rules and flat wire ropes, on the counter-balance system, was, at that period, proof sufficient, in the judgment of the most experienced engineers, to warrant the assertion that direct winding in actual practice proved to be far more economical than two-stage winding, and, moreover, could be safely accomplished from any depth, and with well-constructed shafts with sufficient compartment accommodation, backed up by compressed air ventilation, no difficulty need be apprehended—as the saying used to be—until the mile post was passed. The question of ropes seemed to him a most simple one; any one of our first-class manufacturers would be found quite capable of producing winding cables of any desired length and strength, the only precaution perhaps necessary would be for the larger companies to send a man who would eventually be required to keep the ropes in order at the mine to the rope factory, to see that the material contracted for was actually woven into the ropes. This was the plan of J. Mackay during the period of rapid hoisting from the deep levels of the Bonanza mines.

(TO BE CONTINUED.)

Knowledge Needed in Mill Work.

TO THE EDITOR:—Some mill men seem to be doing nothing to determine what, if any, changes are required. More of them are working by rule of thumb. Absolute scientific knowledge of what men are doing in milling is not so common as it ought to be. For instance, a man talks about slimes, and I ask, "What is your definition of slimes?" He answers, "Finely pulverized ore." They can give no other definition. The fact is, the question touches a fundamental principle in ore milling. It relates to the size of crushed ore that will pass through an 80 or 100-mesh sieve, or the material which does not settle in some stipulated time, when at rest, or it may be considered the difference between mill tailings and tonnage. One of the steps to be taken is to get an average of tailings, and, after sizing them, determine the values in each size. One test in this way is not conclusive; several tests should be made to determine the truth. These investigations should extend to the pulp when it goes upon the concentration tables used as well as when it leaves them. In this way the degree of fineness of crushing to be sought can be obtained. It is one of the first steps, or A, B, C movements in determining where the losses are, and how to reduce them, if possible. Upon it depends the height of discharge, height of drop, size of screen and weight of stamp required to give the best results. But this is only one of the many scientific—and scientific means common-sense accuracy—steps to be taken when one seeks improvement.

How many who run stamp mills never do any accurate sampling or assaying to actually determine what they are saving or losing? How many of these know the causes of loss? There are plenty of mill men who never disturb tappets, even when the shoes and dies are badly worn, and the drop increases, while, of course, the discharge becomes higher day by day. They never stop to think that, when the size which gives the best result is known, the object should be to get the ore through the screen as soon as it is reduced to that size, and to accomplish that the screen should be where it receives the greatest splash, or in case very fine material gives the best result, the screen should be where it receives, perhaps, the least splash. It is attention to these little things in nearly all occupations in this life which makes the difference between profit and loss. Because, a quarter of a century ago, some mill man stated that he had determined the best way to run a mill, is not a good reason for accepting his doctrine, any more than custom should cause a man to always follow the old foggy notions of his fathers. Wisdom was not born with, nor will it die with, the mill men of twenty-five years ago.

Pony, Montana, June 24.

Chlorine and Gold.

Written for the MINING AND SCIENTIFIC PRESS.

Nascent chlorine dissolves tin. This action is not confined to that metal. Gold and silver are no exceptions. Into a medium size evaporating dish pour 10 ounces of a 20% solution of chloride of sodium and heat to 160° F., adding 20 grains sodium nitrate. Place in the heated solution 2½ ounces sulphide gold ore powdered to 80 mesh. Slightly stir, so as to thoroughly mix; add one tablespoonful sulphur dichloride (S₂Cl₂). Sulphur dioxide, hydrochloric acid and chlorine gases will be evolved. Gently stir, and when quiescent (which will be in about ten minutes) add another like quantity of the reagent (S₂Cl₂). In fifteen minutes a small sample may be taken out and filtered for testing.

This will give a fair idea of what nascent chlorine can do, and the experiment can be tried on any sulphide ore if only finely pulverized.

After separating the metals from the salt solution it can be again used for dissolving, being still salt water and not sodic sulphate.

California Mining Industry.*

The present condition of the mining industry in California is satisfactory. At no time within the past thirty years has the aggregate annual production been so large. The output is showing a steady and marked increase in value. This is not to be attributed so much to the larger output of the older and well known mines, but rather to new enterprises brought to a productive stage.

The most notable feature in this connection is the attention being given to various mineral substances which, in the earlier days, were almost entirely neglected. For many years gold alone was sought for, and although other substances were known to exist, and found, yet little or nothing was done with them. Gold, quicksilver, silver and coal were mined to the exclusion of other substances which in these later years are worked to a profit, each adding its quota to the aggregate output.

The gold product of the State has for the past few years averaged about \$16,000,000. The State has had a succession of dry seasons, when there was considerably less water in the streams than usual, or this amount would have been larger. In a normal season, with the usual rainfall, the gold product should be about \$17,000,000 annually.

In silver the yearly yield is about \$1,500,000 in coin value of the metal. Few, if any, purely silver mines are being worked, most of it coming from operations in lead and copper ores, and some proportion being found with the gold in quartz mining work.

In the year 1900, the last of which we have complete statistics, of the sum of \$17,373,099 (total gold and silver), \$14,058,187 was from quartz mines, \$1,367,016 from hydraulic mines, \$1,018,246 from drift mines and \$930,250 from surface placer operations, including diggings worked by rocker, sluice, tom, river bed mines, dredgers, etc.

From copper mining operations, included in the totals of quartz, \$382,264 gold, and \$645,219 silver; and from lead ores \$67,660 gold and \$70,738 silver were obtained in 1900. For 1901 the amounts derived from copper ores were materially increased, especially in Shasta county, where there are now copper smelting plants.

There are five counties in the State which produce \$1,000,000 worth of gold and silver annually: Nevada, \$1,878,877; Calaveras, \$1,729,888; Tuolumne, \$1,659,250; Amador, \$1,388,703, and Shasta, \$1,369,107.

There are thirty-two counties in California producing gold, of which twenty-six yield some silver also.

There has been for the past eight years a regular increase each year of about \$2,000,000, and in the last year quoted even more. For 1901 it is expected that the official figures when completed will show some \$3,000,000 or \$4,000,000 increase over the previous years.

Within the past decade there has been a very marked change in the systems of quartz mining throughout this State. The speculative feature has been almost entirely eliminated and the work is conducted on a legitimate basis. None of the California gold mines are dealt in or quoted in the stock exchanges. They are mainly conducted as private enterprises, although the majority are owned and carried on by incorporated companies. Failures are much less frequent, and knowledge and experience have done much toward giving a reliability to quartz mining it did not possess in earlier years, when there was a general inexperience as to the characteristics of veins, and a lack of knowledge and economy in working the ores. It is possible now to work ores profitably which at twice the value twenty years ago were worthless. High priced or useless officials are no longer employed, and only skilled men engaged in the different departments. Railroads, better roads, cheaper supplies, improved means of transportation, better machinery at less cost, greatly improved reduction methods and appliances, water and electric power, oil fuel, canvas plants and cyanide process, and generally improved systems and appliances have all contributed to better the conditions and bring forth more profit.

As a proof that it is the new and changed conditions, rather than the mines themselves, which has made quartz mining so much better from a business point of view, may be cited the fact that so large a number of old abandoned mines have been rehabilitated and become producers within the past ten years or so. It used to be thought that a gold mine once found or purchased should not only pay practically for its own development, but for its own plant as well. In time, however, experience proved that the most successful properties were those which were properly opened with sufficient capital to develop and equip them. In large mines deep vertical three-compartment shafts have taken the place of inclines following the vein down, and ore is extracted through drifts running from shaft to vein. This is found to be the most economical and permanent method where the veins are of any size and the depth great. More-

over, in the case of the old abandoned mines, when reopened, the companies sink shafts 1200 or 1500 feet deep direct, without stopping to drift until the desired depth is obtained. This deep sinking involves large preliminary expenditure, so that only well-capitalized companies are able to undertake and continue the work.

Within the past ten years twenty-three of the once abandoned Mother Lode mines in El Dorado, Amador, Calaveras and Tuolumne counties have yielded since being reopened upwards of \$26,000,000; some of these referred to were worked for the full period named and others only three or four years.

The gold mines still yield the larger proportion of the total valuation of the mineral output each year. Out of a total of \$32,622,945 in 1900, the precious metals yielded \$17,373,699, or a little over one-half, and this notwithstanding the claim that copper and oil would each shortly put gold in the background. And while copper and oil are rapidly increasing in annual value, the gold output is also increasing, and it will be many years, if it ever happens, before gold will take a secondary place in the mineral industry of California.

Of this total of \$17,373,699, gold and silver (\$1,510,344 being silver), \$943,072 came from the counties of San Diego, River-side, San Bernardino, Los Angeles, Ventura, Santa Barbara, San Luis Obispo and Orange, the balance coming from northern California mines. Kern county, being the dividing line between the two geographical (and not political) sections, produced \$959,988 in 1900, most of it coming from the mines at Randsburg and Johannesburg.

The order of rank of the mineral substances produced in this State according to annual value is: First, gold (\$15,863,355); second, copper (\$4,748,242); third, petroleum (\$4,152,928); fourth, silver (\$1,510,344); fifth, quicksilver (\$1,182,786); sixth, borax (\$1,013,251). These are all that yield over \$1,000,000 annually.

As showing the growth of copper mining in California, it may be stated that the metal was produced in four counties in 1899, in eight counties in 1900, and in eighteen counties in 1901, as follows: Alpine, Alameda, Amador, Calaveras, Fresno, Inyo, Kern, Mariposa, Madera, Merced, Mono, Nevada, Placer, San Bernardino, Sacramento, Shasta, Stanislaus and Trinity.

Mines are also being developed in other counties. Smelting works are in operation in Shasta, San Bernardino and Contra Costa counties, the latter treating ores from Fresno county. Ore is also treated by the custom smelter near Port Costa. By far the largest production of copper is in Shasta, that county having in 1900 yielded 25,736,473 pounds, out of a total for the entire State of about 29,515,512 pounds. For 1901 Shasta produced about 30,990,781 pounds out of a total of 34,931,985 pounds. This value, with that of gold and silver, brings Shasta county several million dollars ahead of every other county in total valuation of mineral output. In May last another large smelter was started at the DeLamar mines. This product, added to the larger yield of the Mountain Copper Co.'s smelters at Keswick—the largest on this coast—adds very materially to the yield of Shasta county, and still other smelters are shortly to be built.

It is to be noted that the presence of these larger copper smelters has an important bearing on gold and silver mining. Quartz is needed for flux, and thousands of tons of ores are purchased for this purpose. Therefore, miners find a ready market for their ores, and hundreds of quartz mines, formerly idle, are now being worked. Ores of so low a grade that they would not pay to mill alone can thus be utilized. The miners can work these claims and be at no expense for reduction works, selling their ores at a price based on the gold and silver contents by assay.

He Had Not Resigned.

The Cornish Telegraph of recent date tells the following story: A correspondent of ours in the United States sends the following story, which he says is told by the miners at one of the Portage Lake mines, illustrating the frankness, honesty and force of character of one of the Cornish mining captains: A new superintendent having been appointed to a mine whose lease of life was considered nearly run out, in order to curtail expenses or make room for a man he had in view later on, went to one of the mine captains while he was at work underground, and quietly told him that his resignation would be accepted, or, in other words, the company intended to dispense with his services. "You can say," said the superintendent, "that you have resigned." "All right, cap'n," was the reply. When the shift was ended the discharged captain went straight to the changing house, which was filled with miners. He addressed them as follows: "Ere, boys, when you read that morning paper you'll read as 'ow I resigned my position, 'aving in view a job with more honor and higher salary. That there story'll be a lie, for boys, I'm sacked. I did not want to leave. I was satisfied to stay with you, for I was putting in all my brains for this 'ere company, and not spending my time looking for a better job. The long and short of it, boys, his, I'm fired. I guess there may be room for me somewhere. No 'ard feeling, boys."

American Copper Mine.

Written for the MINING AND SCIENTIFIC PRESS.

The table herewith will show the expense of opening a small shaft in the Middle States, which may prove interesting as a matter of comparison with expenses in other districts. This table covers 540 shifts, ending December 31, 1901. We did not run a night crew all the time and shut down for all legal holidays, with the usual result.

		Per Ft., Shaft.	Per Ft., Drift.
1—Management.....	\$ 1,800.00	\$ 1.481	\$ 0.938
2—Drilling and blasting.....	2,865.47	2.36	1.49
3—Mucking.....	3,152.01	2.594	1.641
4—Other mine labor.....	3,886.18	3.198	2.024
5—Hoisting.....	1,120.70	.922	.583
6—Compressed air.....	4,216.90	3.47	2.20
7—Explosives, etc.....	1,475.00	1.20	.80
8—Mine lighting.....	265.48	.218	.14
9—Mine supplies.....	416.51	.342	.217
10—Repairs.....	304.90	.25	.16
11—Pumps and fittings.....	175.80	.217
12—Shaft fittings.....	540.53	.667
13—Oils.....	81.22	.067	.042
14—Lumber.....	203.16	.25
15—New equipment.....	130.00	.16
16—Surveying.....	115.00	.08	.08
17—Assaying.....	300.00	.247	.156
Totals.....	\$21,048.86	\$17.723	\$10.391

Ore consists of native copper inclusions in a hard metamorphic rock lying as a contact sheet, with trap hanging wall and hard sandstone foot wall. Under the sandstone lies hard shale. Dip of the formation averages 11°. The ore bed is 2 feet in thickness, and as copper runs up into the trap about 8 inches of the latter is also broken. To make headroom, the sandstone and shales are taken to 3 feet thickness or more, as the layers thicken, so that the shaft averages about 6 feet in height and something more than 10 feet in width. Our practice has been to shoot out the sandstone and shale beneath the ore, with cut as usual. As this takes only 3 to 3½ feet, it diminishes the effectiveness of the powder, but the practice was generally followed to secure separation of the ore from the waste. As the work is being done for development, and to ascertain the exact value of the bed, it was thought wise to incur this extra expense, as well as some further expense on the dump in piling the ore for special mill runs. The result was satisfactory, as we succeeded in getting exact values for all the ground penetrated.

The work done during the year was as follows:

	Feet.
Reiff or main shaft.....	655
Spencer shaft.....	165
Drifting at Reiff shaft.....	640

Maximum depth of shaft, 1110 feet m dlp. Total drift work at Reiff shaft amounts to 1800 feet. No work of importance other than repair work was done on any of the other shafts during the year.

In the table Nos. 1 and 17 include only amounts apportioned to the mine, the cost being divided proportionally between the mine and mill. No. 4 includes the expense of preparing runs for the mill and some small labor items, which by rights should be charged to the mill, but owing to the difficulty of determining this with exactness it has been allowed to stand charged to mine expense. No. 6 includes coal, engineers, firemen and necessary oils, etc., for the air plant. Pumping was done by air. About 8,000,000 gallons of water was handled from the shafts. This also includes the pumping of 15,000 gallons of water daily for use on mill tables. This water is pumped from two wells by air lift. A corresponding deduction should be made for this.

No. 8 includes, besides the regular lights, experiments on every known system of lighting except the electric light, and this amount does not include a few dollars spent at local tin shops for devices of one kind and another.

No. 10 I thought rather high, but included repairs made on a number of machines which had been carried along out of repair from previous years.

No. 11 includes a small beading pump every three months or so, and when everything worked rightly the men kept perfectly dry.

No. 12 includes main air pipe, discharge pipes for pumps, ties, 20-pound rails, signal wires, etc.

As will be noticed by No. 14, we are saved the great expense of timbering, all this lumber being used at the mouth of the new shaft or about the surface buildings. Below we use not a stick, and have openings 40 to 60 feet across. My idea has been to work out the ore and replace by waste made.

During the latter half of the year the work was done by contract with the men, the basis being the number of feet advanced in the shaft. I believe it was a saving to us and the men made more per day, but this is another story. Drillers' wages were \$2.50 and muckers made \$1.50. For unskilled labor we had to depend on Italian immigrants, but they are plentiful and willing.

This mine is 35 miles from New York City, 3 miles north of Somerville, N. J., in the Newark system, corresponding to part of Triassic time.

The drift work referred to in the table averaged 6 feet by 12 feet.

Somerville, N. J., June 24.

* Condensed from article by Chas. G. Yale, in annual edition Sacramento Bee, July 1.

Mining and Metallurgical Patents.

Patents Issued June 24, 1902.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

CONVEYOR.—No. 702,905; A. M. Acklin, Pittsburg, Pa., assignor to Heyl & Patterson.

In conveyors, combination with suitable receptacle, of track arranged parallel therewith, series of trucks on track, each comprising body portion having bearings at each end thereof and an axle journaled in bearings with wheels rigidly secured thereto, reciprocating bar secured to truck, and series of swinging flights carried by bar.

APPARATUS FOR THAWING FROZEN GROUND.—No. 702,924; G. R. Clarke, Dawson, Canada.

Apparatus for thawing frozen ground, comprising furnace, water compartment into which pass products of combustion from furnace, exhauster for water compartment, for removing products of combustion from water compartment after passage through water, means for drawing water from water compartment and discharging it upon frozen ground in drift, pipe leading from drift to furnace, for supplying latter with heated air, and means for supplying water compartment with water, point of supply of water to compartment and point of drawing off water from compartment being above connection between furnace and water compartment.

ORE SEPARATOR.—No. 702,990; F. C. O'Brien, Chicago, Ill.

In separator of class described, combination with ore-conduit, means for passing ore therethrough, of an amalgamating cylinder rotatably mounted in conduit provided with peripheral surface of copper, removable covering of copper wire gauze or netting contacting surface of cylinder, means for continuously supplying a coating of mercury to cylinder.

ART OF TREATING ORES CONTAINING SILICA OR SILICATES.—No. 702,943; G. Guiraud, Cripple Creek, Colo.

Roasting, with free access of air and agitation,

charge containing ore, silicon in oxygen combination, and haloid salt of alkaline earth metal, quantities being substantially those quantitatively requisite to form stable silicate of the alkaline or alkaline earth metal, and haloid of precious metal, continuing heating ore until haloid of metal to be recovered is volatilized, carrying off, collecting separate from fumes of combustion, precious metal values as haloids or oxyhaloids.

ELECTRIC METER.—No. 703,051; T. A. Edison, Llewellyn Park, N. J.

In an electric meter, combination with overbalanced beam, a core connected to one end of beam, stationary coil surrounding core and traversed by current to be measured, register connected to and movable with beam, and friction wheel movable with beam connected register, cam with which friction wheel periodically co-operates, electric motor connected across line for rotating cam at constant speed, an auxiliary coil of high resistance surrounding core for overcoming magnetic inertia without producing saturation or polarization thereof, core being in series with motor.

ORE SEPARATOR.—No. 703,084; C. C. Pratt, Portland, Ore.

Apparatus for separating metals from ore, gravel, loam, combination of conduit, sluice arranged to receive from conduit having grizzly disposed below same, having riffle sections arranged end to end on bottom susceptible of being raised; riffle sections respectively comprising board having openings, longitudinal zigzag walls connected to under side board forming tortuous channels, one or more transverse strips connected to and depending from board, screen connected to upper side of board, one or more transversely disposed inclined boards arranged in sluice disposed slight distance above riffle, adjustable devices adapted in one position to retain riffle sections in their operative position on bottom of sluice, in another position to permit riffle sections being raised, suitable means on sluice for raising riffle sections.

WHEELED SCRAPER.—No. 703,352; T. D. Radcliffe, Lawrence, Kansas.

Combination with arched wheel carrying axle, pan pivotally suspended from axle, automatically operating locking means carried on pan for engaging axle to hold pan to upright position, pan frame, platform mounted on frame having stud members 18, draft frame 16, wheel engaging frame 20, including transversely disposed crossed members, having movement in their longitudinal direction, ends terminating in wheel engaging grips 20^d 20^e.

ELEVATED CABLE SYSTEM OF TRANSPORTATION.—No. 703,222; T. Alexander, Bismarck, Miss.

Overhead cable system of transportation, combination with series of stationary frames or supports of cable, series of grooved sheaves held on supports around which cable is wound, dogs pivoted on opposite sides of sheaves adapted to engage with cable section encircling sheaves, crossing on upper side of latter, two windlasses applied to cable supporting frame which is intermediate terminals of line, means for locking windlasses, sheave 14 arranged adjacent to one of cable supporting sheaves 2, anti-friction sheaves arranged on frame below each 2, cable passing over several sheaves beneath supporting sheaves 2, secured to windlasses, looped between latter.

DRY ORE CONCENTRATOR.—No. 703,356; R. E. Waugh and E. Waugh, Denver, Colo.

In dry ore concentrator, combination with air chamber, of endless apron arranged to close at top, comprising body part of fibrous or other material adapted to allow air to pass therethrough under pressure, rubber strips attached to edges of apron, each having two flanges extending approximately at right angles to each other, one of which flanges projects above concentrating surface of apron and maintains ore thereon, other flange secured to edge of apron, rods or reinforcing pieces extending transversely across apron on inner surface, their extremities being attached to outer edges of apron, straps composed of leather attached to edges of apron on its inner surfaces.

Deep Borings in the United States.

The deep well borings of the United States, made for water, oil and gas, are the subject of a statistical report by N. H. Darton in the series of water supply and irrigation papers of the United States Geological Survey. The list of deep wells is arranged by States, in alphabetical order, and appears in two pamphlets known as Water Supply Papers Nos. 57 and 61. All wells 400 feet or over in depth are carefully listed. Depth, diameter, yield per minute, and other characteristic data are given, and many instructive details are noted indicating for what purpose the borings were originally made, the character of the product obtained, and whether the wells are in use or abandoned. For the benefit of persons desiring more detailed information concerning wells in any particular region, references are given to the literature or other sources from which the data were obtained. The large product of natural gas in the East and the West, the enormous output from the oil fields in California, Texas and the East, and the considerable and indispensable water supply furnished by the deep wells on the plains and in the arid and humid States, make concise and accessible information of this nature valuable for economic and scientific purposes.

NEARLY every great improvement to which the world owes its present prosperity has fought its way against clamor, knavery and contempt. But anything and everything has ultimate success in exact proportion to its merit.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALABAMA.

Birmingham states: "According to the report of President Flynn of the United Mine Workers, about 11,000 miners in the Birmingham district have obeyed the strike order which went into effect July 1."

ALASKA.

(Special Correspondence).—The season's output of gold, according to conservative estimates, will be \$1,000,000. The principal pay came from the Snowflake fraction, which produced \$50,000; the Sugar, Molasses and Daisy claims, all on the divide between Anvil, Dexter and Nekla gulches, producing \$125,000, for the winter season. Forty thousand dollars was taken out of a bench claim below Specimen gulch on Anvil creek, owned by Dr. Southward, former Deputy Recorder of the Nome district. Smaller amounts have been produced from benches on Bourbon, Dry, Cooper, Saturday and Newton gulches. In a few instances shafts to the depths of 100 feet were sunk and pay found on bedrock. Solomon river benches have also proven to be productive. In bench off No. 8 below, nuggets to the value of \$30 and \$40 have been found. Ophir creek has also contributed largely to the output of gold.

The season is nearly four weeks earlier than last year, the snow is nearly all disappeared, and the conditions in general are quite satisfactory for a good summer season. Judge Wickersham has cleared the calendar of all old litigations, and it is to be hoped that Judge Moore will continue the good work inaugurated by Judge Wickersham.

Chas. D. Lane's pumping plant is nearly completed, at an expense of nearly \$500,000, and will be in operation in a short time, conveying water from the Snake river to his Anvil creek mines.

Candle creek has so far only speculative value, no additional information having been obtained than that of last fall. There will be, however, quite a rush into that section this summer.

There is enough labor here for any purpose this season. Wages will not be any higher than last summer, viz., \$5 and board for a day of ten working hours.

Nome, Alaska, June 15.

W. A. Boyce had a narrow escape from drowning May 23, at Nome. He had been prospecting the sea bottom close along the shore line near the Wild Goose section, and failing to get results with a sand pump, conceived and built a diving bell along lines of his own. The machine is 6½ feet high and 3½ in diameter, made of iron, and weighted with 2000 pounds of rock is lowered into the sea. Inside a man, supplied with air from a pump above, can work comfortably. While Boyce was being lowered into the water the device broke, but after one-half hour's work he was rescued.

Between Nome and Nome river there are 300 men at work on the beach with rockers and sluice boxes. Of the latter there were thirty strings. As to the results obtained by the miners little is known, they are not saying much as to what they find in the ruby sands.

J. T. Lindseth, mail contractor between Teller and Kotzebue, states that he saw \$50 offered for a sack of flour at Candle, but that price was refused. There are plenty of beans, bacon and cornmeal in the camp, however. He left Candle May 3, followed the Fish river route as far as he could, and when traveling by the river became impossible, with his three reindeer, he crossed the mountain direct to Council. From the latter place he again travelled across the country to Nome. He met scores of mushers, many of whom were packing food on their dogs' backs, having abandoned their sleds.

P. S. Early of the Bessie G. M. Co., Douglas island, will buy a motor and machinery, Yankee Cove showing up satisfactorily. A tramway will be built from the mine to the mill this summer and ten stamps added.

ARIZONA.

COCHISE COUNTY.

Last week at the Copper Queen Con. M. Co. a \$12,000 fire destroyed the miners' change room and contents, rope houses and contents, about 200 feet of car track and several hundred feet of mine timbers. Miners on shift in the Czar shaft had their street clothes in the change house, and those off duty had their working clothes there. The loss to the miners is estimated at \$3000.

The new bank at Douglas is in operation, L. C. Hanks cashier.

GILA COUNTY.

A special topographic map of the Globe

mining district, this county, has just been issued by the U. S. Geological Survey. The map is drawn on a scale of somewhat less than 5½ inches to the mile, and shows in great detail the features of the topography and the locations of the mining interests of the region. All the trails and roads are clearly shown, as are also the mines, smelters and numerous prospects scattered over the region. The map is now available at 5 cents a copy by addressing U. S. Geological Survey, Washington, D. C.

MARICOPA COUNTY.

The White Gold M. Co., on the Agua Fria, above Wickenburg, has a tunnel in 135 feet, with ore showing free gold.

MOHAVE COUNTY.

At the McCrackin mine, near Signal, men are sampling and measuring the ore body, pending a projected sale of the property.

C. E. Lundborg is in Kingman buying supplies and teams for the Salt Springs M. Co., Gold Basin mining district.

Teams and supplies have also been sent to the El Dorado mine, Gold basin.

The Lucky Boy at Chloride is shipping ore.

At the Gom mine, Chloride, sixty animals are carrying ore to the C. O. D. mill, 8 miles distant, over a mountain trail. The packers receive \$4 per ton and make one trip a day. The ore runs \$30 in gold.

YAVAPAI COUNTY.

Eight miles of the road is completed from Mayer to the Crown King mines. Total length of extension, 25 miles. The last 6 miles of the road will require the most work and time, as heavy grading and a great deal of tunnelling will be done. The road opens a good mining country, and is stimulating owners to action.

Prescott reports that the Iowa M. & D. Co. has the Conger mine, and expect to open the old workings and make a mine of it. The Monarch G. & C. M. Co., adjoining the Conger on the north, is sinking a two-compartment shaft 500 feet. The Lion Co., operating near by, has a new 7x10 hoist. The Coronado G. & C. M. Co. may spend \$100,000 on its mines on the western slope. It is backed by Prescott men.

The Wheel of Fortune group, some 3 miles south of Prescott, has been secured by Hartford, Conn., men, who expect to have a stamp mill on the property.

Supt. Symington, Grand View M. & M. Co., Cherry creek, will sink shaft 500 feet deeper.

Supt. M. Bradley of the Lion G. M. Co. is operating Bardshar mine, Cherry creek. C. Timmons of Prescott is Supt. Copper Prince M. Co., Hillside. The ledge is 20 feet wide; the ore carries 10% copper, \$6 gold and silver to the ton.

The Iowa G. M. & D. Co., L. M. Wambacher manager, has bought two groups of claims in Cherry Creek district, near Prescott, and will develop them.

CALIFORNIA.

AMADOR COUNTY.

W. A. Nevills and J. P. Johns have sued W. Fleming, D. C. Nichols, C. W. Cowles and J. D. Bost for \$150,000, on an alleged agreement of plaintiffs to buy one-half the capital stock of the Amador T. & M. Co. and Hamilton G. M. Co. for \$250,000.

Near Sutter Creek, the Mitchell mine has resumed operations.—The Amador-Phoenix is running levels at the 100-foot station.—At the McKenzie mines, Nos. 1 and 2, the tunnel is in 200 feet on the vein, the ore assaying \$8 to \$12 in free gold and sulphurets assaying \$55 per ton.—Ore 5 feet wide is reported in the Edinburgh shaft that gives milling tests of \$82.

Supt. Parks of the Kennedy, at Jackson, now has the deepest mine shaft in the State—2550 feet—but now proposes to go deeper, and has ordered a new hoisting plant with sufficient capacity to sink 4000 feet. He will also have new steel headgear.

The ledge has been reached on the 850-foot level in the Fremont shaft, near Drytown. Some of the ore assays \$150 to the ton.

The Dispatch says a new steel gallews frame and hoist is in contemplation at the Gwin mine.

In the drift from the east shaft of the Kennedy mine, on the 2450-foot level, the ledge has been found, said to be a repetition of the ledge at the 2550-foot level.

W. Stirnman & Bro. have commenced a crosscut tunnel to strike a shoot of ore 100 feet below the present workings.

A 10-stamp mill for the Defender mine goes in next month.

L. C. Hyner has charge of the Mitchell mill and mine, near Jackson.

BUTTE COUNTY.

Near Oroville, J. I. Booge, who had \$3500 to pay for the Garden City, has returned to Los Angeles, the investment having been deferred.

Oroville reports that what is locally sur-

mised to be the first stop toward the building of a railroad up a branch of the Feather river, connecting with the overland at Reno or Boca, was the filing in the Butte county recorder's office on the 1st of eighty-four placer mining locations, all signed by the same persons and embracing a tract lying along the north fork of the Feather river.

A. J. Waterhouse is adding twenty-five stamps to the Golden Trout mill, and by Sept. 1 thirty-five stamps will be crushing ore.

CALAVERAS COUNTY.

Near West Point, the Yellow Aster mine is sending ore to the Nixon mill.

Work has begun on the Lloyd mine at Central Bill. A 250-foot double compartment shaft will be sunk to the gravel, under charge of J. Jackson.

The Last Chance mine, Angel's Camp, is to be developed.

EL DORADO COUNTY.

R. Smith, near Omo, is getting out ore, ready to crush as soon as water can be had.

The Gold Bug mine, Georgetown, has resumed after a temporary close-down.

McKenney & Grube are developing the Stuckslager mine, near Lotus.

Work at the Horseshoe Flat mine, Newtown district, has been suspended for the present.

The Placerville Democrat says: "F. E. Huber has thrown up his contract to extend the big tunnel to the River Hill works. The contract price was all right, but the ground was too hard for the contract price."

KERN COUNTY.

At Randsburg the Miner says there are 175 men on the payroll of the Yellow Aster mine, including the pumping stations.

Messrs. Bethune & Holt made a recent trip with a train of burros through Death valley direct from Tonopah, fourteen days. Traveling in the day was out of the question. Following is their itinerary, which is a matter of some interest: Leaving Tonopah they took the trail for Stonewall mountain 45 miles, then to Chadwick mills 30 miles, then south 64 miles to the north end of Death valley, 5 miles to Mesquite springs, 8 miles to Stovepipe springs, 20 miles to Death Valley ranch, near Coleman's Borax Works. These works shut down in April for the summer, and will start up when the weather becomes bearable. From this point they crossed the valley to the west and took the trail to Blackwater, 16 miles, thence 14 miles to Wild Rose springs, 10 miles to Warm springs, 7 miles to Ballarat, thence to Randsburg.

The Jewett & Blodgett refinery is turning out hard asphalt.

LOS ANGELES COUNTY.

The Red Rover mine at Acton is again in operation.

The Standard Oil Co. will build a 6-inch pipe line from the Fullerton oil fields to San Pedro, 35 miles, and a branch to be run to Whittier.

NEVADA COUNTY.

W. F. Snyder, manager Western Exploration Co., says he has the Red Cross group of gold-bearing mines. A plant will be erected next season.

H. Thomas will superintend operations at McAvoy & Co.'s Standard mine, near the Jenny Lind, Grass Valley.

The Providence M. Co., the Providence G. M. Co. and the Providence G. & S. M. Co. have filed incorporation papers. These companies were incorporated in San Francisco in 1863: capital stock, \$124,000.

Grass Valley papers say there is not an idle miner at Washington or Maybert.—The Grey Eagle has started up. A 10-stamp mill is being graded for.—The Red Cross has resumed operations.

The business part of Washington was destroyed by fire on the 30th ult.

PLACER COUNTY.

The 20-stamp mill at the St. Patrick mine, near Washington, has been taken to Black canyon, near Forest Hill, where it will be erected on the property of the Black Canyon quartz mine. A ditch and flume will be built to bring water from Secret canyon to run the mill.

In the Hidden Treasure drift mine, Centerville, the tunnels at Sunny South and Centerville are operated on a large scale; 180 men are employed. The face of the tunnel at Centerville is in 10,100 feet; breasting operations are carried on at 8000 feet. During May 10,633 tons of pay gravel and 806 tons of waste were extracted—a daily average of 440 tons. The company are working six treasts. The electric plant, cost \$20,000, is a success; capacity, 200 H. P., generated by dropping water from a ditch with a flow of 90 cubic feet per minute, delivered to a water wheel under a vertical head of 850 feet.

Supt. H. M. Jarvis has twenty-five men employed at the Bob Lewis gravel mine, at Red Point, on the same channel as the

Red Point Co. The tunnel is 1300 feet in length; gravel is reached by an upraise into the channel; fifty tons of gravel are daily taken out.

PLUMAS COUNTY.

C. R. Thompson is running his quartz mill near Rich Gulch on good ore.

SAN BERNARDINO COUNTY.

The Los Angeles Mining Review states that the new eighty-ton smelter at Oro Grande has been blown in. J. Bailey is manager. The smelter was built by the Llewellyn Iron Works.

SAN DIEGO COUNTY.

Receiver C. W. Pauly of the Golden Cross mine has filed his fourteenth monthly report in the Superior Court at San Diego. It covers May, and shows receipts of \$13,487.42, of which \$11,693.37 was bullion from the cyanide plant. The disbursements amounted to \$8322.31 for labor and supplies.

SAN MATEO COUNTY.

Halfmoon Bay reports that a Guiberson, Sallee & Hayne well, Purissima canyon, is flowing at a rate of 1000 barrels a day 54° oil from a depth of 800 feet.

SANTA BARBARA COUNTY.

Piping the entire product of the Western Union Oil Co. in the Careaga field, near Los Alamos, to the Alcatraz refinery, on the coast near Gaviota, is projected; about 2000 barrels per day. Since the collapse of the trust the Crockers of San Francisco have resumed control of the Alcatraz properties, including the refinery, the pipe line to Sisquoc and the mines at the latter point. Instead of mining asphalt, part of the pipe line will be taken up and relaid to connect with the Western Union Co.'s pipe line, now extending to the narrow gauge railway at Blake station.

SHASTA COUNTY.

The Oregon & Montreal G. M. Co., operating the Ashland mine, has new power plant, hoist, air compressor and machine drills. Sinking in the main shaft will be continued and stoping will be carried on on the 775-foot and the 875-foot levels. With this new plant the company can go down 2000 feet.

Supt. E. V. D. Johnson says bids will be opened in San Francisco on the 10th for the electric plant, to be built by the Northern California Power Co., near Whitmore, capacity 4000 H. P. The electricity will be generated by water power from a 4000 foot pipe line from South Cow creek.

Supt. Johnson says the transmission line will be run to the mines and smelter of the Bully Hill C. M. & S. Co., and other mines of the section and the towns of De Lamar, Sallee and Copper City. From Bully Hill the line will be run southward to Palo Cedro, where it will connect with the main transmission line now in use.

Manager Snider and Supt. Adams have been inspecting the Balaklava Copper property, which has considerable ore blocked out. P. Kimberly, president of the corporation, which has a bond on the property, will visit the mine next week, after which the proposition to build a smelter will be discussed.

T. G. Parker says that an electric railway will be built between Redding and Keswick.

W. Moran, manager Oro Fino M. Co., near Shasta, says he will put in a stamp mill and, later, a cyanide plant.

The Iron Mountain mine is paying muckers \$2.50 per day.

SIERRA COUNTY.

It is reported that the blue gravel channel is found in the Swansea mine.

In the Hilda mine, near Downieville, lying idle for years, leased by Mackey & Davine, a strip of ground 80x30 feet gave \$2000, mostly in coarse gold.

The ledge is reported struck in the lower tunnel of the Plumhago mine. It will require work to determine its extent and value.

SISKIYOU COUNTY.

Supt. E. D. Baker, Cherry Hill quartz mine, Cherry creek, has a ledge of free milling ore at a distance of 1500 feet from the mouth of the tunnel.

Green & Harrison, porphyrydike mine at Deadwood, have five ounces of gold from a week's work.

A. C. Brokaw is running his quartz mill at Hull gulch, and operating his hydraulic claim with giants and elevators.

STANISLAUS COUNTY.

The Stanislaus W. & P. Co., it is announced, will begin operations shortly with 500 men, if they can be had. They will pay \$2.50 per day.

TRINITY COUNTY.

F. P. Burris is Supt. Valencia C. M. Co., east fork of New river.

Supt. W. P. Gester is moving the Bullychoop M. Co.'s 10 stamp mill to the South Fork of Indian creek; ten additional stamps will be added. The new equipment includes 3000 feet of tramway from

Supt. J. Porter of the Fairview mine, Minersville, has machinery for a new 10-stamp quartz mill on the road. Fifty-five men are employed—twenty-five at the mine and thirty on outside work. The present working level to the new mill-site.

TUOLUMNE COUNTY.

J. H. Darrow has bonded to C. Hampton for \$8000, payable before Dec. 31, 1905, the Darrow mine, at Rawhide. The Mohican M. Co., through Supt. F. Chappellet, Jr., will petition the county for a new bridge over the Tuolumne river, near the mine.

At Stent the fire in the Jumper mine caused only temporary cessation of work, resuming to-day. Forty stamps are running on ore from the Jumper & Golden Rule.

Supt. Moore is preparing to operate the Green mine, near Sugar Pine.

At the Shawmut mine forty stamps are being added to the mill; sixty stamps have been dropping for some time, besides the original forty. There are over 200 men on the payroll.

Near Columbia, the break in the flume of the Star mine is being repaired.

YUBA COUNTY.

The Eagle Canyon G. M. Co. has let a contract to H. P. Barker to put in the necessary flumes at the claim in the channel of Yuba river, south of Dobbins Ranch.

COLORADO.

St. Louis asserts that \$1,000,000 worth of gold bars, just as they come from the smelter, will form the apex of the pyramid of the Colorado mineral products to form the central figure of the exhibit from the State in the mines and metallurgy building at the World's Fair in 1904. The interest on \$1,000,000 for six months at 5% would amount to \$12,500.

BOULDER COUNTY.

Manager Lake of the Boulder County mine, Wall Street, has his mill in operation.

The Boulder-Amazon well is now down about 170 feet and still sinking. The Boulder-Petroleum well is in oil at a depth of 650 feet.

CLEAR CREEK COUNTY.

Near Idaho Springs, Supt. Pickett, International M. Co., is driving first level drifts east and west on the Morgan mine. The Golden Lily mill, Brinkerhoff & Preston, at Alice, is operating twenty stamps.

Manager Roller will rebuild the Shafter shafthouse and put in new machinery.

G. W. Crawford has an option on the Benton mine, Silver mountain. It has a 600-foot shaft and many hundred feet of drifts. It has been idle fifteen years. There will be a test of 1000 tons of different grades of material; the result will serve as a guide for the erection and equipment of a plant adapted to the treatment of the ore in sight and awaiting development.

Near Georgetown the Courier reports the Kelly tunnel pushing ahead 7 feet per day since the drills were started.

At the Centennial Manager Kennedy is retimbering 300 feet on the 400-foot level.

At Montezuma the Rothchilds Co. under contract to Maxwell & Cleaves has the tunnel in over 1000 feet.

Near Empire is completed the crosscut on the Conqueror group to connect the workings of the Patsey and Conqueror veins. Fifteen men are drifting in both directions on the vein from the new opening for the short cut by the old tunnel level. The final transfer of the Conqueror property to the Milwaukee parties, represented by E. M. Brown as general manager, will soon be made.

Near Empire the Ruby lode has been cut by Ruby tunnel in Douglas mountain. Supt. Burgess has opened at an elevation of 400 feet above the tunnel the same vein; the Johnson tunnel, owned by the same company, will cut it 350 feet deeper.

Manager G. Sinclair of the Nero-Philadelphia M. Co. has acquired control of the Rosecrans property, Silver mountain. The vein shows a width of 20 feet. The new management has opened up 3 feet of low-grade ore to be treated at the Golden smelter.

Near Silver Plumework is resumed on the Stevens mine by E. J. Wilcox, the owner. The tunnel will be pushed through McClelland mountain to intersect different properties in East Argentine owned by him; this means about 4000 feet of tunnel work and will be used as an outlet to the East Argentine mining district. The mine produces lead ore with values in gold and silver.

The Wisconsin is making weekly shipments of fifty tons that average 300 ounces silver per ton.

J. H. Towne will open up the Indiana lode on McClelland mountain.

Idaho Springs reports an electric line projected up Fall river to Yankee. The management of the Burlington Railroad

Co., representing the Alice mine, is reported instrumental in the construction of the line.

CUSTER COUNTY.

At Custer the Bull-Domingo mine, operated by the Neptune M. Co., is in operation.

The mill completed by J. Lacy at Westcliffe has a daily capacity of fifty tons.

The Toledo, adjoining Custer on the east, has been started up after being idle several years.

EL PASO COUNTY.

(Special Correspondence.)—The Telluride Reduction Co., Colorado Springs, under the management of H. W. Fullerton, which has lately started up, find they are unable to handle all the ore they can obtain, and have decided to increase the capacity of the mill from 30 to 500 tons. Building will commence in about three weeks. The ore is treated by the chlorobromination process. They are now treating ore that assays \$7.25 per ton with a profit to the miner as well as to themselves. Mr. Fullerton claims they can handle ore running \$5000 to the ton or higher.

A visit to the Portland mill, Colorado Springs, shows two of their furnaces in operation, and they hope to have the third one running in about thirty days. Everything is working smoothly as far as they have started up. When the mill is running full capacity they can handle 300 tons per day. They expect to handle the ores from the Portland mine exclusively.

J. D. Hawkins, Supt. of the Colorado and Standard plants of the U. S. Red. & Ref. Co., Colorado City, states they are handling 800 tons of Cripple Creek ore every day, and plenty of ore on hand.

Colorado City, June 28.

The United States Smelting Co. say they will build a \$1,000,000 zinc-lead smelter to handle the by-product of zinc-lead derived in smelting gold and silver-copper matte along the lines now carried out by the zinc-lead smelter at Canon City, either there or Pueblo or Colorado City, probably the latter.

FREMONT COUNTY.

The Union plant, Florence, under the management of J. Q. MacDonald, is handling the usual number of tons of ore daily.

The Dorcas M. M. & D. Co. are handling 100 tons per day of the Cripple Creek district ores. The Dorcas is the only cyanide mill running at Florence at present.

One-fourth interest in seven claims belonging to the Florence-St. Elmo M. Co., Buena Vista, Cottonwood district, is sold to M. Norton and J. F. Gahrin of Wheeling, W. Va., for \$15,000. J. T. Erickson will be in charge of the property. The Philadelphia smelter at Pueblo will handle the ore.

A new mill with a new process is being built at the western end of the Royal Gorge, west of Florence, by the Greenhorn M. & M. Co., which owns mining property near the mill, in proximity to a dike running through the chain of Greenhorn mountains, for treating copper ore.

GARFIELD COUNTY.

The Pochontas coal mine at Cardiff has been sold by Receiver Parks to A. V. Hunter of Leadville for \$23,300, and takes in all of the property of the Pochontas Coal M. Co., including the new tramway built last year. The mine has never paid expenses except under the management of Receiver Parks.

GILPIN COUNTY.

R. M. Collins, manager Scandia mine at Central City, reports the strike of a vein of ore running \$150 per ton.

Central City reports the Boston-Cleveland M. & M. Co. has bought the Morning Star property, at the head of Elkhorn gulch, for \$16,000.

The Gettysburg property at Gilpin will be worked this summer. Work has resumed on the Wizard tunnel at Gilpin.

Several men are locating mining claims at the upper end of Boulder park.—The Miners' Supply Works at Black Hawk is buying ore to ship to the National smelter, South Dakota.

J. H. Johnson will erect a new shaft building and install machinery on the Bant property, east of Black Hawk.

At Black Hawk machinery for the independent sampling works is in place.

The Cook shaft of the Boston & Denver Con. M. & M. Co. will be extended to a depth of 1200 feet, where connections can be made with lower workings of the Fisk and Gregory-Bobtail properties. Enough ore is being taken out to keep forty stamps dropping.

The Colorado Carr Co. has bought the Golden Fleece property for \$15,000 cash.

Supt. T. Dunstone at the Running Lode mine, below Black Hawk, has a station cut at the ninth level—a depth of 725 feet. Thirty-five men are working. The average monthly production of 150 tons of concentrating ores is treated at the Newton mill, Idaho Springs, and 80 tons of

smelting ores go to the local sampling works or direct to the smelters.

GUNNISON COUNTY.

Supt. J. C. Jensen at Forest Hill has the shaft down 350 feet and is producing enough ore to keep the fifty-ton mill busy. The ore is lead-zinc, carrying gold and silver. Thirty-two men are at work.

Gunnison reports that the Tomichi Valley Smelting Co. has resumed operations with its fifty-ton smelter near Whitepine. On the Colorado Mines Consolidated plant, on the Cochetopa, machinery will be put in. At the dump of the main tunnel it is estimated that there is 4000 tons of \$12 ore.

Near Gunnison the Dubois T. M. & M. Co. has resumed on the Dubois tunnel, now in 1260 feet, and which has cut several veins averaging \$10 gold per ton.

The Iron Cap mine, last year operated by the Grafflin Co., will be worked this season.

The Elko 50-ton concentrator, Elko district, is to be operated soon by the Rock Creek Investment Co.

A. C. Brownell will operate the Iron Bonnet mine on Gold hill, Tin Cup district.

W. W. Burr is operating the Brittle silver mine, near Woodstock, Tomichi district.

HUERFANO COUNTY.

Walsenberg reports great activity on the north side of Grayback mountain. Within a circuit of 2 miles from the Copper Bull mine, under the general management of C. O. Unfug, there are several outfits operating machine drills and compressors.

LA PLATA COUNTY.

The Neglected mine at Oro Fino is reported to show profits for April of \$17,000 from an output of four tons per day. There is stated to be a breast of 8 feet of ore in the drift which averages nine ounces gold per ton.

Durango reports shipment of one carload of high-grade ore per week by the Mountain Lily.

LAKE COUNTY.

The Leadville News-Dispatch says: "Mr. Mankuss has had two different mining agents call on him during the week and try to sell him the Helen Gould mine, which they claimed was the richest ore producer in the world. Mr. Mankuss holds the deed to the mine; Hensley & O'Brian hold the adjoining claims, so that the agents are evidently frauds."

The New Leadville M. Co. will put in a diamond drill on the O'Brian claim.

Leadville reports that on Sugar Loaf mountain Manager Horner of the Dinero Leasing Co. is developing the vein on a large scale. The shaft is 410 feet deep. Since taking hold over 1500 feet of stoping and development work has been done.

At Leadville, W. F. Crispell will reopen the old Oro mill.

Near Leadville the Arkansas Valley smelter, the largest in the State, will be enlarged and capacity for treating low-grade ores increased. One thousand tons of ore are now being treated daily. The improvement will enable the company to handle 1400 tons. New roasters will increase the roasting capacity to 400 tons daily.

The Fryer Hill M. Co. is pumping 1200 gallons of water per minute from the El Paso shaft, lowering the water 2 feet a day. Manager Newell expects by Sept. 1st to be shipping ore.

Mr. Ihseng, the American representative of the Vieille Montagne smelter of Belgium, the largest zinc plant in the world, is making an examination of the Leadville zinc situation with a view of making some contracts for zinc. The Belgian plant has not bought any ore there yet.

MESA COUNTY.

Near Grand Junction D. Bishop will superintend work on the Last Chance and Francis mines, taking out gold and copper ore.

OURAY COUNTY.

Near Ouray, the American-Nettle mine buildings were partially destroyed by fire on the 25th ult.

At Ouray the Home pyritic smelter will resume work next month.

PARK COUNTY.

Near Alma the Golden Era, owned by Dr. McLean, has a vein of ore 6 feet wide, affording 1500 feet of stoping ground above, fifty ounces lead, one-half ounce gold. The London mine recently paid a dividend of \$1.15.

SAGUACHE COUNTY.

The Little Sisters G. M. Co. are operating in the Bonanza district and have ore running \$13 per ton. This ore is treated by the smelters for nothing on account of the fluxing character of the ore. The ore carries a high percentage of lead.

The San Isabel mine, 3 miles north of Crestone, developing with air drills and good miners, with a tunnel in the mountain over 2000 feet, has cut the Bernard

vein at a depth of 600 feet. Assays from the outcroppings have given returns of \$8 and \$10 in gold and copper.

SAN JUAN COUNTY.

Near Silverton the Pittsburgh M. & M. Co., on Brown mountain, has bought the Kentucky Giant group, near Gray Copper falls, and will do development work thereon under the supervision of W. Riggs.

SAN MIGUEL COUNTY.

Telluride reports 200 feet of bedrock stripped at the Keystone placer. The new mill at the Tomboy will be finished next month.

In the Cincinnati, Columbla and Argentine mines, by the time the new mill is finished, considerable ore will be ready for extraction.

Near Telluride the manager of the Japan tunnel expects this month to lower the State record held by the Newhouse tunnel at Idaho Springs. The average distance made per day is 9 feet—2 feet more than ever driven in the San Juan country in the diorite or trachyte formation that prevails throughout the district. Two shafts are employed; the motive power is compressed air. The manager expects to drive over 300 feet this month.

Rodgers & Breckenridge have men on the Royal group, in Bridal Veil basin. The veins are 6 feet wide and carry gold, silver and lead.

The compressor bought from the Mel-drum Tunnel Co. by the Ophir Con. M. Co. is operating the Silver Bell machine drills for developing the Ida and Silver Bell.

SUMMIT COUNTY.

Mgr. A. M. Campbell of the Mine Developing Co. of Montezuma is shipping fine high-grade silver-lead ore.

Manager Stearns, Leadville, expects to open up work on the Klondike, in Clinton gulch. Nearly \$75,000 has been invested in this property by Chicago men.

Green Mountain is a new town on the Blue river, 40 miles north of Breckenridge, where a new gold camp has been opened up. There are two nearly parallel dikes of phonolite crosscut and intersected by fissures filled with porphyry, and from 10 to 40 feet wide. There are four companies and 30 prospectors at work.

W. A. Johnson has started up the Uthoff mine at Kokomo.

At Robinson the new smelter is running on ore from the Robinson mine. In operating the mine and smelter the Robinson Co. is employing 125 men.

The Ten-Mile Leasing Co. will sink its lower workings 200 feet deeper.

The Journal reports that at Swandyke the Gold Cup group of claims has passed into the hands of a California corporation, stocked at \$1,000,000. Under the terms of the transfer, the company is obligated to expend \$6000 on the property by December 31, 1902.

TELLER COUNTY.

(Special Correspondence.)—The mining public will be interested in the outcome of the celebrated mining case which is attracting national attention, known as the Hull City placer claim, and which President Roosevelt has interested himself in to the extent that he has read all of the papers pertaining to the case and assured James A. Ownsby, a mining man of Denver, Colo., that the case will be reopened and referred to a court of competent jurisdiction for trial. The territory in dispute is situated in the Cripple Creek district. The statements made by Mr. Ownsby and associates are that the territory in question was located as placer ground, when in fact it is lode claims or veins; that no placers have ever been found in the district, with but one exception. Some ten or twenty claims were located in the territory afterward known as the Hull City placer. The property so located was transferred to the Independence Town & Mining Co., which afterward became an applicant for a patent. The survey, supposed to have been made under the direction of the Pueblo Land Office, is attacked, and the charge is made that it was not legal, nor were the improvements properly appraised. In the contest which sprung up for possession there were a number of claims, including the Wilson Creek Con. M. & M. Co. When the contest reached the General Land Office the survey was set aside, because of the claim that it was improperly made, and that the improvements were not in accordance with the law. Mr. Ownsby secured options on the interests of all parties concerned, including the Wilson Creek Co. and the Independence Town & M. Co., with the idea of eventually perfecting a claim to all the lodes. He expended some \$87,000 in this connection. While the case was still pending the patent was issued, Mr. Ownsby claims, "upon misstatement of facts, misrepresentations and perjury."

An investigation of the facts leading up to the issuance of the patent was made by the department, and the charges of perjury and misrepresentation were substan-

lated. Special counsel was appointed to bring suit against the patentees, the special counsel being C. J. Hughes, Jr., and T. S. Dines of Denver. The case was compromised. Indictments were found against some of the participants in the scheme and the whole State became interested. An effort was made to have the men indicted nolle prosequed, but this proved unsuccessful. The Interior Department also refused to dismiss the proceedings which had been started against the patentees. Mr. Owensby endeavored to have the whole matter thrown into the courts, but the Attorney-General, Mr. Knox, refused to act. For this reason Mr. Owensby went direct to the President with his case. Should Mr. Owensby win his case it means that some prominent men of Colorado are liable to find themselves in serious trouble, and that the United States Government will receive about \$3,000,000. Mr. Owensby is represented by W. S. Teller, Denver, T. B. Reed of Maine and J. S. Blackburn of Kentucky. It will undoubtedly prove to be one of the most noted mining cases in the history of the Government.

Cripple Creek, June 28.

(Special Correspondence)—The Granite G. M. Co., D. L. McCarthy Supt., Victor, employs sixty men and will average 1000 tons of ore per month at a value of \$35 to \$40 per month. Mr. McCarthy expected to raise the output during the month of June to 1500 tons, but owing to the breakdown in the compressor at the La Bella plant, which supplies the Granite with air, they were obliged to remain idle for a few days, which will prevent them from making it 1500 tons.

Victor, June 24.

On the completion of their new working shaft Sept. 10th the El Paso Con. Co. will lease the entire southern area of their territory from the surface down to the tunnel level, 335 feet below the surface. The company will maintain its plant of machinery on the shaft, will give the lessees hoisting facilities, and they can buy machine drills if they desire to operate any.

Another Cripple Creek consolidation is proposed, the Big "4" Con. G. M. Co., New Century G. M. Co., Juanita G. M. Co., Transvaal G. M. Co. and Gladys A. M. Co. The new company will be known as the Amalgamated Gold Mines Co., capital stock \$25,000, incorporation under Wyoming laws.

The Granite and other mines which were supplied with air from the La Bella compressor at Goldfield are making up for lost time. When the breakdown occurred the Granite was outputting fifty tons per day, the ore running in carload lots \$50 a ton on an average. The breakdown did not affect the Golden Cycle, as there was broken a large tonnage. This mine is now outputting 125 tons a day.

The Bedford G. M. Co., in Bison Park, will put in a 20-stamp mill.

The Mineral Point G. M. Co. will build a 100-ton cyanide mill on their Copperhead property, Mineral Hill. They will begin work on their Joe Heath claim, on Bull hill, east of the Victor mine. A plant of machinery will be installed and the shaft sunk 300 feet.

A. H. Heller is building a cyanide plant on the Ironclad property near Cripple Creek.

W. S. Stratton has leased the Callie property on Gold hill for eighteen months.

At a depth of 760 feet connection is made between the Chicago-Cripple Creek tunnel and the Plymouth Rock on Ironclad hill. Ventilation for the mine and tunnel is now secured. The tunnel penetrates Globe and Ironclad hill 4200 feet.

In Cripple Creek the Moon-Anchor Co. has leased its Anna Rooney claim, adjoining the Conundrum of the Anchor-Leland Co., for two years at 20% royalties. The lessees will sink a new working shaft 200 feet.

The Doctor-Jack Pot Con. G. M. Co. has suspended work. All the men will be laid off from the Mattie D. vein.

At Victor, R. L. Patterson has started work on the dump of the old Victor mine. It has been previously worked over by hand, the present lessee will operate on a larger scale and wash and screen the rock. Tests show values of \$15 a ton.

The Little Sister G. M. Co. is operating on the southern slope of Battle mountain, adjoining Stratton's Independence. They are in ore that runs from \$5 up to \$50 per ton.

IDAHO.

Judge Beatty of the U. S. Circuit Court has dismissed the \$1,000,000 damage suit brought by Patrick Clark and others against the Buffalo Hump and Empire State Mining Companies. Clark charged Charles Sweeney of Boise with having used fraud and misrepresentation to purchase the Ella and Missing Link claims from him at a trivial price, when in reality they were of great value. He demanded the return of the claims, which

are valued at \$1,000,000. Judge Beatty, after hearing the arguments, ordered the suit dismissed. Clark will appeal.

BANNOCK COUNTY.

Pocatello reports a fight for the possession of the Belle Marsh copper mine on the recently opened Fort Hall reservation. Murray's men hold possession of the property with Winchester. Elliott says he will attempt to gain possession of the property. There is talk of one hundred prospectors and miners organized to assist him to take possession by force of arms.

BLAINE COUNTY.

J. B. Frank, manager Idaho Recovery Co., recovering values in tailings at Camas No. 2 mine and mill, Halley, by cyanide process, says the work that has been going on over five years will be ended Sept. 1.

Near Hailey final payment on the Hattie group of mines acquired by the Hollister syndicate will be made by James Black of Salt Lake.

Martin thinks that this year Lava creek district will go ahead. The Mayflower people are grading for the new stamp mill. Indiana people are putting in a smelter of 40 tons capacity, and employ about twenty men. There is the Alder Creek M. & M. Co. The building of the Mackay branch of the railroad will develop that part of Idaho. Arco, the railroad point, is 18 miles from Martin.

At the Rosetta mines on the South Boise and Big Smoky divide, F. R. Reed, the newly elected manager, has assumed charge of the property, and has ordered work discontinued until he can map out a plan of operations. C. C. Ruthrauff retains control of the company.

BOISE COUNTY.

First payment is made on placer ground on Boise river, above mouth of More creek, one-third purchase price, latter \$31,000, by New Hampshire and New York men. The company will put a dam in Boise river for an electric plant, fall 12 feet. Electrical power will run centrifugal pumps which will lift water to the placer ground, the bedrock of which is 30 feet above low water mark of the river. The water will be pumped 130 feet, giving pressure of 100 feet for mining purposes.

The Ingle Co., at Grimes Pass, is putting up a 60-ton Chile mill to be run by water power.

CUSTER COUNTY.

Near Mackay, in the mines of the White Knob Copper Co., the vein runs from 20 to 150 feet in width; average thickness of ore 30 feet. The smelter, which has a capacity of 600 tons of ore, will be blown in July 15. Preparations are being made to add two more furnaces of 200 tons daily capacity each, to give capacity of 1000 tons a day. There are 400 men on the payroll—200 being employed in the mines and 200 on the 12-mile electric railroad and at the smelter.

A subsequent report from Mackay states that last week the White Knob Copper M. Co. closed its mine, smelter and other enterprises and abandoned them indefinitely. The 300 employees will receive their pay in full and be discharged.

The new Supt. of the mines, F. Boyd, who suddenly displaced Supt. W. Darlington a month ago, says that the order to close came through him to J. A. D. Smith, Supt. of the smelter. Construction of the plant was begun last October. It includes an electric railway running up the side of White Knob mountain from the smelter to the mine, 30,000 feet of tunneling, 700 feet of shafting and a smelter with a daily capacity of 600 tons. It is estimated that \$1,000,000 has been invested in an effort to work the mountain of low-grade copper ore.

R. Macheth is Supt. Lucky Boy M. Co., Custer City. Eighty tons of ore go daily through the crushers.

OWYHEE COUNTY.

Manager Stevens of Silver City expects at the Addie mining property to have the mill running Aug. 10. The mill is planned to be automatic. The ore will be delivered directly from the mine tunnel to the rock breaker and grizzlies and fall thence into the bins, from which it will be let into the battery feeders, without handling. The depth from the car tracks, near the top of the mill, to the settler floor, is 46 feet.

SHOSHONE COUNTY.

The Mullan Mirror gives the following: The Cœur d'Alene mine owners and the smelting trust have agreed on the terms which will govern the output of the north Idaho lead mines for the next six months. The tonnage will be increased 20% and the price will remain 3½ cents a pound. The increased output will give employment to 150 more miners than are now at work in the district. The new deal went into effect on July 1. F. Burbidge of the Bunker Hill & Sullivan Co. and the Cœur d'Alene M. Co., working near Wardner, returned Wednesday from the lead conference in New York. "We wanted to

get an increased tonnage of 25% over the present restricted output," said Mr. Burbidge. "However, it was evident after our first conference that the smelting company would not accept such terms. Then the Cœur d'Alene mining men spent several days in New York discussing the matter among themselves, and at a later conference it took only a few minutes to close the arrangements on the basis of a 20% increase. That gives the mines a chance to produce 80% of what is assumed to be their normal production. For the first six months of the year the mines under contract with the smelting company were restricted to 66⅔% of their alleged normal tonnage. The Bunker Hill & Sullivan Co. is working 500 men; the Empire State-Idaho is working 175 at Wardner and 125 at Burke; the Morning has about 175; the Cœur d'Alene M. Co. 53; the Mammoth about 90 and the Standard and the Hecla about 250."

Wallace reports that under the new agreement the shipments of lead ores will again reach a point almost as high as at any time in the past.

At present the output of the district is 12,000 tons a month, the American Smelting & Refining Co. taking 10,000 tons and the Tacoma smelter 2000. Adding 20% to the amount taken by the trust will swell the shipments of the district to 14,000 tons a month, or 168,000 tons a year. During the year 1900 shipments ran up at one time to almost 18,000 tons a month, but the average for the year was only 171,412, or less than 3500 tons—2%—more than will be taken under the present contract. That was the year of greatest shipments, 1901 coming next with 148,890 tons. Ore shipped since the reduction of the output is worth more per ton than when the mines were running with a wide open market. The ore is being milled closer, giving a higher per cent of lead to the concentrates, due to better milling methods. An addition of each per cent to the lead contents of the concentrates means an addition of about \$4500 to the value of the month's shipment, and in some mills the increase has been as high as 5%. Thus, when the output was restricted, the mine owners had it within their power to add \$250,000 to the value of the year's output at a very trifling expense.

Local estimates are that the increased output will furnish employment to 400 more men.

The Wardner townsite case before the Cœur d'Alene land office has been won by the town. The applicants for patents of mining claims running across the town have appealed to the Secretary of the Interior. Register Budlong's decision gave the city the surface rights and the lode claim owners the ore in their claims. The claim patentees maintain the claims are worthless without surface rights to work them.

Work is being pushed by the Vindicator M. Co. 2 miles east of Mullan. The ledge is 10 feet wide 100 feet from the surface. The upper tunnel is in 375 feet and the lower tunnel 150 feet. It is a silver-lead proposition.

Pierce City reports that the Wild Rose mill's clean-up of 12 tons of ore showed 12½ pounds gold, valued at \$2300. The Wild Rose is 4 miles from Pierce City. From a 2-stamp prospecting mill clean-ups, aggregating \$15,000 are said to have been made.

The New York conferences between lead producers of the Cœur d'Alene district and the American Smelting Co. resulted in an agreement for the ensuing six months similar to that which has obtained heretofore.

WASHINGTON COUNTY.

Thunder Mountain reports that F. J. Conroy went to Thomasville, North Carolina, there bought a 100-stamp mill, and is sending it to the Belle of Thunder Mt. mine, all of which may be so. The assertion is also made that "a train of over thirty cars, with streamers attached," will carry the mill to Nampa. Just what the "streamers" are for is not stated.

E. D. Ford, manager Idaho Gold Col. mines, Black Lake, has three cars of tram fixtures, cable and pipe for the mill. The road is buried under snow. He has men plowing out the snow with a 16-inch plow and fourteen horses.

MONTANA.

The value of the gold, silver, copper and lead produced for the year 1901 was \$60,-387,619 01—\$4,802,717 39 gold, \$18,334,-422 26 silver, \$36,751,837.34 copper, \$498,-622.02 lead. As compared with the production of 1890 the decrease is about \$3,000,000, due to the lessened production of copper. Since the discovery of gold in Montana forty years ago about \$1,000,000,000 has been taken from the streams and mountains of the State.

BEAVERHEAD COUNTY.

Near Dewey the Ajax Mining Co. has bought the Climax mill, and are hauling it to their property in the Big Hole basin.

The Montana Power Transmission Co. are working twenty men on their reservoir and flume on Wise river.

Laughlin & Albers have sold their placer mine, near Argenta, to W. Hogan for \$3000.

BIG HORN COUNTY.

N. P. Stilson, manager Gold Reef M. Co., Greybull creek, has let a contract for driving a tunnel 150 feet on the vein.

CASCADE COUNTY.

P. Gibson, W. C. Conrad and T. C. Power have sold the Barker mine at Barker to New York men, who will resume work upon the property.

DEER LODGE COUNTY.

At Ophir the Avon M. Co., in the Ophir mine, have sunk 200 feet and have cross-cut the south drift 120 feet in ore, showing fine black sulphides and coarse ore which carries copper.

A contract has been let on the Snow-shoe to sink a shaft.

GRANITE COUNTY.

Healey & Sweeney have good ore in the Luxembourg mine, on the Georgetown flats.

Near Phillipsburg the Howard Copper Co. has ore carrying gold, silver, lead and copper.

JEFFERSON COUNTY.

W. A. Gallagher is taking good ore from his property, southeast of Jefferson City. The product goes to the East Helena smelter.

Longmaid Bros. will put a 100 H. P. bolting engine in place on the Elkhorn mine and 2300 feet wire cable.

Near Basin, C. J. Davis of the Buckeye concentrator will put the works in shape for a run on ore from the Buckeye. The mill is to be operated in connection with the concentrator.

E. W. Beattie proposes to the individual stockholders in the Basin & Bay State M. Co. to buy their holdings in the property, 22 miles from Butte. He offers to pay for the bonds at the rate of 83% flat, and give the stockholders \$3 per share for the stock, these payments to be conditional that he shall have 7500 shares of the stock and \$225,000 worth of the bonds.

Elkhorn reports strike of silver ore in the Elkhorn mine at the 450-foot level, of a stringer 8 inches wide, ore assaying 500 ounces to the ton. The stringer is being followed towards the foot wall, where it may widen out into one of the big chambers from which the Elkhorn took several hundred thousand ounces of silver.

Men are at work on the Baltimore claim, near Boulder.

LEWIS AND CLARKE COUNTY.

Near Helena, the Last Chance channel is found by P. R. Martin.

MADISON COUNTY.

Near Sheridan the Toledo properties have been sold to Eastern men, who will push work upon them. L. D. McCall of Chicago, president of the Bismarck and Nugget Gulch Con. M. Co., has closed the deal for \$40,000 spot cash. Mr. Ring will have charge of the mining operations at the Nugget gulch and Brandon mines; A. B. Knight will superintend the mill and smelter; F. B. Linderman is assayer for the company. The concentrator and furnace will be remodeled. Mr. McCall says his company is prepared to expend \$100,000 in development work.

The present terminus of the Northern Pacific road is at Alder. Two dredgers are in operation within 300 yards of the depot, one owned by the Chicago M. & Dev. Co., which is working a portion of the mining ground under lease from the Conroy Placer M. Co., which owns the ground and a large part of Alder gulch below Virginia City. The ground yields 20 cents per yard, and the dredger, which is an old one, is working 2½ yards a minute, working twenty-four hours. The company is building a dredger that will handle three times as much. The Madisonian says "the intention of the company in dredging the ground is to extract the gold and to replace the earth in such a manner that it may afterwards be used for farming purposes."

The Toledo mine, 3 miles from Sheridan, may be worked this summer.

The Copper Chief M. Co. reports a strike of a ledge of native copper 30 miles from Butte. The strike was the result of a crosscut at the 140-foot level. Assays show the ore will run 10% copper.

PARK COUNTY.

Work on the property owned by the Scotch Bonnet M. Co., Cooke City, will be resumed July 15, but no shipments will be made until next year, by which time it is expected that Cooke will have a railroad. In case the road is not built, however, the ore will be hauled by wagon to Gardiner, on the edge of the Yellowstone park, and shipped by rail to smelters. It will cost \$10 per ton to get the ore to the railroad. The product has a stated value of \$30 to \$40 per ton gold.

RAVALLI COUNTY.

At Hughes creek miners are making good clean-ups from placer ground. The Crandall Creek Placer Co. cleaned up about \$2300. Near the placer diggings are some copper claims, owned by Castner & Shannon, which are being developed.

SILVERBOW COUNTY.

M. Finlen says that on Jan. 26, 1901, he sold all his interest in the Minnie Healey property to the Boston & Montana M. Co. for \$139,500.

The Pacific mine, the first producing property in the new copper district east of Butte, is reported sold to the Butte Mine Exploration Co. for \$40,000.

NEVADA.

CHURCHILL COUNTY.

A company is organized to work borax and has 1000 acres in the marsh at the mouth of Cottonwood canyon.

ELKO COUNTY.

W. D. Higginbotham, manager White Rock Co., Elko, reports the first regular clean-up satisfactory.

ESMERALDA COUNTY.

J. N. Gardner of the Esmeralda Con. M. Co. will start the work on the company's mines near Hawthorne.

The second payment of \$10,000 has been made on the Pamlico-Lapanta group, Hawthorne district. J. A. Yerington is expected to resume work on the mine.

HUMBOLDT COUNTY.

Near Lovelock the Kennedy mill has started up on ores from the Imperial mine.

LINCOLN COUNTY.

J. Boyle is general manager Lenore M. Co., near Hardyville. He has an 8-stamp mill, thirty-ton capacity, and will blow the whistle the first time July 4th. The mill is of the 2-stamp battery variety, each stamp weighing 1000 pounds. It is on the Colorado river at Hardyville, 8 miles distant from the mine.

The manager of the Keystone mill at Sandy contemplates a much larger plant. In the Keystone mine the force of miners has been doubled in the past month.

E. F. Freudenthal, Supt. Manhattan M. Co., Pioche, reports a strike on the porphyry dike, which joins the Alps mine. Samples of ore average 2000 ounces in silver and \$12 in gold. The vein is 4 feet wide, lying between the porphyry and the quartzite.

NYE COUNTY.

C. D. Van Duzer has gone to organize a company to operate a group of claims in Tonopah.

The president of the Investors' Co. of San Francisco says, regarding the ores of Tonopah, that they have developed a process adapted to those ores, and are prepared to put up a \$65,000 plant if assured ore with which to maintain it. They have contracted with the lessees on the Tonopah Co.'s ledges to treat ores, but the company insists upon its right to designate by whom the output of the leases shall be treated. Accompanying the proposition is a schedule upon which the ores will be purchased on the ground.

Dick Patterson, the discoverer of the Lone Mountain mines, 20 miles south of Tonopah, says the property has been sold for \$160,000—\$10,000 down, \$50,000 to be paid in ninety days and the remainder on a specified date. Dick's share in the sale will be \$20,000 and 20,000 shares of stock in the new company. He received \$3000 of the first payment, the remainder of the \$10,000 going to the locator of the mine, Jack Darrrough, of Smoky valley. Dick Patterson is a Shoshone Indian, who says that he is going to travel and see the world on his money.

The Bonanza directs attention to the fact that a source of electric power lies within 100 miles of Tonopah by a route unimpeded for transmission wires; the rapids of the Owens river, Bishop, Inyo county, Cal., a volume of swiftly flowing water, could be utilized in a plant to develop 10,000 H. P., which in Tonopah would solve the problem of cheap light and power for pumping, hoisting, crushing and other industrial demands.

The Tonopah M. Co. has bought the Columbus coal mines, 40 miles from Tonopah. The coal is lignite, runs high in ash, but has heating properties.

J. A. Yerington has organized a company to take water 65 miles from Twin river into Tonopah, at an expense of \$300,000.

STOREY COUNTY.

At Virginia on the 1600 level of the Union shaft the joint Sierra Nevada and Union Con. crosscut from the main west drift is in 133 feet, with the face in porphyry. The Union Con. Co. has started west crosscut 3 from the south drift on this level at a point 500 feet south of the north line of the mine and advanced the same 14 feet in soft porphyry and clay.

In the Gould & Curry mine the north-westerly drift on the 425 level has been

advanced a total distance of 182 feet from the main west drift. The face is in soft porphyry.

In the Utah Con. mine the south drift started in surface tunnel No. 2 at a point 797 feet in is still in porphyry and quartz, the latter showing some value.

WASHOE COUNTY.

J. Sheehan, owner Crown Point mine, Olinghouse gulch, has finished milling ten tons that yielded a brick worth \$725.

Last week John Sparks of Reno gave G. S. Wedekind a check for \$150,000 in payment for the latter's mine in the district of that name north of Reno.

WHITE PINE COUNTY.

Cherry Creek reports new strikes and a new camp, Cucamongo, 4 miles south of Egan canyon. Manager W. H. Brown of the North Mountain M. Co. will prospect its vein from a new opening. The management of the Glasgow & Western is blocking out ore.

NEW MEXICO.

GRANT COUNTY.

The Aberdeen Copper Co. at Lordsburg is sinking shafts on its mining properties in the Lordsburg district.

The Granite Lead mine at Stein's Pass has been sold for \$30,000 to New York men.

SANTA FE COUNTY.

The McKinley G. M. Co. is milling ore at the Mayo mill, Golden.

The smelter at Cerrillos is receiving ore from all sections of the Territory.

The Calaveras M. Co. has shipped a carload of copper ore from Alamogordo to the smelter at El Paso. This ore is from the Caballero canyon.

SIERRA COUNTY.

Fairview reports activity in mining in the Chloride and the Hermosa mining districts; wages \$3 per day and a scarcity of men. C. T. Brown of Socorro, secretary of the School of Mines, has been in Fairview examining work being done on the property of the Mines Development Association, of which he is general manager.

OREGON.

BAKER COUNTY.

At Sumpter the North Pole will put in twenty stamps in addition to the present twenty stamps, and a small cyanide plant. Another strike is reported in the Red Boy mine.

The Imperial mine of Cable Cove is shipping high-grade ore.

J. N. Esselstyn, manager the Mountain View, is expecting to strike the vein soon.

The North Pole mine will add twenty stamps to its mill.

At the Phoenix mine, Manager C. Parker will have his own mill of twenty stamps next month and will then double the output.

At the Badger mine, Susanville district, the Badger Co. is erecting a 100-ton concentrating plant and employs about the mine and mill fifty men. The concentrator will be operating this month.

GRANT COUNTY.

Supt. E. P. Kennedy will have a 75-ton concentrator on the Badger mine at Susanville by Aug. 1, when work will be started on several thousand tons of ore on the dump. Thirty men are employed.

The Stockton at Susanville is down 250 feet and is working ten men.

JOSEPHINE COUNTY.

Near Grants Pass the Champion M. Co., Williams district, will put in a five-ton air compressor and other machinery and improvements at the Rising Star mine. The company will run a tunnel in the mountain 3000 feet to tap the famous Tip-Top ledge.

LANE COUNTY.

Near Cottage Grove the 10-stamp mill of the Helena has started up.

MALHEUR COUNTY.

O. E. Head says near Dell he has found several pockets of zinc ore.

SOUTH DAKOTA.

HUGHES COUNTY.

At Butte, Mont., articles of incorporation of the Montana Smelting & Refining Co. have been filed. Capital stock, \$3,000,000; principal place of business, Pierre; trustees, M. Stageman, New York City, G. W. Sanders, Pierre, S. D., J. Johnson, Butte, Mont.

LAWRENCE COUNTY.

Deadwood wants the meeting of the International Mining Congress next year.

At the Spearfish cyanide property, Johnson gulch, near Deadwood, seventy men are employed in the mine and mill. One hundred and twenty-five tons of ore are treated in ten hours. J. Bunk is foreman.

At Cyanide the Spearfish M. Co. and the Deadwood Standard are operating their cyanide works at full capacity with high extraction of gold.

The Dakota M. & M. Co. of Deadwood

will increase the capacity of the cyanide plant in Deadwood from 100 tons per day to 200 tons.

A recent discovery of a vein of silver ore by C. Brown at Carbonate is reported. It is of white quartz, intermingled with iron and graphite, and carrying silver in the form of a black sulphide. Samples gave returns of 100 to 400 ounces. The formation is slate, porphyry cap; veins of graphite and plumbago exposed.

PENNINGTON COUNTY.

At Hill City Manager Daily of the Aberdeen G. M. Co. has a good ledge, and will sink further.—The Gopher M. Co., under the management of T. J. Arundel, is developing the property.—E. C. Johnson has completed the machinery on his tin property and development continues.

Work has been stopped in the main shaft of the Columbia M. & M. Co. at Rochford by the inflow of water. The company will put in a steam hoist, pump, air compressor and machine drills.

PERRY COUNTY.

The Bee Lode M. & M. Co. will extend its operations in the vicinity of Perry, the shaft to be put down another 80 feet. The Bee Lode Co. owns ten claims, joining property of the Clover Leaf M. Co.

UTAH.

Utah smelters report scarcity of men and say that they could give present employment to 200 more men.

During 1901 the value of the gold, silver, lead and copper produced was \$27,091,709, divided as follows: Gold, fine ounces, 184,803; silver, fine ounces, 11,319,860; copper, fine pounds, 26,931,888; lead, fine pounds, 99,102,516.

BEAVER COUNTY.

At Milford, Supt. Holdaway is in charge of the Klondike claims of the Klondike C. M. Co.

C. D. Rollins, foreman Copper Ranch mine at Jewel Mound, has a 12-foot body of ore that carries 60% iron and values in copper.

The Revenue M. Co. will put a concentrator on its property in Pine Grove district. The mill product will be hauled to the railroad at Frisco.

Material for the Majestic Co.'s smelter at Milford will be ready to forward this month.

IRON COUNTY.

The Ophir of Stateline on March 1 placed a mortgage for \$100,000 to secure the payment of 200 bonds of \$500 each, drawing interest at the rate of 5%.

JUAB COUNTY.

J. H. McChrystal, superintendent Godiva mine, Eureka, says that the property closed down July 1st for an indefinite period. The cause assigned, according to the Tintic Miner, is the disinclination of the management to accede to the demands of the A. S. & E. Co. "We have in the Godiva 150,000 tons fluxing ore that carries 10% to 12% lead, fifteen ounces silver and \$1 in gold, but have been unable to find a profitable market for it." The Tetro, which has been getting ore from the Godiva to operate its hoisting and drilling machinery, will be obliged to seek it from another source or install a plant of its own.

SALT LAKE COUNTY.

Manager M. C. Fox of the Storey group at Bingham is putting in increased mechanical facilities.

Supt. R. W. Rogers is pushing the air shaft on the Bingham Con.'s Dalton & Lark group of mines at Bingham. It is 4x7 feet in the clear. From its portal the main tunnel has advanced 3300 feet, 1200 feet from the station established at the bottom of the airshaft.

The Bingham Con. smelter, Bingham Junction, is to have a steel stack weighing 110,000 pounds, 230 feet high and 12-foot base; diameter, 8 feet at top.

The air compressor for sixty drills at the properties of the U. S. M. Co. at Bingham is in place. The bins at the Rio Grande terminal are finished for delivery of 1000 tons daily.

SUMMIT COUNTY.

Manager M. Sommer, the Park gold King, Park City, has fifteen claims adjoining the Midnight Sun and Silver Bell, and will put down a shaft.

The capacity of the concentrator of the Daly-Judge M. Co. at Park City is to be tripled and twenty-four new concentrators will be put in. Two hundred are on the payroll.

Mgr. T. Roscamp has resumed work on the Cornucopia mine, near Park City.

At Park City the Record reports Manager J. J. Daly of the Anchor mine about to open up the Bonanza Flat properties through the lower levels of the Anchor. Drifts from 700, 1200 and 1400 levels of the Anchor are being pushed toward the Daly-Judge ground; the main drift is now in over 2000 feet. The company has de-

vised to treble the present capacity of their mill, making it capable of treating 300 tons daily. In addition to the enlarged mill within a year a zinc mill, to be located just below the present mill site, will be built to handle the tailings and middlings. The output is netting the company \$30,000 per month.

TOOELE COUNTY.

The mercury deposits that first gave the camp of Mercur its name are showing up again bigger than ever in the Sacramento mine workings. Manager Glen R. Bothwell says the mercurial ores had been followed by Supt. Cochler 35 feet; the width was 8 feet, although no crosscut has yet been run. The ore appears on top, sides and bottom and is exposed in the face of drift, and under the scratch of a knife blade or pick becomes as red as vermilion. Samples show a valuation of \$408 per ton in quicksilver and gold. The management, before ordering the construction of a retort with which to reduce the quicksilver to commercial form, will experiment a little.

Mercur will be rebuilt and in better shape than before the fire.

At Stockton, the management of the Honerine has bought 960 acres extending from Terminus, for \$8500. The ground gives chance for the long tunnel through which the ore bearing zone at Stockton is to be drained.

WASHINGTON.

Work on the topographic survey of the State of Washington was recently resumed by the U. S. Geological Survey. A party was organized at Spokane July 1 by G. T. Hawkins to extend existing triangulation in the vicinity of Spokane southward to cover the territory between latitude 46° 00'—47° 30' and longitude 117° 00'—117° 30'. This triangulation is preliminary to the detailed mapping of the above territory, which includes portions of Whitman, Asotin and Garfield counties, this State, and Latah and Nez Perce counties, Idaho. Included within the area are the towns of Colfax and Asotin, this State, and Moscow and Lewiston in Idaho. It is expected that the triangulation will soon be followed by the topographic mapping, the results of which, when completed, will be issued in the form of three map sheets, each representing a quadrangle, or 30' of latitude and 30' of longitude.

Topographic map sheets of parts of this State already issued by the U. S. Geological Survey are Tacoma, Seattle, Mt. Stuart, Glacier Peak, Stillaguamish, Ellensburg and Spokane and a small portion of Clarke county. These maps are now available at 5 cents a copy. Orders should be addressed to the director of the U. S. Geological Survey, Washington, D. C.

WYOMING.

CARBON COUNTY.

Denver reports \$20,000,000 is represented in a consolidation effected in Wyoming, the new organization to be known as the North American C. Co. Among the directors are Joseph Seep, vice-president Standard Oil Co.; John S. Cary, president Mine & Smelter S. Co.; P. Collins, Tidewater P. L. Co.; W. G. Emerson and C. E. Knapp, general manager Boston-Wyoming smelter at Grand Encampment, Wyo. The properties to be merged are the Boston-Wyoming Smelter Co., Southern Encampment Townsite Co.; Frambush Waterworks Co., Emerson Electric Co., and the Ferris-Haggerty Copper M. Co. It is said there are several mining properties that will furnish as much ore to the smelter as will the Ferris-Haggerty. The new corporation has let a contract to the Mine & Smelter S. Co. of Denver for enlarging the present smelter plant from a 100-ton to a 500-ton daily capacity, installment of a concentrator capable of handling 500 tons of ore daily, and a converter to manufacture copper matte into blister copper.

Encampment reports that the Ferris-Haggerty C. M. Co. refused the merger proposition on a basis of \$500,000 in cash and \$500,000 in consolidated stock.

Near Battle Lake, T. J. McCarthy has sold 65% of the Big Chief property for \$25,000.

FOREIGN.

BRITISH COLUMBIA.

The Granby smelter has been offered a contract to treat 650 tons of Australian matte monthly.

At Ymir, Manager Popkiss of the Ymir G. Mines, Ltd., and E. C. Hooper of the engineering firm of Beowick, Moring & Co., are making investigation of the Ymir mine. A full complement of eighty stamps will be run again; pay ore has been reached in the drift at the 1000-foot level.

The Bosun mine, of the Slocan, has shipped to Antwerp, Belgium, for smelting, a carload of zinc ore.

N. S. Clarke, manager Eureka mining properties, Quatsino Sound, has men surveying for the aerial tramway from the

beach to the mines—4300 feet; the work will soon be started. On the completion of this work an air compressor will be installed. There is 10,000 H. P. available.

Rossland reports success in the treatment of the Le Roi's low-grade ore by the Elmore oil concentration process. Five tons were sent to the Elmore Co.'s works at London to be experimented upon. The ore carried about 1% copper and the reports show that it was concentrated 12 into 1 into an ore carrying 6% copper. The process consists in crushing the ores by stamp mill to 30-mesh size. The crushed ore is mixed thoroughly with petroleum refuse. The copper sulphides in the ore are taken up by the oil. Water is introduced and the oil carrying the copper sulphides rises to the surface. The scum thus formed is skimmed away and the oil is separated mechanically from the copper sulphides. About a gallon of oil to the ton of crude ore is lost in the treatment—not completely lost, for it remains in the concentrates and serves as fuel in the furnace when the concentrates are smelted. It is conceded that the cost of concentrating the ore will not exceed 75 cents a ton, aside from the royalty. The great gain is in the cost of smelting, as only one ton of concentrates would need be smelted, instead of twelve tons of crude ore.

In the Lardeau district the Gold Finch free-gold property at Goldfields is sold to the Northwest Dev. Syndicate for \$25,000. The new owners will put in a stamp mill in connection with their electric plant.

From Rossland the Columbia-Kootenay mine is making test shipments to the Trail smelter.

At Fairview, C. Ostenburg, manager Stemwinder mine, has the results of two mill runs—one of 200 tons from the main vein, which returned values of \$3.10 per ton in bullion and \$2.16 in concentrates; average loss in tailings 90 cents per ton. The second run, on 350 tons from the main vein and 150 tons from the north vein, gave a return of bullion \$1.21 per ton and concentrates \$2.06—the average loss in tailings \$1.16 per ton. The cost of mining the ore and delivering it at the mill is \$1.75 per ton. He has overcome a difficulty previously experienced in cyaniding the concentrates by a contrivance of his separating the galena from the pyrites and admitting of the latter being treated on the spot, the galena concentrates being shipped. The stamp mill is now running forty stamps and milling 100 tons of ore daily. Twenty stamps will be added from the Smuggler mill. Mining is in progress at three levels; thirty men are on the payroll.

F. W. C. Whyte, general manager Trail Creek coal mines, recently bought by the Amalgamated Copper M. Co., has begun active development on the property. Railroad spurs are being built and a town is springing up.

H. L. Frank of Butte, Mont., denies the recent report that he sold his interest in the coal mines at Frank, Crow's Nest Pass district.

A consignment of pig lead was made to Winnipeg on June 28th by the Trail smelter, the first pig lead produced on a commercial scale by electricity. Plans are being prepared for a plant which will turn out fifty tons of pig lead daily.

W. W. Warner, Supt. Wonderful group, Sandon, says there is a strike there, distinct from the other levels, and 200 feet farther west, a mixture of galena and carbonates.

The report of Manager J. MacKenzie on the condition of the Le Roi at Rossland for April is reported in part as follows: "The gross value of the ore shipped from the mine was \$262,320, equal to a value per ton of \$10.24. From this deduct difference between gross value and refiners' settlement rates and interest on gold and silver values for ninety days and copper sixty days, or \$1.74, which gives a net value per ton of ore of \$8.50. The net value of 255,931 tons of ore was \$217,544. From this deduct total cost of mining, or \$80,827, which gives \$136,717. From this deduct cost of smelting, freight and treatment at \$4.63 per ton, or \$118,498, which gives a total net profit for the month of \$18,219."

The British Columbia Coal Co. will put in a diamond drill plant on its coal properties, comprising 11,000 acres on the north fork of Kettle river, 60 miles north of Grand Forks.

MEXICO.

SONORA.

The Gran Provedora de Cobre M. Co. is about to begin work on its copper properties near La Calera, Altar district; W. E. Hefty of Phoenix, Ariz., is manager.

At the Cananea camp, Sonora, there are seven hot blast furnaces, total capacity 2500 tons ore per day. A company has been formed to extend the Cananea Railroad a distance of 600 miles to Topolobampo.

The projected smelting plant to be built at Guaymas is locally credited with an in-

tended daily capacity of 1000 tons of ore. L. Cloud is general manager Transvaal Copper M. Co. The property is 35 miles west of Cumpas.

SOUTH AFRICA.

At Pretoria, June 9, a proclamation was issued repealing the measure passed by the late Transvaal Volksraad which imposed a tax of 5% on the net profits of mines, and in place thereof imposing a tax of 10% on the net produce obtained from the working of claims, mynpatches and other gold-bearing grounds in the colony. Such net produce is to be taken as the value of the gold produced after deduction of the cost of production and of the sums allowed for the exhaustion of capital, as provided in the proclamation. It is expected that the new duty, which is, like the old one, a percentage on output, not profits, and therefore much smaller than it seems, is accompanied by the break-up of the dynamite monopoly and other contrivances. The added duty on mine products will be compensated by remissions of taxation elsewhere, and by honest administration generally.

May returns, as furnished the London Mining Journal, show considerable progress in the Transvaal, as shown in some detail, as follows:

Angelo Gold: May crushing, 7141 tons crushed, recovered 2059 ounces; 5674 tons treated by cyanide, recovered 1861 ounces; total ounces, 3920.

Bonanza: May results: Mill—Crushed 8107 tons, obtained 4821 ounces. Cyanide and slimes works—Treated 8107 tons, yielding 2369 ounces; total, 7190 ounces of fine gold; profit, £20,000.

City and Suburban Gold: Crushing for May, 5164 ounces; profit, £10,755.

Crown Deep: May results: Sixty-five stamps, working 29 days 8 hours, crushed 9684 tons; yield, 2487 ounces; 6560 tons of sands and concentrates treated by cyanide works; yield, 1628 ounces; 2664 tons of slimes treated; yield, 142 ounces; total yield, 4258 ounces fine gold; estimated profit, £6400.

Crown Reef Gold: May results: Mill, 4649 ounces; cyanide works, 2378 ounces; slimes works, 268 ounces; total, 7295 ounces; working expenditure and revenue, 11,637 tons milled; to mining, transport, milling, cyanide, treatment of slimes, general charges, maintenance and mine development, £14,757; profit, £16,230; by gold account, 4649 ounces from mill (£19,748), 2378 ounces from cyanide works (£10,099), 268 ounces from slimes works (£1140); total, £30,987; revenue per ton crushed, £21.33 3.07d; cost per ton crushed, £15s 4.34d; profit per ton crushed, £17s 10.73d.

Driefontein Con.: May crushing: Sixty stamps crushed 8254 tons; recovered, 2063 ounces; treated by cyanide, 6730 tons; recovered, 2380 ounces; total, 4443 ounces.

Durban-Roodepoort Gold: June 6—May results: Quartz milled, 6230 tons; fifty stamps, 27 days, 3281 ounces; tailings treated, 4311 tons; fifty stamps, 27 days, 1084 ounces; total, 4365 ounces.

Ferreira Deep: May: Fifty stamps, working 29 days 11 hours, crushed 8248 tons; yield, 2858 ounces; treated by cyanide works, 4800 tons of sands and concentrates; yield, 1622 ounces; slimes treated, 2128 tons; yield, 156 ounces; total yield, 4637 ounces fine gold; estimated profit, £12,000.

Goldenhuis Deep: May: One hundred and thirty stamps, working 30 days 11 hours, crushed 17,600 tons; yield, 4825 ounces; treated by cyanide works, 14,238 tons of sands and concentrates; yield, 2674 ounces; slimes treated, 3454 tons; yield, 292 ounces; total yield, 7792 ounces fine gold; estimated profit, £16,300.

Goldenhuis Estate: May: Crushed (sixty stamps) 9594 tons; obtained from mill, 2827 ounces; obtained from tailings by cyanide, 1696 ounces; obtained from slimes, 475 ounces; total, 4998 ounces of fine gold; profit, £11,360.

Glen Deep: May: Forty stamps, working 30 days 20 hours, crushed 7100 tons, yielding 1226 ounces; treated by cyanide works, 5680 tons of sands and concentrates; yield, 832 ounces; 2000 tons of slimes treated yielded 175 ounces; total yield, 2234 ounces fine gold; estimated profit, £2200.

Henry Nourse Gold: May: 3716 ounces; profit, £5306.

Jumpers Deep: May: Sixty stamps, working 30 days 1 hour, crushed 9993 tons; yield, 2183 ounces; treated by cyanide works, 6800 tons of sands and concentrates; yield, 1163 ounces; slimes treated, 3087 tons; yield, 167 ounces; total yield, 3504 ounces fine gold; estimated profit, £2600.

Lancaster West Gold: May: Forty stamps, running 29 days, crushed 6806 tons, yielding 1874 ounces fine gold. From cyanide works 4839 tons were treated, yielding 719 ounces fine gold; estimated profit, £3416.

Langlaagte Deep: May: Seventy stamps, working 31 days 4 hours, crushed 11,396 tons; yield, 2882 ounces; treated by cyanide works, 9054 tons of sands and con-

centrates; yield, 1378 ounces; slimes treated, 2380 tons; yield, 96 ounces; total yield, 4357 ounces fine gold; estimated profit, £5400.

May Con. Gold: May: Fifty stamps, running 30 days, crushed 7650 tons, yielding 2627 ounces. From cyanide works, 5160 tons were treated, yielding 1220 ounces. From slimes works 1710 tons were treated, yielding 206 ounces. Total, 4053 ounces fine gold; estimated profit, £7337.

New Comet Gold: May: Fifty stamps crushed 5554 tons, recovered 1171 ounces; 4170 tons treated by cyanide, recovered 803 ounces; total, 1974 ounces.

New Goch Gold: May: Forty stamps running out of sixty, as follows: 1418 ounces from 6035 tons of ore crushed, 681 ounces from cyanide, 733 ounces from concentrates, 38 ounces from by-products; total, 2870 ounces of fine gold; profit, £2623.

New Primrose Gold: May, 4187 ounces; profit, £6000; eighty stamps, 27 days.

Nourse Deep: May: Fifty-five stamps, working 29 days 5 hours, crushed 7777 tons; yield, 1181 ounces; 6263 tons of sands and concentrates treated by cyanide works yielded 827 ounces; 2100 tons of slimes treated yielded 102 ounces; total, 2111 ounces fine gold; estimated profit, £400.

Riefontein "A": May: 2608 ounces; profit, £3850; thirty stamps, 28 days.

Robinson Deep: May: Crushed 7964 tons, yielding 4015 ounces.

Robinson Gold: May: Sixty stamps crushed 7912 tons, yielding 5239 ounces; tailings by cyanide, 1528 ounces; own concentrates (by chlorination), 750 ounces; total, 7517 ounces of fine gold; net profit, £20,000.

Rodepoort United Main Reef Gold: Twenty-five stamps running out of seventy for 144 days during May; 691 ounces of fine gold have been obtained from 3000 tons of ore crushed; no clean-up was made from the cyanide works during the period stated.

Rose Deep: May: Seventy-five stamps working 29 days crushed 11,700 tons, yielding 2845 ounces; 9600 tons of sands and concentrates treated by cyanide works, yielding 1892 ounces; 2386 tons of slimes treated, yielding 156 ounces; total yield, 4894 ounces fine gold; estimated profit, £8100.

Sheba Gold: June 9: Permission has been granted to resume work, supplies being sent forward slowly; mining labor is scarce; will commence as soon as possible.

Simmer and Jack Proprietary: Total amount of ore crushed since commencement of crushing to end of May, 13,069 tons, yielding 3410 ounces.

Treasury Gold: May: 3940 ounces from 7800 tons crushed; profit, £8650.

Village Main Reef Gold: May: Sixty-five stamps ran 29 days; total yield from all sources, approximately, 4897 ounces; estimated profit, £7200.

Globe and Phoenix Gold (Rhodesia): May: Twenty-five stamps ran 28 days, crushed 3910 tons of ore; duty per stamp per day, 5.55 tons, yielding 3128 ounces bullion, equal to 16 dwts. per ton. Tailings—Average assay value per ton, 2.54 dwts. fine gold. Cyanide—Tons treated, 2450, yielding 277 ounces bullion, equal to 1.35 dwts. fine gold, per ton. Total gold for month, 3405 ounces. Twenty-five stamps still running.

THE KLONDIKE.

On the 27th ult. the steamer Dolphin arrived at Seattle, Wash., from Skaguay, bringing twelve large boxes of gold dust valued at \$1,000,000, the largest shipment made this season, consigned to banks and the assay office. There were eighty passengers and but few individual holders of gold dust. Another consignment of \$1,000,000 is expected on the steamer St. Paul.

Late Dawson advices state that C. E. Carbanneau and A. C. Willis have gone to Paris to conclude the largest deal ever made in the Klondike—fifteen gold mining claims belonging to the company.

The Dolphin, from Skaguay, brought \$1,000,000, shipped by Dawson miners.

Commercial Paragraphs.

THE Cleveland Pneumatic Tool Co. have appointed the Compressed Air Machinery Co. of San Francisco, Cal., to represent them on the Pacific coast.

THE Allis-Chalmers Co., through its Pacific coast representative, Geo. E. Ames, has the contract for the new hoisting plant at the Kennedy mine, Amador county, Cal., where a depth of 4000 feet is projected.

THE Colorado Iron Works Co., Denver, Colo., report the following sales: One 10-stamp, 1000-pound wet crushing mill for the Eureka Exploration Co., Silverton, Colo.; one 60-stamp, 1000-pound cyanide plant, erected complete, ready for operations, for the Hidden Fortune G. M. Co., Lead City, S. D.; iron work for one Nesmith crude oil hot blast stove for the

Monde Nickel Co., Ontario, Canada; iron work for one reverberatory roasting furnace for the Metal Volatilization Co., Denver, Colo.; one silver-lead smelting plant, with blast furnace 36x90 inches, for Jose S. Diaz, Guadalajara, Mexico.

A STEAM RAILWAY 40 miles long, the Cincinnati, Georgetown & Portsmouth Ry., is shortly to be converted from steam to electric traction. The Tennis Railway Equipment Co., who has the contract, has recently purchased from the Westinghouse Electric & Mfg. Co. two 600 KW. A. C. generators, and a number of 300 KW. rotary converters for supplying current to the line.

THE Pneumatic Cyanide process is to be used in the Hidden Treasure mill, Deadwood, South Dakota, a 180-stamp mill to be erected in three sections of sixty stamps each; the mill will have a capacity of 500 tons per day; also in the 100-ton plant of the Tobacco G. M. Co., Lake City, Colorado, now being erected; and in the 100-ton mill of the Sanger G. M. & M. Co., Monte Vista, Colo. The Pneumatic Co. of Denver, Colo., is also figuring on one other 500-ton mill.

Personal.

T. R. GARNIER is Supt. Osceola mine, Allegheny, Cal.

F. C. EASTON is Supt. Tabor mine, Gibsonville, Cal.

J. V. LANE is Supt. Mountain View G. M. Co., Fay, Nev.

L. M. TEALE is Supt. Yo Tambien mine, Globe, Ariz.

F. S. CHILLSON is Supt. Contention mine, Sonora, Cal.

SAMUEL NEWHOUSE has returned from New York to Utah.

A. B. GREEN is foreman Smuggler mine, Dunton, Colo.

E. F. CONANT is Supt. Santa Rita mine, Cripple Creek, Colo.

GEO. LYNN is assistant Supt. Golden Era mine, Columbia, Cal.

O. H. BROWN is Supt. Spearfish cyanide mill near Deadwood, S. D.

LYTTLETON PRICE, SR., has gone to Thunder Mountain, Idaho.

J. S. SULLIVAN is manager Chihuahua M. Co., Chihuahua, Mexico.

W. L. WATTS has returned from San Francisco to Los Angeles, Cal.

C. E. WATSON has been appointed Supt. Belmont mine, Tonopah, Nev.

A. P. WALBRIDGE has returned from California to Phoenix, Arizona.

C. C. RUTHRAUFF is general manager Rosetta M. Co., Hailey, Idaho.

F. W. DUNN is now manager Quartette mine and mill, Searchlight, Nev.

C. C. SHAW has resigned as foreman Pittsburgh M. Co., Caribou, Idaho.

S. T. PETERSON is general manager of the Nevada Co. mines, Austin, Nev.

E. L. SHAFNER, president International Mining Congress, is in Butte, Mont.

C. E. KNOX is manager Mispah Extension Co.'s property, Tonopah, Nev.

J. E. PRICE of Denver is examining mining property at Fort Jones, Cal.

F. C. PEREU is manager Southern Nevada M. & M. Co., Searchlight, Nev.

W. G. NEBEKER has returned from Pocatello, Idaho, to Salt Lake, Utah.

R. H. TERHUNE is operating the Tomichi Valley Smelter, White Pine, Colo.

J. D. FRESH, general manager Verde Grande M. Co., is in Los Angeles, Cal.

E. C. LOFTUS, late Supt. of the App. Quartz, Cal., will locate in San Francisco.

ROBERT ANGUS has been appointed manager Great Britain mine, Kaslo, B. C.

F. H. COLLINS, assistant manager Republic Con. G. M. Co., is at Idaho Springs, Colo.

C. M. DULL has returned from Salvador, South America, to Salt Lake City, Utah.

CHARLES S. PALMER succeeds R. Chauvenet as president Golden, Colo., School of Mines.

R. M. COLLINS, manager Scandia mine, Central City, Colo., has returned from Denver.

DAVID T. DAY AND J. T. KEMP are investigating Wyoming mines in search of platinum.

RICHARD GUENTHER, Supt. Yankee Con., Tintic, has returned there from California.

A. F. JUDSON has returned to Los Angeles from an inspection of Julian, Cal., mines.

E. C. RUST has returned from San Francisco to the Rawhide mine, Tuolumne county, Cal.

J. A. CASHION is superintendent of construction on the Prescott & Eastern,

which is being extended from Mayer to Crown King, Arizona.

L. A. DUNHAM, manager Clifton Con. G. M. Co., Clifton, Ariz., has returned from Denver.

E. I. HOLLAND, superintendent Good Hope M. Co., Phillipsburg, Montana, is in San Francisco.

ROBT. FROST will resume superintendency of the Six Eagles mine, Loomis, Wash., July 20th.

GEO. W. CROWE of Tucson, Ariz., says he is going to build large reduction works at Guaymas, Mexico.

R. A. PEREZ, assayer and analytical chemist of Los Angeles, is at Elsinore, Riverside county, Cal.

S. W. TRAYLOR of the Colorado Iron Works Co. has returned from White Pine, Nev., to New York City.

G. K. FISCHER is superintending the construction United States Co.'s smelter, near Salt Lake City, Utah.

A. LAFAYE, who has been working the Midnight mine, Clifton, Arizona, has returned to Salt Lake City, Utah.

C. B. HILL, president Pacific Con. M. Co., Pyramid lake, Nev., has gone to New York, to return in September.

EUGENE RUG is superintending operations at Nugget Gulch M. Co., Nugget Gulch, Madison county, Mont.

W. B. McDONALD took charge of the American Smelting & Refining Co.'s interests in Leadville, Colo., July 1st.

A. H. ELFTMAN, managing director Miller M. Co., Brownsville, Yuba county, Cal., has gone to Silverton, Colo.

J. J. WYATT is manager Desert Queen G. Co., Prosperity Co. and Verde G. & C. Co., Quartzsite, Yuma county, Ariz.

E. H. BENJAMIN, secretary California Miners' Association, has returned to San Francisco from El Dorado county, Cal.

W. J. BLADE is now Supt. Cripple Creek & Idaho Springs M. Co.'s property, the French Flag mine, Idaho Springs, Colo.

PETER MORGENSEN, engineer Monterey plant American Smelting & Refining Co., has gone on a five months' trip to Europe.

W. P. KINNEY will tour Colorado, collecting specimens for that State's gold, silver, copper and lead exhibit at the St. Louis Exposition in '04.

A. R. WILFLEY has returned to Denver, Colo., from Washington, Ariz., where he has been starting up the new mill and smelter at the Pride of the West mine.

C. P. COLLINS of Bradford, Pa., is in Encampment, Wyo. He is interested in the North American Copper Co., which has just purchased the smelter at Encampment.

CAPT. JAMES OPIE has been appointed manager Calumet & Hecla mine, in Michigan, to succeed Capt. Thomas Hoatson, who resigned to take charge of northern Michigan property.

F. L. NASON, Supt. Silver Pick mine, Mt. Wilson, San Miguel county, Colo., has written a novel, "To the End of the Trail," replete with interest and local color, ending tragically.

Books Received.

"The Hydro-Metallurgy of Copper," octavo, 228 pages, illustrated, M. Eisler, published in London by Crosby, Lockwood & Co.; in New York by D. Van Nostrand Co.; price \$4.50. This is a new and valuable work, treating on wet extraction of copper ores. Much has recently appeared in the pages of this journal, and the above work ably supplements the technical articles that have been of such interest to so many readers. The chapters on "applicability of the hydro-metallurgical treatment of copper," "the production of copper from sulphates," "the production of copper chlorides by wet process," "the precipitation of copper," "the refining of cement copper," and "the manufacture of copper vitriol" are among the most interesting in this valuable book. It will be sent anywhere upon receipt of price.

Trade Treatises.

"Crushers and Pulverizers," Trent Engineering & Machinery Co., Salt Lake City, Utah, No. 8; 8 1/2 x 11 paper, fifty-two pages. Detailed illustrated description of crushing and pulverizing machinery, with data, sectional and profile views.

Recently Declared Mining Dividends.

Bunker Hill & Sullivan M. & C. Co., \$9000.....July 5

Latest Market Reports.

SAN FRANCISCO, July 3, 1902

METALS.

SILVER.—Per oz., Troy: London, 24 1/2 (standard ounce, 925 fine); New York, bar silver, 52 1/2; refined (1000 fine); San Francisco, 52 1/2; Mexican dollars, 44 1/2; San Francisco, 42 1/2; New York.

Laredo, Texas, reports large daily shipments of pure silver in bars through that place from New Jersey to the Mexican Government Mint, City of Mexico. The average weight of the bars is seventy-five pounds. These ore shipments will pay no entrance duty. The Mexican Government some time since granted the American Smelting & Refining Co. the right to import 5,000,000 ounces of silver bullion that had been exported from Mexico. This bullion will be coined free of charge in the Government mints, and, under the ruling rate of exchange, will permit of a profit.

The annual coinage statement issued by the Director of the Mint shows that during the fiscal year ended June 30, 1902, the total coinage executed at the mints of the United States was \$94,526,687, as follows: Gold, \$61,980,572; silver, \$30,116,369; minor coins, \$2,429,736.

The net debt of the United States on June 1, 1902, was \$982,468,572, after deducting all the cash in the treasury.

COPPER.—New York: Standard, \$11.25@11.50; Lake, 1 to 3 casks, \$12.00; carload lots, \$12.25; Electrolytic, 1 to 3 casks, \$11.75; carload lots, \$11.50; Casting, 1 to 3 casks, \$11.75; carload lots, \$11.00. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £52 1s spot, per ton.

LEAD.—New York, \$4.12 1/2; Salt Lake City, \$3.60; St. Louis, \$4.00; San Francisco \$4.50, carload lots, 4 1/2c 1000 to 4000 lbs.; pipe 5 1/2, sheet 6, bar 5 1/2; pig, \$4.75. London: £11 2s 6d per ton.

SPELTER.—New York, \$4.87; St. Louis, \$4.50; London, £18 12s 6d per ton; San Francisco, ton lots, 6 1/2c; 100-lb lots, 6 1/2c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8 1/2c; San Francisco, 100-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$28.25; San Francisco, ton lots, 31 1/2c; 1000 lbs., 31 1/2c; 500 lbs., 31 1/2c; 200 lbs., 32c; less, 32 1/2c; bar tin, 3 1/2c, 37 1/2c.

PLATINUM.—San Francisco, crude, \$17.50 3/4 oz.; New York, \$19.50 per Troy oz.

QUICKSILVER.—New York, \$48.00 large lots; London, £8 15s; San Francisco, local, \$46.00 3/4 flask of 7 1/2 lbs.; Denver, \$50.00. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER.—Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100-lb. lots, 16c.

NICKEL.—New York, 50@60c 3/4 lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$21.00; gray forge, \$20.50; San Francisco, har, 3c 3/4 lb., 3 1/2c in small quantities.

STEEL.—Bessemer hillels, Pittsburg, \$33 and \$34; open hearth hillels, \$35.00; San Francisco, bar, 7c to 12c per lb.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 27@28c 3/4 lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 66 1/2c 3/4 lb.; soda ash, \$1.90 3/4 100 lbs.; hyposulphite of soda, 23@30c 3/4 lb.; blue vitriol, 5 1/2@6 1/2c 3/4 lb.; borax, concentrated, 7@8c 3/4 lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, \$2.00@2.25; flour sulphur, French, 2 1/2@2 1/2c; California refined, 1 1/2@2c; nitric acid, in carboys, 80 3/4c 3/4 lb.; caustic soda, in drums, 3@4c 3/4 lb.; Cal. s. soda, bbls., \$1.25 @1.50 3/4 100 lbs.; sks., \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls., 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 73c; cs., 78c; raw, bbl., 71c; cs., 76c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 64c; cs., 70c; raw, bbl., 62c; cs., 67c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13 1/2c; Mineral Seal, iron bbls., 19c; wooden bbls., 22 1/2c; cs., 25c; Mineral Sperm, cs., 26 1/2c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 21 1/2c; 86° Gasoline, bulk, 20c; do., cs., 26 1/2c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14 1/2c; do., in cs., 21c; Lard Oil, No. 1 bbl., 60c; cs., 65c; Neatsfoot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 52 1/2@55c; cs., 57 1/2@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6 1/2c; 1 ton and less than 5 tons, per lb., 6 3/4c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7 1/2c; in 25 lb. tin pails, 1c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2 1/2c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6 1/2c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7 1/2c; less than 500 lbs., 7 1/2c.

ASSAY LITHARGE.—Per lb., 8 1/2c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c 3/4 lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, 3/4 lb., 60c.

MAGNESIUM.—Per lb., \$3.00.

MANGANESE.—(90% and over) 3/4 lb., \$1.25.

MERCURY.—Bichloride, 3/4 lb., 90c.

MOLYBDENUM.—25c 3/4 gramme; 1000 grammes=2 1/2 lbs.

PHOSPHORUS.—(American) 3/4 lb., 80c.

SILVER.—Chloride, 3/4 oz., 75c; nitrate, 55c.

SODIUM.—Metal, 3/4 lb., \$1.00.

URANIUM.—Oxide, 3/4 lb., \$3.50.

ZINC.—Metallic, chemically pure, 3/4 lb., 50c.

ZINC.—Dust, 3/4 lb., 10c.

ZINC.—Sulphate, 3/4 lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING JUNE 24, 1902.

703,037.—RAILROAD SWITCH—W. J. Bell, Los Angeles, Cal.
703,113.—BOTTLE STOPPER—H. A. Clark, S. F.
703,057.—INDICATOR—L. E. Graham, San Jose, Cal.
703,081.—THRESHER—C. W. Haines, Stockton, Cal.
703,343.—TRAIN ORDER BOX—L. G. Hogg, Los Angeles, Cal.
703,344.—MORTAR BED—J. M. Holloway, Santa Barbara, Cal.
703,931.—THRILL COUPLING—T. J. Huhbell, Los Angeles, Cal.
703,956.—SLICE BOX—F. M. Johnson, S. F.
703,280.—BICYCLE STAND—L. H. Knoche, San Jose, Cal.
703,132.—STELLAR COMPASS—R. T. Lawless, Alameda, Cal.
702,974.—LOG TURNER—W. L. Leland, Sisson, Cal.
703,147.—LETTER BOX—T. C. McLean, Seattle, Wash.
702,988.—CALENDAR—Florence M. Nace, S. F.
703,084.—ORE SEPARATOR—C. C. Pratt, Portland, Or.
703,337.—ROAD OILING MACHINE—T. F. White, Chino, Cal.
703,381.—WASHING MACHINE—J. Woerndt, Frances, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ORE CONCENTRATOR.—No. 702,541. June 17, 1902. L. Cohen and J. Gross, Sombrerete, Mexico. This invention is an improvement upon ore concentrating tables and comprises two endless traveling belts or surfaces, one within the other, the inner one serving as a support for the outer or concentrator belt, and flexible bed sections upon which these belts are carried, and by which they are given a double incline, with means for varying the inclination of the belts.

HAND ROCK DRILL.—No. 702,499. June 17, 1902. V. Y. Smith, Oakland, Cal. In this invention is shown a device for drilling rocks and the like, and a mechanism including an impelling spring by means of which the drill is retracted against the action of the spring, means are provided for releasing it and allowing the spring to act, means for turning the drill between each forward movement, a lever and connected mechanism by the alternating movement of which the drill is retracted and released for each forward stroke.

BOTTLE STOPPER ATTACHMENT.—No. 703,113. June 24, 1902. H. A. Clark, San Francisco, Cal., one-half assigned to J. E. Daly of same place. Good assessor relates to an attachment for bottle stoppers of that class in which a stopper has a link passing through a hole in the rigid portion of the stopper and the ends of the link connected with a lever fulcrumed to the bottle by a wire or clamp surrounding the bottle neck, so that when the loop of the lever is pressed down against the neck of the bottle it acts through the link to draw the stopper downward and force the soft or flexible portion tightly into the bottle neck to form a closure, and when the lever is lifted up and turned about its fulcrum it releases the link and the stopper and allows the latter to be removed.

SITUATIONS WANTED.

WANTED.—Position by a technical graduate. Am an experienced stamp and cyanide millman, good assayer and chemist. U. S. deputy mineral surveyor. Can handle any kind of a mill or mine. Address Technical, care of this office.

ASSAYER, familiar with cyanide practice, desires position as assayer, or in some capacity, in cyanide plant. Address X, care of Mining and Scientific Press.

PHYSICIAN AND SURGEON with three years' experience in both emergency and general hospitals, in addition to experience in mines and private practice, wishes position in a mine. Best of references. Address Box 125, care of this office.

PRACTICAL MILLMAN.—AMALGAMATOR, Oxide Mill and Assayer, wishes position. School of Mines graduate. Best references. Address R. B., care of Mining and Scientific Press.

CHEMIST AND ASSAYER, WITH TWENTY years' experience in mill and smelter work. Can handle any kind of a mill or mine. Address A. C., care of Mining and Scientific Press.

MINING ENGINEER, practical miner and mill man, assayer, etc., desires position of superintendent or assistant manager of a big property. Eleven years' experience. Best references. Now working in southern California. Address A. M. P., care of Mining and Scientific Press.

Cyanide and Stamp Mill Superintendent open for engagement after September 1st. Graduate. A thorough assayer and chemist; also accountant. Speaks Spanish. Will go anywhere. Specialty, construction; also successful treatment of low-grade and slimy ores. References "A. I." Address Practical, care of Mining and Scientific Press.

WANTED.—SITUATION AFTER MARCH 15, 1903, as Manager or Superintendent of mine. Have had five years' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work. Four years' experience as manager and superintendent. Treatment of low grade ores a specialty. Practical in every detail. State location of mine and salary. Best of references. Address X. Y. Z., this office.

A technically educated Mining Engineer, at present employed as superintendent of mines at one of the largest corporations in Mexico, desires a change of position to the United States about July 1st. Has had 18 years' successful experience as engineer and superintendent, never having made a failure; 36 years of age; strictly temperate; a skilled designer, geologist and metallurgist, and a practical miner, as well as a hard worker and thorough business man. References of the highest order, including present employers. Address Supt., care this office.

Treatment of Slimes.

At the Sunshine Mining Co.'s property, Sunshine, Utah, Manager Geo. Moore has a filter process in operation which is successfully solving the slime problem. The cyanide plant there is now treating 110 tons daily. In the filter process illustrated herewith the cyanide solution flows continuously through the 3-inch pipe, entering the separator at the right, while the ore is fed continuously through the open left end, as the separator revolves. As the ore passes down the incline shell of the separator it comes in contact with iron balls, which roll loosely in the machine, and by which action the sands are freed from the gold-bearing slimes, the latter being held in suspension and carried, with the solution, out of the open end at the left and discharged into agitation tanks, then into pressure tanks, from which they are forced by compressed air through the filter presses. In the meantime the gold-bearing sands are picked up by huckets at the lower end of the separator, lifted to the top of the machine and allowed to fall upon a cone-shaped apron, the small end of which projects through the opening at the end of the shell, thus causing the sands to be discharged from the apparatus and into the large sand-leaching tanks below. The principle of this separation is that owing to the fact that the circular opening at the large end

Filter Process, Sunshine, Utah.

Slime Separator, Sunshine, Utah.

of the device is of smaller diameter than that at the small end the slimes have a fall of 6 inches from the large to the small, and the sands having a fall in the opposite direction of 15%, due to the conical shape of the apparatus. The ores are brought up to this separator by an incline belt, which is fed automatically from the crushed ore bin.

In Kalgoorlie, Australia, at the Golden Horseshoe, Manager J. W. Sutherland also makes a commercial success of filter pressing, chiefly on oxidized ore. There are there nine filter presses in series of three. The hattery slimes, which pass through 150-mesh screen, after passing over spitzluten separators, are pumped direct into the presses, the clear water being returned to the hattery. When the presses are full, cyanide solutions are forced through the cakes at a high pressure, approximately 90 pounds per square inch, until all the available gold is extracted. It takes approximately ninety minutes to fill, ninety minutes to extract the gold, and the same time to empty the three presses, and the costs are approximately: Cyanide, 40 to 50 cents; air, 14 cents; discharging presses, 29 cents; dumping residues, 21 cents. The total cost, including repairs and renewals, assaying, zinc, and realizing hullion, etc., varies from \$1.80 to \$2.10 per ton on approximately 3500 tons per month. The Great Boulder mine at Kalgoorlie also has a number of filter presses, and has treated 9000 tons per month, total costs being about \$2.40 per ton, including repairs and renewals.

On the Kalgurli mine two filter presses are used. The slimes are driven into the presses with compressed air at a pressure of 40 pounds per square inch. The spent, or sump, cyanide solutions are then pumped through the cakes at a high pressure to wash the cakes, which are then dried by compressed air. The costs are: Filter pressing, including air, emptying and closing presses, repairs and renewals and dumping residues, etc., \$1.04 per ton; total cost from hydraulic separators to dump, including cyanide agitation and power, \$2.65 per ton.

It will be noted that in the last-mentioned Australian mine the filter pressing, without any grinding power, costs \$2.65 per ton, the average residues for the three months' data furnished herewith being 1.95 dwt. per ton. The total costs for treating the sands, including 13 cents per ton power, also air used for recirculating cyanide solutions, is \$1.08 per ton, the average residue for the three months reported being 2.43 dwts. gold per ton, or 48 cents worse than the filter press residues, while the filter pressing costs \$1.47 per ton more than the sands treatment. This shows in that case a balance of 99 cents per ton in favor of the sands treatment. It will thus be seen that in this mine, to recover the extra 48 cents' worth of gold left in the sand residues, would cost \$1.47, plus the cost of grinding.

QUESTIONS involving the legality and illegality of mining transactions constitute a large part of the queries weekly received, and while earnest effort is made to give correct answer, yet, obviously, where litigation is liable it were advisable to get competent legal advice thereon. The law is merely a collection of memoranda and precedent, and while this paper can correctly state exact fact in some departments of mining and metallurgy, the courts have so often reversed their own decisions that any information furnished inquirers is liable to revision from the same source that supplied the original dictum.

Amending the Mining Law.

In the issue of the 14th ult. was brief editorial notice of the new mining law amendment introduced in the U. S. Senate by Senator Kearns of the State of Utah.

From all over this west half of America come requests for editorial opinion, coupled with vigorous argument for and against the measure.

This paper heartily favors Senator Kearns' amendment, and believes it would be better for the working miner than the present law. The author of the proposed amendment is himself a practical miner, has carried a tin dinnerpail and polished the head of a drill; by his efforts has attained a seat in the United States Senate, and has some clear ideas born of hard experience and long observation of this subject. He introduced the proposed amendment just before Congress adjourned, that metal miners everywhere might discuss it by the time Congress meets again. It is an important matter and merits full and free discussion. It is proper that every mining paper in the country should take up such proposed change in the Revised Statutes of the United States. It has been reported upon favorably by the United States Senate Committee on Mines and Mining, and will be either passed or defeated at the next session of Congress. Clearly, if miners show they want it, it will go through; if not, it will be turned down. The bill in full is as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled.

That Section 2322 of the Revised Statutes is hereby amended so as to read as follows:

SEC. 2322. Locators of mining locations hereafter made on any mineral vein, lode, ledge or mineral deposit situated on the public domain containing gold, silver, cinnabar, lead, tin, copper or other valuable deposits, their heirs or assigns, where no adverse claim exists at the passage of this Act, so long as they comply with the laws of the United States governing their possessory title, shall have the exclusive right of possession and enjoyment of all surface included in the lines of their location and of all veins, lodes, ledges and mineral deposits throughout their entire depth which lie within such surface lines extended downward vertically. Such location shall be in rectangular form and shall not exceed 1500 feet in length on either the end or side lines thereof; provided, that irregularly shaped claims may be located where previous locations render rectangular locations impracticable, but such claim shall not exceed in area a claim 1500 feet square. Every location hereafter made shall be distinctly marked on the ground, so that the same can be readily traced. Within 90 days from the date of location the locator shall cause the same to be surveyed and a plat thereof recorded in the office of the county recorder of the county in which the claim is situated. No person shall locate more than one claim in the same mining district. Provided, that he shall have the privilege of filing with the recorder of mining records in the district a notice of abandonment of a claim lo-

cated by him, and thereafter he shall have the right to locate another claim as fully as if no location had been made by him in said district. And the claim so abandoned shall be opened to relocation.

SEC. 2. That Section 2322 of the Revised Statutes, relating to tunnels, he and the same is hereby repealed.

SEC. 3. That all Acts and parts of Acts in conflict with the provisions of this Act are also repealed.

Section 1 cuts out all extralateral rights.

Section 2 cuts out tunnel and locator's rights to blind ledges discovered in a distance of 3000 feet from the mouth of his tunnel.

The miner is the only one to be considered. Whatever is best for him—that is the thing to do. If the present law, framed by Senator Wm. M. Stewart in 1872 (then and now United States Senator from Nevada), is satisfactory and right, retain it; if it works hardship and is irksome, or expensive, or demoralizing, repeal it, and pass Senator Kearns' amendment or something like it.

Other countries have tried the extralateral, apex law; they have all discarded it—except the United States and Bolivia. That, however, is no criterion. Every other mining country on earth (except Bolivia) may be mistaken, and to us, alone, of all the world, may be vouchsafed superior judgment. Still, it may be possible that the same degree of satisfaction and prosperity secured by the mining laws of other lands might be accorded the metal miners of this nation if the extralateral right were abrogated, and the simple surface right substituted.

Under the present system we have had thirty years of gigantic fraud, shameless blackmail, stupendous expense, and constant and cruel litigation. The mining industry of the country has prospered in spite of the country's mining law and not because of it. The extralateral law that Senator Kearns' amendment is designed to displace has cost more blood and treasure than all the foreign conflicts that this country has engaged in since 1876. Hence a change might be beneficial.

Effort to secure such change has been made ever since Senator Stewart's bill of 1872 became a law. Since 1879 frequent attempts have been made to pass some relief bill, but whenever such a measure got through the House of Representatives "Senatorial courtesy" strangled it in the Senate. Such effort, therefore, is not new; the subject is an old one.

In 1897 the representations on this subject made by this paper formed one of the potent factors in the formation of the Mining Congress which met in Denver and unanimously petitioned Congress for relief from the onerous burden entailed upon the mining industry by the infamous extralateral law. At each annual meeting of that body since, and at the annual meetings of such representative bodies as the California State Miners' Association, similar resolutions and petitions have been passed and sent to Congress praying for such relief. Doubtless at the coming meeting of the Mining Congress in Butte, Sept. 1, 1902, the resolutions of its predecessors at Denver, Salt Lake City, Milwaukee and Boise will be reiterated.

The matter long since passed beyond the domain of argument. Some change is made mandatory by the requirements of the situation. The past is so narrow; the horizon widens and the future grows broader and broader. It is intolerable that present conditions continue. As well try to compel a growing giant to wear the clothes of a ten-year-old.

Since 1872 this paper has patiently published hundreds of "decisions" on this extralateral feature, including several Supreme Court decisions, and nearly every time there is some new judicial interpretation. After thirty years of this kind of thing no one to-day can produce any decision of any court (not excepting the Supreme Court of the United States itself) that is not liable to be set aside, reversed or hacked down from. We have the authority of eminent law makers and officials—State and federal—for the assertion that the expense and loss occasioned by this extralateral right, now sought to be amended by Senator Kearns, is stupendous.

Section 2322, U. S. Revised Statutes, as interpreted and administered, has corrupted and debauched lawyers, judges, jurors and legislators, has sent thousands to suicides' graves, has wreaked ruin on thousands of others, and has deterred millions of

willing dollars from mining investment. In five years on the Comstock lode in Nevada the litigation compelled by this extralateral law cost in actual expenses, officially audited, \$9,000,000—one-fifth of the total product of Comstock mines engaged in the litigation, and vastly in excess of the amount of dividends those mines paid during that period.

There are things in this life, however, better than mere money; manhood and integrity can not be given commercial values; the "extralateral right" has cost more than tangible millions in the debauchery it has entailed.

To Senator Stewart's credit it must be said that even he realized the truth of this, and, seeing the dreadful mess in which his law had placed the mining situation, he proposed its repeal many years ago. Stalwart, sensitive and ever active in defense of his pet law as he was, yet on one occasion he proposed to end the Chollar-Potosi-Grass Valley litigation by defining the respective claims by surface boundaries. Our authority for this statement is Eliot Lord, Fourth Monograph, U. S. Geological Survey. "When the boundary lines were determined it was to be stipulated that planes should be drawn perpendicular to those lines, extending indefinitely downward, and that the mining operations of all companies should be confined within the limits of the planes bounding their respective claims. All pending suits should be adjusted as soon as possible, and, the main cause of litigation having been removed, he (Stewart) foresaw that the mining industry of the district would expand with natural vigor. Now, this was substantially a relinquishment of the cherished but litigious principle which allowed a locator to follow the dip of his ledge indefinitely."

The scheme was a sound one then, as now, but Senator Stewart abandoned it.

In 1878-9 Judge B. C. Whitman was the attorney of the great bonanza firm. In his testimony before the Government Land Commission (Oct. 11, 1879, page 421 of the report) he was asked his opinion of apex and surface locations. He said: "I think the square location would have no injurious effect upon deep mining. On the contrary, it would improve it. * * * A man could go in, then, feeling that he owned that piece of ground, and I think that every prospector would be willing to avail himself of that and go to work on that supposition. The history, so far as I know, of every mine and mining company is continued litigation and expense by adverse locations. With a square location there could be no litigation."

Seven years ago R. W. Raymond wrote: "The actual expense of litigations under this law has mounted into millions. The full development of the mineral resources of the West will never come to pass until the capital it requires is better protected by definiteness in title and boundaries of mining property. And that can not be done, in my judgment, by any amendment of the present law which shall leave in it the present abnormal, irregular, indefinable, precarious and mischievous extralateral right. * * * The system at present in vogue has fostered and will foster the most vexatious litigation."

Chief Justice Beatty says: "After a residence of seventeen years in the State of Nevada, with the best opportunities for observing, I can not recall a single instance in which the owners of really valuable mining ground have escaped expensive litigation, except by paying a heavy blackmail. * * * One man locates an honest claim in the evident apex of a true lode. Fifty or a hundred tramps locate claims all around him and over him. Not one of the tramps has discovered a lode; he has simply marked out a piece of ground and paid the recorder's fee. His claim is obviously valueless for working, but he is in a position to mine without the cost of muscle or plant. * * * The blackmailer's method is simple and effective * * * he has only to say, 'It will cost you less to pay than fight.'"

A public land commission specially organized for this whole matter and impartially made up some years ago got testimony from prospectors, mine owners, mining engineers, and mining men in general, secured expert evidence from practical miners in all this western country, and in their report to Congress said: "Your commission, after a review of the lines of mining contests and a consideration of the complex nature of ore deposits, are unanimous in the convict on that any attempt on the part of the

United States to convey such deposits as individual things beyond the vertical planes bounding the surface claim, must always end in a history of intolerable injustice. The result of our test of public opinion shows that, while there are regions whose simple fissure veins have not caused battles, and where, consequently, the people ask no change, the majority of experienced mining men desire a change from the lode location, with its disastrous sequel, back to the security and peace of the solid old common-law doctrine. The present law might be fitly entitled: "An Act to cause the Government to join, upon unknown terms, with an unknown second party, to convey to a third party an illusory title to an indefinite thing, and encourage the subsequent robbery thereof."

This is not cited as ancient history, but to show how hundreds of picked men who have given great thought and intelligent study to this thing, view the matter. Did space permit we could quote columns of caustic exhortation of the fraud that has so long been foisted on American miners. The thing is a horrible mess, and the more it is stirred up the worse it smells. Any one who will take the trouble to go into an investigation of this subject will probably come to the same conclusion. Thousands of our readers will doubtless recall some bitter bit of disastrous experience entailed by the existence of this law that Senator Kearns' amendment seeks to set aside.

There are always fifty little suits and one big one being tried involving this question. It is a profitable industry for mining lawyers and experts, but hard on the working miners who have to pay the millions of costs that this expensive foolery entails, and which would be stopped by the passage of a bill repealing the extralateral right. A case in point occurs as these words are being written in the present fight between the Bunker Hill & Sullivan and the Empire State-Idaho companies in an extralateral right case now on trial in the federal court. The suit is the result of the usual extralateral tangle, this time over the ownership of a silver-lead lode at Wardner, Idaho. It affects the ownership of claims along the whole length of the ledge. The local paper says, "It is so strangely involved that the ablest mining engineers in the country are puzzled over the facts, while the questions of law involved will probably take the case up to the Supreme Court of the United States."

This particular extralateral case hinges upon the peculiar manner in which the claim was staked nearly twenty years ago. The outcrop was so large that the prospectors were unable to discover the strike of the vein, but they staked a claim, the Bunker Hill, with its general course east and west. Subsequently it was found that the vein runs northwest and southeast, and its foot wall traverses the side lines diagonally. The ledge is from 200 to 1000 feet wide, and the course of its hanging wall is a problem that is at the root of the present litigation. The Bunker Hill Company claims that the hanging wall as well as the foot wall, passes through the two side lines, and thus the whole vein actually extends through the side lines instead of through the end lines as is usually the case. The Empire State-Idaho people concede that the foot wall passes through the side lines, but maintain that the hanging wall enters the claim on the south side line and leaves it through the west end line.

Under the decision of the United States Supreme Court in the Flagstaff case, a mining claim can be worked extralaterally within the planes of its side lines, extended, if the lode passes through the side lines, instead of through the end lines of the claim. The Bunker Hill Company asserts that such a condition exists in this case, and that therefore they have extralateral rights on the lode past the west end line, within the planes of the side lines, extended. The Empire State-Idaho Company claims that the hanging wall passes through the side line and an end line, and argue that the vein can not be properly said to traverse the claim through the side lines, and that the Flagstaff ruling does not apply. The Empire State-Idaho Company asserts that the Bunker Hill should take extralateral rights within the extension of its end lines, which would compel it to work southward instead of westward down into the ledge outside the limits of its surface. Then to make matters still more mixed up the Empire State-Idaho Com-

pany claims that the ledge instead of running approximately in an air line, really forms an arc, and that after passing out of the Bunker Hill ground northwestward, it travels in the segment of a circle until it comes into the Corrigan ground four miles from the Bunker Hill and due west of that claim, the lode forming a scoop underground. The extension of the Bunker Hill's extralateral rights through its west end line would then give it title to a part of the vein about 600 feet wide, extending down into the ground until it should turn upward again to form a new apex in the Corrigan ground. In the various claims on the segment of the circle between the Bunker Hill and the Corrigan there is room for unlimited litigation unless the ownership of the ore body in dispute shall be definitely settled.

Then comes the Last Chance claim, northwest of the Bunker Hill, and owned by the Empire State-Idaho. If the Bunker Hill should be the winner in the present litigation it will cut the Last Chance out of a large share of the ore body. If the Empire State-Idaho wins, the Last Chance will get much of the ore, and other portions of the vein will be left in further dispute as to ownership.

This is understated if anything. It forms a present example of how mine development is hampered and held back, for such costly performances deter capitalists and reduce dividends.

Bad roads, bad management, inexperience, the arrogance of ignorance, and other hindrances, hurt the mining industry, but all the drawbacks that could be enumerated, put together, are not as hurtful to the development of this west half of America as Section 2322, U. S. R. S., which is a relic of the silurian age, and has no place in twentieth century mining progress.

This paper is always willing to concede to other the same degree of consistency it claims for itself. Doubtless there are many who will honestly disagree with its belief, and will hold that the present law is all right and should not be disturbed. They have a right to be wrong if they want to, but the plain fact is that the extralateral law hinders mining development and bears the hardest on the working miner and on the men who put up money for mine development. And these are the very men that need protection, or at any rate, a fair show. No miner wants any favor; that isn't figured on anywhere by a real miner, but he does want and ought to have a free field for the successful exercise of his efforts, and a fighting chance to win.

Of course men who don't know that gold comes out of the ground in the crude state; men who think that the \$20 gold pieces come just as they are from the big gold mines, and the \$10 gold pieces from smaller ones, and the \$5 gold pieces from little mines; men who mine with their mouths and who don't know any more about real mining than mining knows about them, may say: "Why should we be wiser than our fathers? Go to!" But the real miners, the men who have developed the mines of this western country, know well the needs of the hour, and are proud to see one of their number, a miner like themselves, stand up in the Senate of the United States and speak for the industry that sent him there. Any one who has followed the course of litigation caused by the United States statute in question will see that nearly all those big suits ended by some stipulation or agreement defining the rights of both parties without reference to the "law," or else by buying out the weaker party.

"Might means right" has too long been the working motto for mine litigation. Let the incentive to such injustice close by proper amendment to United States revised statute 2322. Such action is a present necessity and in the interests of the miner.

Meanwhile this subject is deserving of discussion now just as much as ever. Nothing is ever settled until it is settled right, and by the time Congress meets again there ought to be a general consensus of opinion on this matter.

THE time has about arrived where the chemist is as important in mining as the geologist. Chemical geology, like electro-chemistry, is a branch of organized knowledge that will have intimate connection with the commercial side of mining and metallurgy. The chemical constitution of ore bodies as such furnishes an interesting and suggestive field of action

FLAT wire hoisting rope in constant use is all the for being tarred once a week, the cage being repeated to the collar of the shaft and slowly lowered, the hot tar is applied in a thin layer by one man on each side of the rope. The mixture is made of one barrel of pure tar to twenty gallons of beef tallow.

ADAPT the process to the ores, not the ores to the process. "Our ores are refractory" one hears less frequently than ten years ago. Few so expressing themselves have any knowledge of metallurgy. In the gold the ores do not contain a base but that can be eliminated by processes and methods that are generally in use.

IN one of the mills of the Alaska-Treadwell Co., Douglas Island, Alaska, containing 240 stamps, they were operated 312 4 days of twenty-four hours each in one year; number of shoes worn out was 501; number of dies worn out, 570; stems broken and replaced, 150; new cams in, 20; new cam shafts, 6; mortars broken, 7. The quantity of ore crushed in the mill was 225,272 tons, averaging 3.01 tons per stamp per day.

AMERICA leads in the world's supply of the two metals foremost in the electrical field, copper being the positive metal and zinc the negative; but, though only a positive metal, no substitute for the latter has yet been found. The smelting of zinc is expensive, a large amount of coal being usually required to smelt it, this being usually done by vaporizing the ore and then condensing; there are few ores so volatile. The world's production of zinc is estimated at about 500,000 tons of which this country produces 300,000 tons.

THE earth is 8000 miles in diameter and except for a thin shell is probably hotter than any furnace yet devised by human skill. Estimates differ as to the thickness of this crust. Temperature increases with descent. Mines and oil wells at an average of 1° for every 50 ft. Assuming that the mean for the earth's surface is 59° F., the boiling point of water, 212° F., would be reached at a depth of about 8000 feet. Between 30 and 60 feet down the heat is sufficient to melt the hardest known substances. At that distance a temperature of 400° F. probably exists.

A DIRECT-ACTING engine is one in which the reciprocating parts, viz: the piston, crosshead and connecting rod, operate in a straight line between the cylinder and crank, as in the ordinary horizontal stationary engine, without intervening rocker shafts or any multiplying or reducing mechanism. When the shaft is located at one end of the cylinder and the crossheads and guides at the other, it is called an indirect-acting engine, sometimes styled a hack-action engine. A single-acting engine is one in which steam is admitted at one end of the cylinder, and on one side of the piston only. Thus the piston only receives one impulse during each revolution.

A GOOD and economical boiler is well constructed of the best materials, adapted to its work and of a capacity that meets the requirements, so set as to be economical of fuel and have proper facilities for the water to circulate in it. The space between tubes should be about one-half the diameter of each tube, for when they are much closer, or so set as to materially impede the circulation of the water, the best results cannot be attained. The boiler should be easy to clean and keep in repair, and so braced, bolted and set that it will stand all the sudden shocks and changes of temperature and pressure to which it is subjected without injuring its connections or foundations. As heat expands and enlarges the whole structure, the boiler should be so set that all parts of the brick work may be equally subjected to it, and the change made as uniform as possible in every direction.

UNEQUAL expansion and contraction in the parts of a boiler are severe tests of the strength of the material used in its construction. The larger the heating surface the greater the effect of the expansion and contraction, and for boilers set more than one-half exposed to the atmosphere great danger is liable to occur if they are not slowly heated and cautiously handled. The danger from these changes is much greater than that from the pressure of the steam, and the leakage and ruptures that so often occur near the bottom of horizontal boilers are generally traced to this cause. Too rapid firing is often to blame for leakage and injury to boiler heads. Suddenly heating the flues causes them to expand more rapidly than the shell expands, and when most of the tubes are placed near the bottom of the boiler, the expansion causes unequal strain on the boiler heads, which is occasionally sufficient to produce rupture of the plates, and at least cause dangerous leaks that are difficult to remedy.

THE mountain chains which now constitute the topographic limits of the Pacific coast downfold are composed of links that differ in age and composition. Although nearly in line, the Sierra Nevada and Cascade ranges are distinct. The Sierra Nevada is composed chiefly of three masses of rocks: sedimentary and igneous rocks of various ages from Silurian to Juratrias, which have been profoundly altered and have developed a schistose structure; large masses of granite intruded into later than the preceding, and lavas which have erupted through and flowed out upon the other rocks. The principal deposits of gold occur in the first-mentioned series and in gravels derived from it. The northern continuation of the Sierra Nevada uplift is represented geologically in the Blue mountains of Oregon, the rocks of the two being similar. The Cascade range is younger and is wholly of volcanic origin, from Lassen Peak, Cal., to the south to Mount Rainier, Wash., on the north. It

is a pile of lavas which have flowed from hundreds of vents. From a few of these vents eruptions have been repeated so often and during so long an epoch as to build up the volcanic cones of which Shasta, Hood and Rainier are examples. Northward from Rainier the Cascade range resembles the Sierra Nevada in composition.

COMMERCIAL STORAGE BATTERIES are usually made with lead plates immersed in dilute sulphuric acid. The chemical action which goes on in these when current is being passed through the cell or used from it roughly consists in transferring oxygen, which exists in oxide of lead, from one plate to the other. The plates are generally arranged in such a manner that they will contain a great amount of oxide of lead. This is frequently accomplished by perforating the plates and filling the perforations with a paste which consists of lead oxide moistened with sulphuric acid. In preparing dilute sulphuric acid always pour the acid into the water, never the water into the acid. Lack of charging if continued long enough will result in sulphate forming on the plates which is indicated by white patches. In this condition no time should be lost in applying the charging current and allowing it to continue, after the cells are apparently fully charged, at about half rate until the sulphate entirely disappears. Always add pure water to the solution to make up for loss of evaporation, which, however, should not be added in large enough quantities to reduce the specific gravity to any considerable extent. The solution should never be allowed to get below the top of the plates.

A ROUGH AND READY ORE TEST, when an assayer is not available, may be made as follows: Take a sample of from ten to twenty pounds—the more the better. Select it without discrimination, so as to obtain a sample of the average character of the material of the vein where the sample is taken. Crush all the ore to about the size of walnuts and from this lot, by quartering down, take a sample of about three pounds. Pulverize this sample so as to pass it through a 40-mesh sieve. From this, by further quartering, select a sample of one pound to be tested as follows: Weigh out the sample (one pound), then work it down carefully in the batea, or pan—preferably the batea—until most of the sands have been washed off. Then add a few drops of quicksilver, which bring in contact with the gold by rubbing it throughout the pulp. Collect the small amalgam and boil it slowly in nitric acid, in a test tube, until the quicksilver disappears. The application of heat (of an alcohol lamp) hastens the process by dissolving the quicksilver. Pour out the acid carefully and wash out with water all traces of acid left in the test tube, then pour the gold carefully into an annealing cup and heat over the alcohol lamp until the gold is thoroughly dry, and then weigh it. This gives the amount of free gold per pound of ore, from which the free gold per ton may be readily calculated. An approximation of the fineness of the gold can be made by the eye sufficiently accurate for the test. Instead of cutting the amalgam by the use of nitric acid, the quicksilver may be volatilized by the blowpipe. The tailings from this sample should be saved and the sulphurets collected by washing off the sands. Then weigh the sulphurets, and from this weigh the percentage contained in the ore as ascertained by the assay or test made to determine the value per ton. A few vials, with carefully weighed amounts of gold, will be found useful for comparison with the pannings made upon the field. Such measures materially improve the guesswork otherwise practiced.

MINING had no sooner begun in California than it became apparent that water would have to be used, and that there must be some sort of "right," more or less permanent, to take and hold it. There were local mining laws at first that governed this. The miners first there found themselves without law, and every mining camp had to make its own laws; although these were scattered over hundreds of miles, they were nearly the same all over the State, the water right laws included, showing that the American left untrammelled by technicalities will get things about right. These mining regulations soon found themselves in the statutes of the State. Under this law a man or a company could post a notice at the point on a stream where he proposed to take out the water, stating how much water it was intended to divert and for what purpose. The appropriator then had to show bona fides by beginning work in a given time and had to prosecute it continuously to completion. Water so taken up and appropriated could be used by the appropriator or could be sold. The miners found but little difficulty in applying the law. When, however, water was "taken up" for irrigation purposes the question of riparian rights—the right to look at all the water in a stream on whose banks he owned land, flow past him unpolluted and undiminished in quantity—became the leading issue. The constitution of the State had provided that the common law of England should be the rule of action for the courts and the courts held strictly to it. No one could take water out of a stream for irrigation and return it all back again. Millions of dollars were spent in this litigation, and it ran through years of time. Of course, from small streams, where there were no riparian owners below the appropriators, and from reservoirs, irrigation went on uninterruptedly under this plan—no law was in such cases needed. In many cases the law of the shotgun prevailed, and, for that matter, the law of the shotgun, outside the district law, now almost entirely inoperative, is the only law California has for taking water out of a stream on which there are contesting riparian owners.

Briquetting: How It Is Done.

Written for the MINING AND SCIENTIFIC PRESS.

This subject is discussed by prominent managers and general superintendents of blast furnaces, silver, lead and copper smelters, as well as by the owners of coal mines and coke ovens. Some briquetting ma-

accomplished by heavy rollers running over the material on a circular track. The material, being alternately plowed and rolled, becomes plastic, resembling stiff clay, and in this condition is pressed into molds which are located in the track of the rollers. After the briquettes are formed in the molds they are further densified by a heavy pressure applied by a set

heated by waste gases from hot stoves or boiler stacks. This heat ranges from 210° to 330° F. When the ovens are properly arranged the heat is received under each car and taken away into flues through openings placed directly over each car. With this method the briquettes dry usually in from six to twelve hours. They are then strong enough to stand the rough handling incident to the automatic charging devices used in blast furnaces.

A desirable bonding agent for this class of work is 6% to 10% of thoroughly slacked and aged lime. Lime is improved in strength and plasticity when slacked and allowed to stand covered with water in settling tanks. A method has been devised to insure proper slacking of the lime in which rotary slackers are used. The lime is drawn from the slacker, through screens, into the settling tanks. When ready to use, the surface water is drawn off and the thick lime putty is taken to a horizontal tank in which are arranged revolving blades, which keep the lime from settling. When thus agitated the lime is readily pumped into a conveyor mixer, into which the fines are being fed.

When the material to be briquetted carries sufficient moisture dry lime, powdered, is used as a bond instead of cream of lime, the moisture in the mixture being sufficient for slacking the lime. Apparatus has been produced for producing pulverized calcium oxide of lime, dry and free from impurities. The amount of lime and ore fed into the mixer is regulated by adjustable automatic measuring devices. The conveyor mixer is built like a pug mill, having revolving blades attached to a center shaft at an angle of 30°, spaced 3 inches apart. Each blade is independent and can be removed and replaced without interfering with the others. From the conveyor mixer the material descends by gravity to the press. Thirty-five

Lime Slacker, Automatic Feeder and Measuring Device, and Conveyor-Mixer, Manufactured by Chisholm, Boyd & White Co.

Improved Briquetting Press, Manufactured by Chisholm, Boyd & White Co.

chines are built on the principle that heavy pressure only is necessary to make perfect briquettes. Others have been working on the lines of a thorough kneading and mixing of the bonding agent with the material to be briquetted. That method is by some deemed best in which perfect mixing and incorporating of the bonding agent with the material to be briquetted is the main feature. This mixing is

plungers operated by a toggle and lever mechanism. The briquettes are next ejected from the molds, deposited on a belt conveyor arranged to deliver them either into storage cars or trays, and then delivered by rail to the charging floor or bins convenient thereto. Where the storage capacity is limited, or where it is desired to hasten the drying of the briquettes, they are passed through drying ovens, which can be

horse power is required to drive the press and the auxiliary machinery.

The field for briquetting is large. Engineers have successfully treated many kinds of fine materials—coke and charcoal breeze, bituminous and anthracite coal fines, concentrated iron, copper and lead ores, mattes, roasted ore, flue dust, purple ore, bauxite, manganese and slimes from concentrators and elec-

trolytic vats. With silver-lead ores it is asserted that a saving in blast pressure of nearly one-half could be made by crushing and bedding all the ores, together with the flux and the coke breeze that collect around the plant, and briquetting the entire charge. Thus there is a saving in steam power and of the heretofore wasted coke.

The size and shape of the briquettes, which are either 4 or 3 inches in diameter and 2½ inches thick, allow the gases to freely pass through the charge, eliminating the tendency to hang and scaffold. The actual increase in furnace capacity, with briquettes charged instead of fine ore, is usually 10% to 15%.

The cost of briquetting, including all labor, power, bonding agent, oil, waste and repairs, is stated to be from 50 to 80 cents per ton of briquettes—dependent upon the location of the plant, cost and percentage of bond used, and cost of fuel and labor. While lime has proven to be the best bond under ordinary conditions, being beneficial to the furnace burden, other bonds are available where lime would be detrimental to the results desired. Dextrine, or molasses waste, or a combination of both, have proven satisfactory and inexpensive. Anthracite or bituminous coal dust, coke breeze, or a combination of these substances, when properly treated with the above bonds, make a briquette that is almost as strong as the original substance and gives similar calorific value, with the additional value of burning almost smokeless. Machinery is designed to handle either large or small quantities, so the proposition is within reach of any one having waste product to be treated.

Furnace managers and smelting machinery builders have often tried to solve the proposition of handling the fine ores and waste. None have been altogether successful, and some are now turning their attention to briquetting. Seventy plants are in operation in this country, two-thirds of which are for this special purpose. Full charges of briquettes, with lime bond properly incorporated and hardened, have been carried in both lead and iron blast furnaces, and experiments have shown that they do not decrepitate under pressure of the blast and the influence of the gases.

The Chisholm, Boyd & White Co. of Chicago, Ill., are manufacturers of a line of briquetting machinery which they claim embodies the processes essential to satisfactory and profitable briquetting. They are prepared to install plants arranged for handling any material, and will submit designs for the construction of plants which they guarantee to produce satisfactory results at initial cost and operating expense.

Malay Peninsula.

The lower half of the Malay Peninsula consists of the States of Perak, Selangor, Pahang, Negri, Semillan and Johore. The first four are known as the Federated Malay States—which are under the protection of Great Britain—and Johore will probably enter the Federation. To the north of these are numerous other Malay States, unexplored as yet, nominally under Siamese influence, but closed to European exploitation. The Federated Malay States, especially Perak and Selangor, contain far the largest and richest tin mining fields known. They supply at present about four-sevenths of the world's output of tin. These tin deposits stretch from the north, through the independent Malay States, into Siam, and the province of Yunnan, in China, and south into Sumatra, Banca, Billiton and other of the Dutch Indies.

A rough estimate of the world's present yearly supply of tin may be stated as follows:

	Per Annum. Tons.
Federated Malay States.....	45,000
Independent Malay States, Siam and Yunnan....	4,000
Dutch Indies.....	15,000
Australia and Tasmania.....	3,000
Bolivia and Peru.....	4,000
Cornwall.....	4,000
Total.....	75,000

Compressed Air for Pumping Oil Wells.

At Bakersfield, Cal., compressed air is in successful use for pumping oil wells. The air is piped from the air compressor to the well, a 1-inch pipe run down into the well and connected with a ¾-inch tubing near the bottom by a U-joint, though in some cases two or three pipes are connected, one at the bottom of the tubing, one at about three-quarters distance down and one about one-half the distance. In starting the well pumping they are all turned on together until the column of oil is started, when the intermediate connections are shut off and the lower one will do all the work, usually requiring about 120 pounds pressure in an 850-foot well, 14 gravity oil. By this method everything above the connections is carried out of the tubing and the deeper they are submerged the better the results. In this way the sand, which has been the source of so much trouble, is not allowed to accumulate, but is carried out with the oil, and, by gradually lowering the tubing, the well is cleared of whatever sand may have accumulated in it.

Hoisting Works for Deep Mines.

NUMBER III.

H. W. Hughes thought that many difficulties which were raised by the author of the paper were more imaginary than real. The problem was to get a rope maker to make them a light rope strong enough, and if it were possible to make a taper rope of equal excellence so far as constructive merit was concerned, and to work for the same length of time as a cylindrical rope, possibly the taper rope might be the best. The chief points seemed to him to have a rope as light as possible, and a drum as light as possible, and a steam pressure as high as possible. Steam pressure was going up, and so was the breaking strain of wire ropes, and the tensile strength of steel, which made it possible to use a lighter rope, a larger drum which did not weigh any more than the smaller drums of a few years ago and small cylinder engines running at high piston speeds, so that if they could wind from every known depth at the present time and from every such depth which would be likely to arise in the near future they had developed enough ground to last them for another generation. It did not appear to be worth while hothering themselves as to whether they might have to go to some problematical depth, when, by the time it was reached, the steam pressure and tensile strengths of steel would have increased to such an extent that the engineers of those days would be just as easily able to produce the necessary machinery to wind from such depths as they were at the present time. Personally he thought that two-stage windings from any reasonable depth—and he used the word "reasonable" as applying to such depths as 6000 feet—was quite out of the question from an economical point of view. It was not a question of designing the most theoretically perfect winding engine, but it was a question of making that winding engine get as much stuff out of the mine in the shortest possible time. By doing so they reduced the cost of labor per ton for every additional ton they raised above the normal, and they could only get large quantities by winding at an exceedingly rapid speed. The great time wasted by a winding engine was in starting the load. Everybody who was practically connected with mines knew perfectly well that there was a point in the shaft where, theoretically, it was advisable to shut off the steam and allow the engines to gradually come to rest, but he doubted whether there was any one mine in existence where steam was shut off at that theoretical place. The engineer went on as far as he dared, and then put on his brakes, the object being to keep up the speed as long as possible, for he could only make the average speed by obtaining at some part of the wind a very large maximum speed. He had not had time to thoroughly read the whole of the paper, but he certainly thought that Mr. Behr had in his calculations put at a very low estimate the maximum speed which could be obtained in the shaft. There were a very large number of instances in which a speed of 55 feet a second was commonly attained, and, if they could get at that speed safely in a shaft 3000 feet deep, why should they not get it up or exceed it in a shaft 6000 feet deep? Personally the problem seemed to be entirely, as far as he could judge of it at present, one for the rope makers and not for the engines. Ropes must be made lighter and stronger. There was certainly no depth which they knew of that the mechanical engineer could not design the winding engines for.

E. P. Rathbone said he would like to emphasize again his objections to the two-stage system mechanism of ventilation. After what the last speakers had said with regard to direct winding, and considering what they had been taught as colliery engineers, it seemed to him of the first importance at those great depths, with the increased temperature that might eventually be found in the deep levels of the Rand, that they should not go and put down shafts of this two-stage type, as if they did they might find that their construction would so prevent ventilation that they would find it a very great drawback indeed. That was an extremely serious point, and more serious than was apparent at the first sight of things. When they thought of the very great care that was taken with circular shafts to reduce the question of resistance of the air current in the collieries, they might also have to come to forced ventilation and fans on the Rand, and practically adopt what had been done in colliery work, and considering that the direct winding could be done, and there were no great objections mechanically, then they must take into consideration the question of ventilation, which was one of very great importance indeed.

Dr. Simon said that the ropes had gradually from the first time of winding decreased in size, and it had been pointed out that they would disappear altogether. This seemed a very tall statement to make, but if the present enterprise of bringing a railway to the top of the Jungfrau, the last stage of which was through a vertical tunnel, wherein, he understood, a cage would be moved by compressed air, were successful, a proof would be given that compressed air certainly would be the means of overcoming any depths, and they had not to take into consideration the rope maker any more.

Dr. Le Neve Foster said, with reference to the remark of the last speaker, that the pneumatic method

of hoisting was not in nubibus, but one which had actually been used in practice. Many of the members were doubtless aware that M. Blanchett many years ago had introduced his system of hoisting without any rope at a colliery at Epinac, in France, and that it had worked regularly for some time. Mr. Blanchett's apparatus was simply a piston in a big pipe, which was sucked up the shaft with a cage hanging to it. The cage carried nine wagons, and each wagon carried half a ton in it. Therefore it had been settled practically that they could hoist minerals from any depth without a rope. The method was given up at Epinac, not because it failed to act practically, for coal was brought up and men were regularly lowered and raised by the apparatus, but because the coal failed—there was not a sufficient amount of coal. Blanchett's system was described in the late seventies by various authors, and full details of this method of raising mineral or raising men could be found in various technical transactions. He was surprised to find that no mention had been made of the traversing drum in use at the Dolcoath mine, Cornwall. It is a traversing drum 20 feet in length, 10 feet only in diameter, and with each wind the drum was shifted laterally the diameter of the rope plus ¼ of an inch. It rendered it possible to wind from any depth with a small cylindrical drum without too much deviation between the line of the rope and the line of the pulley.

Alfred James said the point of diminished output speed seemed to have been overlooked by the previous speakers, who recommended only a single stage of winding, or rather it was not overlooked, but the emphasis was placed on the wrong side. Mr. Irvine wanted a direct drive "done rapidly" because of the time taken up by any stoppage for a second stage. Mr. Graves spoke about an express train, but Mr. Graves and Mr. Irvine forgot that an express train was a rapid proposition for a long journey only because they could have more trains on the same line. In double stage winding they would have double the amount of stuff in motion. If they had to take 10,000 tons from the bottom of the shaft and had a journey at the swiftest direct speed ever attained but which took ten minutes that would be impossible, but if they could break that journey up into five stages with a 50% slower total speed which would only take three minutes for each stage, then they had a chance, taking up five times as much stuff in fifteen minutes as the swiftest speed would take up "direct" in ten minutes, or a gain of over three times the output. The ideal method, of course, would be to have a number of skips coming up and down in continuous rapid motion on the principle of an elevator. As they could not have that, the next best thing seemed to be to have the speediest number of stages, taking into account the number of stoppages and the total speed of winding attainable, so as to take out the greatest amount of material in any given time and that was an advantage that the two-stage had over the direct system, which blocked transport during the whole period of transit, except for the one skip-load actually being raised.

(TO BE CONTINUED.)

Electricity Direct From Coal.

Hugo Joul, of Chicago, claims to have successfully solved the problem of producing electricity direct from coal. In his apparatus, as described by him, there is a retort surrounded by a cylindrical case containing a battery of four cells. The furnace gases from the retort circulate around the furnace and against the inner side of the case containing the cells, thereby heating the latter. Each cell is divided into three sections by partitions of porous clay. One of these sections contains nitric acid, the adjacent section contains sulphuric acid and the third and larger section contains a ferric chloride solution. In the latter section there is a lead electrode, and the nitric acid section contains a carbon electrode. The operations are described as follows: "A suitable quantity of sulphate of lead is placed in the retort with a quantity of coal nearly sufficient to reduce the sulphate to sulphide, and the mixture is then heated until all of the coal is oxidized. The sulphide is freed from impurities which may have been brought into it by the coal, and is then mixed with sulphate of lead in sufficient quantity to yield metallic lead and sulphur dioxide, which reduction is effected by again applying fuel heat to the retort. The sulphur dioxide passes through a pipe into the larger section of the several cells, reducing the ferric chloride therein to ferrous chloride. Previous to this the generation of an electric current is started by putting the lead electrodes into the larger section and suitably connecting them with the carbon electrodes. The current may be considered as consisting of two currents, one generated by the action of the ferric chloride of the lead electrode, and the other by the action of the nitric acid through the interposed porous walls and sulphuric acid by means of molecular exchange of ferrous chloride. The flow of sulphur dioxide is so regulated that the sulphuric acid formed is not more than sufficient to decompose the chloride of lead formed in the battery reaction. The lead in the retort is allowed to flow into a pan where it is suitably shaped or solidified for an electrode. The sulphate of lead deposited by the battery is allowed to ac-

accumulate, and at intervals is drawn off by means of siphons, and the deposit of sulphate of lead on the lead electrode removed. The temperature of the battery is regulated so that the nitric acid which enters into the sulphuric acid section is evaporated, the vapors being passed through a condenser coil and there condensed again to nitric acid, flowing back into the nitric acid sections through a pipe. The process of distillation, oxidation and condensation is kept up by regulating the temperature of the battery and supplying sufficient cooling water to the condenser. Thus oxygen is supplied to the nitric acid, while the generation of electric energy with consumption of oxygen goes on. The e. m. f. of the cell at 100° C. is said to be about 1.75 volts.

The Kimble Drift Mine, El Dorado County, Cal.

Written for the MINING AND SCIENTIFIC PRESS by
GEORGE W. KIMBLE.

Part of one of the many channels under the lava-capped ridge south and east of Placerville, and between the South Fork of the American river on the north and Wehher creek on the south, constitutes the Kimble drift mine, formerly known as the Green Mountain Tunnel mine.

This channel was first discovered by a tunnel from north side of Chile ravine, extending northerly 400 feet into Cedar Spring hill, at which point an upraise of 10 feet was made to the channel and a tunnel continued up stream 1600 feet along and in the west rip. After a number of tests by washing the gravel, it was decided that the gravel was too poor in gold to pay for working. After years of idleness, the property passed into the hands of the present company.

After making numerous surveys, the writer became satisfied that the property could be made to pay and that the channel, in a long curve, passed under Chile ravine and under the hill to the south. Discovering an old tunnel running from Chile ravine to the south, it was decided to open both tunnels, as the channel could be worked up stream

have two cars loaded and ready on the main track on the return of the empty ones.

GRAVEL.—The gravel consists principally of a well washed quartz and rhyolite (lava) boulders, cobbles, pebbles and sand, intermixed with pieces of slate and lava mud, the latter being the cementing material. In low depressions, where the bedrock was hard, the gravel would be cemented to it as though it was concrete; in these places sulphide of iron in flakes an inch thick would be found in the gravel near the bedrock.

MODE OF BREAKING THE GRAVEL.—Augers with a "swallowtail-pointed" pod were used for boring holes where it was possible, and, wherever it was impossible, crooked-pointed bars, similar to the "Mexican bar," were used. Holes 2 feet deep were put in the bedrock and in the gravel for blasting, using 30% nitro powder. Experience showed that holes 2 feet deep in the bedrock, with holes of the same depth in the gravel and between those in the bedrock, did better execution than if they were deeper, at the same time using less powder. One not familiar with the auger and bar would be surprised at the rapidity with which experienced hands can put in a "round" of holes—twenty-five to thirty—in a breast 60 feet wide.

By this system of holes the gravel is considerably broken up, and, with good ventilation, there is but very little time lost in waiting for the smoke from so many blasts to clear away. After the smoke clears away the men return, pitch out and throw back all boulders and cobbles over 3 inches in size, at the same time shoveling the gravel into cars or onto platforms for the loaders.

TIMBERING.—On an average the ground is not heavy, and the timbering is done with single post and cap, with half lagging on cap, all of which is securely wedged. The caps are supposed to be 6x8x18 to 24 inches, trued up on the top and bottom, and are made from round and split timber. The posts are made of round timbers with a diameter of 6 to 10 inches. The average length for breasting is about 3½ feet.

VENTILATION.—Ventilation is secured by carrying airways in back part of breasts by building up walls of rocks, or by carrying drifts overhead when there were not rocks enough to build walls.

charge; but, after a careful test, it was found that there was no material difference in the quantity of gravel crushed with a single or double discharge; and as it required less water in the mortar for a single discharge, the backs of the mortars were closed. No copper plates were used or any quicksilver put on the mortars, depending on the quicksilver on the grooved tables and the first 12 feet of riffles to amalgamate all the amalgamable gold, that portion of the gold that was not clean and all the black sand to be caught in the remaining riffles. After the pulp passed through the 100 feet of riffled sluices it passed through traps, cobble-paved boxes and ground sluices for 600 feet; the gold from these amounted to only .001% of the gross yield.

The riffled boxes were cleaned up twice a month, the sands put in an amalgamating harrel, 24x48 inches, with six 2-inch round iron bars nearly the length of the harrel, and the harrel revolved for eight hours at a speed of twelve revolutions per minute, after which quicksilver was added and the harrel revolved eight times per minute. Tests showed that there was a thorough amalgamation made when the contents of the boxes was washed through riffled boxes and the amalgam recovered.

COST OF MINING AND MILLING.—From carefully kept accounts, the cost of mining and milling at no time exceeded 45 cents per ton, varying from 38½ to 45 cents per ton, owing to the distance the breasting was from the mill.

EXPENSES.—Miners, \$2.50; carmen, \$2; shift boss, \$3; power for mill, \$4 per twenty-four hours; timers, 2 cents per linear foot; blacksmith, \$2.75; coal, 1½ cents per pound; powder, 13 cents; fuse, \$4.50 per M; giant caps, \$5.50 per M; steel, 9 cents per pound; lagging, \$45 per M; wedges, \$6 per M.

In giving the cost per ton all expenses are included, except interest on capital invested in purchase of property and building mill.

Mexican Mining Notes.

[FROM A TRAVELING CORRESPONDENT.]

State of Chihuahua, Morelos Mining District: Situated in southwestern Chihuahua, on the San Andreas, or Rio Morelos, 3 miles west of the confluence of that

from both tunnels, thereby having natural drainage. The only difficulty that could be expected would be a sufficient supply of fresh air.

The Green Mountain tunnel, when the present company came into possession of the property, was about 2000 feet in length and badly caved, while the tunnel to the south was about 500 feet long and in a bad condition.

THE CHANNEL.—The channel has been worked out from the intersection of the south tunnel to a point about 1600 feet north of the Green Mountain tunnel intersection, or a total distance of 3000 feet. The average grade of the portion worked was 2%.

The bedrock of the channel was altered and normal diabase, talcose and black slates, with some quartz seams, all of which had a strike nearly parallel with the course of the channel.

MODE OF WORKING.—The channel was narrow and the pay gravel tortuous, with abrupt rims. The breast seldom exceeded 60 feet in width, the average being about 40 feet. In that part of the mine where the Green Mountain tunnel followed the rim, branch gangways were run in the trough of the channel, in order to keep the cars up with the breasting, and in that portion from the south tunnel to the intersection of the Green Mountain tunnel the main gangway was kept in the center of the trough as near as possible, in order to drain the ground and handle the gravel to the greatest advantage. As a result, all new gangways were very crooked; but as the track was twelve pounds to the yard steel rails and a down grade for loaded cars, they would run double by gravity. There were two carmen for each tunnel, who rode their cars out and brought in timbers, tools and all supplies. At each breast there were two or more switches, where the empty cars were switched off as soon as they were brought in, as the loader would

MILLING.—After opening the Green Mountain tunnel and the old tunnel to the south, it was deemed advisable to erect a 10-stamp mill. It was found that the mill would have to be located 350 feet from the portal of the Green Mountain tunnel and 500 feet from that of the south tunnel, in order to get low enough to have an ore bin and the use of self-feeders, and at the same time have a water power.

The mill, as it was built, was ten stamps of 700 pounds each, with Challenger self-feeders, and a water power under a vertical head of 185 feet.

The gravel was dumped into the ore bins from ton cars; from the bin it passed into the self-feeders, thence into the mortars, where it was crushed by the stamps dropping 6 inches 110 times per minute; after which it passed through woven steel wire screens with five holes to the inch, set with the bottom 2 inches above the top of the dies. The pulp, as it discharged through the screens, fell onto the lip of the mortar, thence onto grooved tables 5x6 feet. The grooves were of two sizes and crosswise of the tables. The first groove, which was at the lip of the mortar, was ½-inch wide, ½-inch deep on the front or downstream side, with the back of the groove heveled back under and deep enough to make the bottom level when the table was set on a grade of 2 inches per foot. The next groove was made on the same principle, but was 2 inches wide, with a 4-inch space between it and the first. The narrow and wide ones alternated the full length of the table. These grooves were filled with quicksilver. The tables were made of clear sugar pine 3 inches thick, with covers that could be locked.

After the pulp passed over these tables it dropped onto 100 feet of sluices, with heveled riffles the entire length. [See drawing for explanation of riffles.] When the mill was first built it had a double dis-

stream with the Rio Seneriho, lies the old silver mining town of Morelos. Thirty years ago Morelos was one of the principal gamhusino pueblos in the State of Chihuahua, but to-day the rich surface ores are exhausted and the lead and silver mines of the locality lie dormant awaiting capital to provide the means for working the mines to a greater depth by modern means of extraction. The town presents the same appearance as the old mining camp of San Jose de Gracia in Sinaloa. The architecture and outer trimmings of the grim and silent buildings give evidence of a richer past. Tributary to the pueblo of Morelos are the reales of Los Tajos and La Duro, where American mining men have taken hold and are doing exploitation work with satisfactory results. Further down the Rio Seneribo, what is known as the Promontorio ledge runs through the country in an easterly direction, on which are situated many antiguo mines. This ledge can be traced through the country for 50 miles to the big mining camp of Batopilas. The values of the entire ledge exist in pockets of native and ruby silver. The ore of this section resembles that of the old Aspen Consolidated, which was situated on Aspen mountain, south of the town of the same name in central Colorado. Silver placers exist both at the foot of Aspen mountain and where the Promontorio ledge is cut by the Rio Seneribo. The two principal mines on this belt are the San Gil and San Pedro, which have produced over \$3,000,000 in silver. The oldest mine in the vicinity is the San Joaquin, which consists of nine pertenencias of land and is owned by the Molaney Bros. of La Duro. Mexican gamhusinos are at present taking out a promising class of ore from this property. All the silver mines of this section carry a high percentage of lead and are generally self-fluxing. The Molaney Bros. of La Duro, besides owning

the San Joaquin mine, are interested in some silver and gold mines in the vicinity of Los Tajos and Morelos. A small Huntington mill is on their property at La Duro. This is being torn down and a small stamp mill will be erected to test the ores from their various holdings. Messrs. Milliken & Burgoyne own and operate the Rico mine at La Duro. The property consists of five pertenencias and the values are found in gold and silver. A shaft 150 feet has been sunk, which carries a vein varying from 2 feet to the thickness of a knife blade. The ore is free milling and averages about \$1000 to the ton. A 3-stamp mill is in operation on the property.

District of Guadalupe: At Schollitas J. Robinson of Kansas City is working the Victor mine, which consists of fifteen pertenencias of land, and is a free milling gold ore. The main workings consist of a 150-foot shaft and 200 feet of tunnel. A 2-stamp mill is in operation on the property and the values are found in porphyry and quartz. The ledge runs south to the Los Taros mines and still farther south to where the high country breaks into the harrancas of the Rio San Domingo. Schollitas is situated at an altitude of 8000 feet above sea level on one of the southeast branches of the Rio Fuerte. Freeman and associates have denounced several gold and silver mines in the vicinity of San Jose de Cruz, Rillito and Los Taros. Ivy, Moulton & Co. are working the Sierra Colorow mine, which runs well in gold, silver, copper and lead. The owners propose to erect a 30-ton smelter to treat their ores. West of the Sierra Colorow are the La Cumhre and Los Angeles mines, owned by American mining men. The ores from these properties are principally gold bearing, a large percentage of which is free milling. At La Cumhre a 10-stamp mill is in operation and the production of mineral exceeded \$1,000,000. The property is a steady producer at the present time. The railroad which has connected the mining town of Parral with the Mexican Central Railway has infused new life in that camp, and several claims which could have been bought three or four years ago for a few thousand dollars have recently been purchased for amounts in the six and seven figures. Parral is one of the oldest mining camps in Mexico and has been worked continuously for over 300 years. The town boasts a population of 40,000, and at present in the matter of silver production is a close rival of Guajuata and San Luis Potosi.

District of Santa Eulalia: The district of Santa Eulalia is attracting the attention of mining men and many new denunciations are being made in that section. A recent strike gave an assay of 1000 ounces in silver. Statistics from the Geographical Society of London place the mineral product of this district at \$400,000,000, while Wilson, the historian, estimated it at \$750,000,000.

District of Jesus Maria: The Pinos Altos mines have been sold recently and the new owners propose to operate the property on a large scale. A 100-ton plant is situated on the property, and the value of the improvements will exceed a quarter of a million dollars. The mines have been famous for their gold production. Nearly all the mines in this district change from gold to silver as depth is acquired.

State of Sinaloa, District of El Fuerte: Recently nearly \$10,000,000 has been subscribed for stock of the Kansas City, Mexico & Orient Railway. Locating parties are engaged in running lines between El Fuerte and Agua Caliente de Baca in Sinaloa, and from Minaca west to the Sierra Madres in Chihuahua. Several new contracts have been let for grading west of Minaca.

State of Chihuahua, District of Chihuahua: Work is progressing on the San Jose del Sitio Railroad, near the City of Chihuahua. Twenty miles of new grading contracts have been let. Owing to the pressure on American mills for rails the company have contracted their supply from England.

District of Guadalupe: C. Clark, son of the Senator from Montana, who has been operating the Rosario mines at Guadalupe Calvo, under a bond, has received a three months' extension. The property consists of sixteen pertenencias, and a 10-stamp mill is at present crushing a \$12 ore. It is estimated that over \$22,000,000 have been taken out of these mines. The ledge is in some places over 150 feet wide. Prof. F. A. Shiertz is Supt. and J. Ago is mine foreman. Farther south is situated the mine and mill known as the Garcia. This property is lying idle at present. Between the Rosario and Garcia mine lie a number of pertenencias upon which the Mexican G. & S. Recovery Co. are paying the taxes. The ledge passing through Guadalupe Calvo can be traced for a distance of 75 miles.

New Business.

TO THE EDITOR:—This company has been organized for the purpose of constructing the work proposed by the Tonopah Water & Power Co., and will let contracts in a few weeks for a large amount of work and material. We will first let the contract for digging a ditch 3 feet deep a distance of 65 miles, after which will come the pipe contract, either 10" or 12", which may be either of wood, iron or steel. This will undoubtedly be the longest pipe line in the country, as there is no other spot probably such as Tonopah

where one could locate a town so far away from both wood and water.

The pipe will conduct water from Twin river, Smoky valley, Nev., into Tonopah, while we will generate electricity at Twin river and transmit same with a potential of 30,000 volts. We will also build a complete mill at Tonopah for handling at least 200 tons of ore per day, the mill to be of the latest and best construction. Very truly yours,

L. H. ROGERS,
General Manager Nevada Construction Co.
Carson, Nev., July 7.

Cyanide Assay for Copper.*

(DISCUSSION.)

EDWARD KELLER: Mr. Miller's improved method of the cyanide assay for copper will, without doubt, be much appreciated by assayers and chemists who are engaged at copper mines and works. The writer, as one who, at one time, had much work of that kind to do, entertains no doubt of its practical value.

In enumerating the factors which affect the accuracy of cyanide titration, Mr. Miller omits to mention time. This I have always considered an essential one; i.e., in order to secure accuracy, I have believed it to be necessary to run the cyanide solution at the same rate of speed in standardizing as in the titration of the samples. I have accomplished this, without the use of a timekeeper and without noticing the volume of the solution, in the following simple manner: In running the cyanide solution from the burette, the stream was so regulated, by manipulation of the cock, that it retained its continuity for a distance of about 1 inch below the orifice, and, below that, broke into individual drops. This means that a constant pressure is maintained at the orifice of the burette, so that, during equal intervals of time, equal volumes of the solution pass through. The stream of cyanide solution was left to flow in the manner indicated until the blue ammoniacal copper solution began to show a distinct change in color, after which the cyanide was added by drops at regular intervals until the desired end reaction. When several burettes are used they should have orifices of equal diameter; otherwise, the time factor must be considered separately for each.

In accordance with Mr. Miller's views, I have always considered the cyanide method as of very satisfactory accuracy for all copper assaying in which I did not employ the electrolytic method. It may interest some of my colleagues to know the modified method which I employed some fifteen years ago in making great numbers of copper estimations on ores and metallurgical products of the Butte district. The metals to contend with, as deleterious to cyanide titration, were mainly iron, manganese, and zinc. The mode of operation may be briefly given as follows:

One gram of ore, or other material is dissolved in about 5 c.c. of strong nitric acid; the excess of acid is expelled; the residue is hoiled with a few c.c. of hydrochloric acid; the solution is diluted to about 100 c.c.; ammonia is added to slight alkalinity; the metals are converted into sulphides by the addition of from 1 to 2 c.c. of ammonium sulphide, the latter (prepared by conducting hydrogen sulphide through strong ammonia until saturation) being kept in stock; the solution is re-acidified with excess of hydrochloric acid; the insoluble sulphides are filtered out and washed; the filter, with residue, properly folded, is placed on top of three or four layers of filter paper in a scorifier, and incinerated in the red-hot muffle of the assay furnace; the incinerated residue is dropped into a beaker, dissolved in the desired quantity of acid, and prepared for titration in exactly the same manner as the standard.

The above described method has the advantage that the copper is practically precipitated instantaneously and completely, and the sulphides of iron, manganese and zinc are very quickly removed by solution in hydrochloric acid. If nickel and cobalt were present in appreciable quantities, this method would not be efficient, because, when once precipitated as sulphides, these metals are but slightly soluble in hydrochloric acid. Arsenic, being present as a volatile sulphide, is probably totally removed by the incineration. Antimony is probably volatilized only in part, but the remainder may be oxidized to insolubility. Should lead and bismuth be present in quantity, it would become necessary to remove them from the incinerated residue by solution in acid, neutralization with ammonia, and precipitation as carbonates with ammonium carbonate—thus necessitating an extra filtration. The incineration of the sulphides in the muffle furnace is very convenient and rapid. The placing of three or four layers of filter paper in the bottom of the scorifier prevents any adhesion of the residue to the scorifier, the simple tilting of which, therefore, allows the residue to fall into a beaker, as soon as the scorifier is taken from the muffle. At the time when I used this method I considered it the most rapid for the material for which it was devised, and I believe it to be a very practical method to-day. I am no longer in possession of any data of my own to show the accuracy attained in this kind of work. However, K. W. Mc-

Comas, my assistant, has lately made a series of titrations with known quantities of copper, to which were added equal quantities of manganese in one series, and zinc in another series—creating conditions far more unfavorable than are generally met in practice. The results are as follows:

Copper taken.	Copper found. After separation from zinc.	Copper found. Without separation from zinc.	Copper found. After separation from manganese.
Grams.	Grams.	Grams.	Grams.
0.0993	0.1050	0.1373	0.1016
0.1986	0.2110	0.2668	0.1992
0.2979	0.3163	0.3563	0.2989
0.3972	0.4223	0.5457	0.3988
0.4965	0.5284	0.7061	0.4962

It will be noticed that when the copper has been separated from the zinc the results are still somewhat too high. This is due to the fact that, when much zinc is present, its sulphide cannot be completely separated from the copper sulphide by hydrochloric acid. The results obtained by the titration of the copper without separation from the zinc show the utter unreliability of the cyanide method when it is used without that modification.

Liquid Fuel--Boiler Firing With Oil.*

NUMBER II.

By JAMES W. WARREN.

The oil is stored in two steel tanks, each 30 feet long by 10 feet in diameter, made of $\frac{3}{8}$ -inch steel, which are buried in the ground directly behind the plant. The tanks are buried end to end, 4 feet below the surface, and covered with a 4-inch wood logging treated with a wood preserver to prevent the alkali in the soil destroying the tanks. Between the ends of the tanks is a manhole 4 feet wide by 8 feet long, into which all pipes, valves and connections possible are made, affording easy access to make repairs. The tanks are connected together with both the supply and suction pipes and are filled and emptied both at the same time, but the piping is so arranged that it is possible to use each tank separately, affording an opportunity to clean either of them. The oil is delivered in specially built tank cars, holding from 155 to 300 barrels of oil. A rubber hose 3 inches in diameter is used to convey the oil from the tank cars to the tanks, and gauges arranged on the back of the plant show the amount of oil in each tank. It takes about forty minutes to unload a car of 6,500 gallons. Each of our tanks will hold about 17,000 gallons, and under the present conditions of operation this will last about half a month, affording us a fair storage capacity.

There are two 3x2x3 duplex steam pumps mounted on an iron frame standing about 3 feet 6 inches high. These pumps draw the oil from the storage tanks through a 1½-inch iron pipe into a small chamber about 14 inches in diameter by 2½ feet long, placed between and slightly above the pumps. The oil enters this chamber at one end, passing through a partition of very fine wire gauze into the other end of the chamber, where it comes in contact with a heating coil heated with the exhaust steam from the pumps. This runs the temperature of the oil to about 145° Fahrenheit, being the proper temperature at which the oil atomizes freely. The gauze screen or partition is used to strain the oil and keep back sand and dirt, which, if allowed to pass to the burners, would in time stop up the small openings through which the oil passes. The pump being a double one gives us a reserve in case of accident.

Experiments have been made with two burners, one known as a straight-flow burner and the other known as a cross-flow burner. Thus far we have been unable to see that one burner has any special advantages over the other as regards economy or ease of manipulation. In the straight-flow burner there is a central brass casting with a small hole through which the oil passes. The outside of this casting is fluted like the rifling of a cannon, and outside of this is another brass tube. The steam passing through this space and the fluting, gives it a whirling motion, so that as the oil flows out of the inner hole it is caught by the whirling steam and atomized. It is considerable work to set this burner in place, as there are many changes to make in the brickwork of the furnace. In order to atomize the oil thoroughly, the bridge wall of the furnace has to be reconstructed and a sort of grill work of firebrick put in its place. The grate bars are lowered about one foot in the firebox, and a double row of firebrick laid on top in such a manner as to form an air chamber between them through which all air must pass in order to reach the furnace, the idea being that the air becomes heated before coming in contact with the fire. There are two of these burners under each boiler, each one being set in the firedoor, and the door bricked up solid, except a small hole for looking into the furnace. When once set up it is rather difficult and expensive to change back to coal.

The cross-flow burner is constructed somewhat differently from the straight-flow burner. It consists of small casting with an overhanging top per-

*H. H. MILLER, Trans. Am. Inst. M. E.

*Read before the National Electric Light Association at its twenty-fifth convention held at Cincinnati, O., May 20, 21, 22, 1902.

forated with small holes arranged in a semicircle on the under side. Just below these holes is a slot in the burner through which the steam issues in a sheet, and the oil being forced through these holes comes in contact with the steam and is atomized. This burner is put through a hole between the firedoors, using only one burner to a boiler. The grate bars are left in the same position as when coal is used, and are covered with a layer of firebrick laid in mortar. These bricks cover the entire grate except a few inches in front for air, and the bridge wall is left as used for coal. The furnace doors remain unchanged. The principle of the oil burner is that the steam comes in contact with the oil and atomizes and separates it as widely as possible.

To convert a furnace from coal to oil will take from two to three days, and to convert to coal again from two to three minutes, where the cross-blow burners are used. After being once equipped for oil, however, and then converted to coal, it could be reconverted to oil again in about an hour.

In the use of fuel oil it is necessary, in order to get economical burning, to have the oil flow to the burners at a steady pressure. Our first experiments demonstrated the necessity of this, as our fires were often put out through unsteady pressure. With a steady pressure of steam at the burners, if the oil pressure decreases, the steam is likely to blow out the fire, while if it increases, more oil comes through the burners than could be properly atomized, the result being, 1st: The fire smokes badly. 2d: The excess of oil runs away in the ash pit, causing liability to explode. 3d: It fills the tubes with a soot that is much harder to remove than coal soot. 4th: The oil that is not atomized, and flows away, is lost.

In order to ensure a steady pressure of oil it is necessary to provide an auxiliary air chamber. Connected to this air chamber is a small safety valve which, in case the pressure runs above the point required, returns the excess oil to the storage tanks.

To start the burners it is simply necessary to turn on the steam and a small supply of oil, and throw a piece of burning waste into the firebox, and we immediately have a full fire. To regulate it properly it is necessary to adjust the supply of both steam and oil until the fire burns without any smoke; and if properly regulated we get a complete combustion of the oil and avoid almost entirely the presence of soot in the tubes and smoke from the stack. It is also possible, by simply increasing the supply of both steam and oil, to force the boiler to any extent. Care must be taken, however, in selecting burners to get one that thoroughly atomizes and distributes the oil so as not to confine the fire to any one part of the shell and burn the boiler.

The boilers are provided with peep holes in the back to enable the fireman to see the condition of his fire. Care must be taken to watch the fires very closely, and in case they go out for any reason to shut off the oil immediately, as the gas from the oil, combined with the air in certain proportions, is very explosive. Cases of this kind have been known where an explosion has occurred which took the damper up the chimney and blew out the front of the boiler.

(TO BE CONTINUED.)

Mining and Metallurgical Patents.

Patents Issued July 1, 1902.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ROTARY MIXTURE FOR CONCRETE.—No. 703,424; W. J. Judd, New York, assignor to F. C. Austin, Chicago, Ill.

Concrete mixer, comprising rotary mixing drum having oppositely arranged charging and discharge openings provided between openings with external ring gear; rotary driving shaft arranged under drum transverse to axis, about which drum revolves; tilting drum support forming double armed lever fulcrumed to tilt about axis of rotary driving shaft, gear connection between rotary driving shaft and gear ring on drum; anti-friction rolls arranged upon arms of lever engaging and supporting opposite end portions of rotary mixing drum.

MINERAL COMPOUND.—No. 703,516; McK. Arnn, Bristol, Va.

Method of treating slag from furnaces, consisting

of addition to molten slag of salt, lime, sulphuric acid, hydrochloric acid, coal tar, pulverized mica, talc, kaolin, clay and water, ingredients combined with slag substantially in proportions and in manner set forth, separating out of lighter portion of mass and subsequent pulverizing of compound thus formed after same has become cold and mixing with each 100 pounds pulverized mass thus produced of five pounds coal tar, one pound sulphuric acid, five ounces hydrochloric acid, mixing same with ordinary cement in proportion of 20% of product with 80% of ordinary cement.

ORE CRUSHER AND PULVERIZER.—No. 703,461; A. J. Petter, San Francisco, Cal.

In combination head; shell depending from head; second shell on outside of first mentioned shell; means for regulating pressure of one shell upon the other, comprising stem on head, spider slidable on stem engaging end of outer shell, spring seated on spider, bearing for upper end of spring, slotted ears on bearing, cam lever at end of stem working in slotted ears adapted to press upon spring bearing to tension spring.

TAPPET FOR STAMP MILLS.—No. 703,680; J. C. L. Vaught, Phillipshurg, Mont.

Device of class described, comprising tappet, lower tapering or wedge-shaped sleeve fitting within lower end of tappet, provided with horizontal corrugations or ribs adapted to engage stamp stem, and upper tapering or wedge-shaped sleeve provided with longitudinally inclined ribs or corrugations adapted to engage stamp stem, whereby the upper sleeve is fed downward.

AMALGAMATOR.—No. 703,694; J. V. Coleman, San Francisco, Cal.

In amalgamator, conical casing, conical spiral journaled vertically therein, inner surface of casing and upper surface of spiral being formed with amalgamating surfaces, each portion of periphery of spiral located interiorly of vertical plane through corresponding portion of spiral below it, exteriorly of vertical plane through portion of casing above it, spiral having unobstructed outer edge and means of rotating spiral upward toward smaller end of casing.

ROCK BORING MACHINE.—No. 603,890; J. Brejcha, Strasburg, and E. Schulte, Dusseldorf, Germany.

In combination in boring machine, boring rod, cylinder k, piston head f within cylinder, piston rod d connected to piston and within which boring rod is located, connection between hollow piston rod and boring rod, comprising head g, pin h and screw plug c.

APPARATUS FOR THE SEPARATION OF MINERALS BY THE SELECTIVE ACTION OF OILS.—No. 703,905; A. S. Elmore, London, England.

Apparatus for effecting separation of minerals by selective action of oils and like substances, comprising mixer of oil with aqueous pulp of pulverized mineral, incline for downflow of mixture having steps or baffles, endless apron, means for distributing oil over it and means of causing it to travel in direction opposite to downflow, conical revolving sieve adapted to receive discharge from incline, nozzle for delivering shower of water over one side of sieve, two launders, one lined with blanket adapted to remove matters that pass through sieve, the other to remove matters that are washed over sieve.

MINE VENTILATOR.—No. 703,831; P. T. Reynolds, Butte, Mont.

Combination with fluid supply pipe and cooling mixture tank of plurality of rotatable tubes arranged in vertical series, passing through interior of, passing through and journaled in walls of cooling mixture tank, each tube in interior of tank provided with sinuous bends in same plane, one end of each tube communicating with supply pipe and other end with atmosphere.

ELECTRO-METALLURGICAL TREATMENT OF ZINC ORES AND ESPECIALLY BLENDE.—No. 703,857; C. J. Tossizza, Paris, France.

For electrolysis of nickel, cobalt, cadmium, zinc, electrolytically deposited in metallic form at cathode, and other metals whose salts have a voltage of decomposition too high to avoid decomposition of sulphurous acid in medium of electrolyte, process effected with voltage lowered by employment of sulphurous acid as depolarizer, being divided into two parts to avoid decomposition of sulphurous acid, consisting in electrolysis of salt of metal with corresponding solution of copper anodes and formation of copper salt, and in the electrolytic reconstitution of copper anodes by decomposition of so-formed copper salt in solution preliminarily charged with sulphurous acid.

CONSIDERABLE coke is used in Arizona. The Bisbee smelting plants are credited with a daily consumption of 125 tons, Detroit Copper Co. 80 tons, Arizona Copper Co. 80 tons, Shannon smelter 40 tons and the Old Dominion of Globe 40 tons; total, 365 tons. This does not include the coal used, which is said to be about 27,000 tons per month.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ARIZONA.

COCONINO COUNTY.

Manager J. E. Jennings, of the Grand Gulch Co.'s property, reports that since November, 1899, shipments aggregating 1000 tons have been made, for which \$98,959.88 was received from the smelter; the controls show an average of 44% copper, five ounces silver and approximately \$1 gold per ton; \$29 per ton was spent for transportation, \$23 for wagon haul and \$6 by railway. The main shaft is 370 feet and will go to 800 feet. It is estimated that there are 3000 tons of ore that will carry 10% copper.

COCHISE COUNTY.

At Bisbee, McNichols and Ross of British Columbia drilled 41 $\frac{3}{4}$ inches in fifteen minutes in the contest on the 4th inst.

GILA COUNTY.

T. Crandall is superintending development Confederate M. Co.'s claims near Reno.

Supt. F. D. Adams, Bob Tail M. Co., near Globe, has started the mill. The Arizona Commercial Co., at the Copper hill mine, has continued work. Supt. W. S. Sultan had opened the mine to a depth of 600 feet and sulphide ore bodies had been developed.

The tunnel head of Mineral creek is in 250 feet. It has gone through 28 feet of sulphide ore carrying 4% copper.

At Globe the briquette works connected with the Old Dominion smelter will be ready Sept. 1. Experts who have been examining the Old Dominion properties are making favorable reports.

The main shaft and other improvements on the Globe-Boston are nearing completion.

GRAHAM COUNTY.

U. G. Wolf is Supt. Polaris G. M. Co., near Clifton, on the Nonesuch and Golden Eagle claims. The Nonesuch is showing 18 inches of ore. The 20-stamp mill will be ready to run in September.

MARICOPA COUNTY.

T. J. Carrigan and D. Morgan, Supt. and foreman of the Congress mine, are developing a group of eleven claims adjoining that property. The work is being concentrated on the Lucky Dave.

MOHAVE COUNTY.

A. J. Doran, who has the Nighthawk mine near Kingman, proposes to put a hoisting plant thereon.

A concentrator may be put on the Gem mine at Cerbat.

PIMA COUNTY.

C. Udall, Supt. Century Ore Co., is operating a cyaniding plant at Mammoth. He says his company has a contract with the Mammoth-Collins Co. to treat 300,000 tons of tailings. The plant is using 200 tons daily. The value lies in the molybdenite of lead extracted used in the hardening of steel. He says the Century Co. has a contract with the United States Steel Corporation to furnish the entire product of the plant. The mine produces two and one-half tons of concentrates daily, which is shipped to a smelting plant in Pennsylvania.

McPhaul & De Span have sold their mining claim to Dent & Pollock of Flagstaff for \$10,000 spot cash. The ore carries copper, gold and silver. The present owners propose to put machinery on for development. This property is in Pimosa district, about 100 miles from Tucson.

SANTA CRUZ COUNTY.

At Washington the Pride of the West has in operation a combination process of magnetic and water concentration, and smelting in a reverberatory furnace; the pulp from hearth roasters falls into hoppers, upon broad belts, where it is automatically spread to a depth of $\frac{1}{4}$ inch. These belts pass closely beneath magnets, across the faces of which run other belts. The magnets pick the copper particles from the pulp, they adhering to the under side of the belts passing over the faces of the magnets, until they have passed beyond, when the copper falls upon a carrier, to the reverberatory furnace, which produces a 60% matte.

G. W. Bibbens, general manager Pan-American M. Co., has bought a group of gold claims near Dos Cabezas.

The company running the Patagonia reduction works is buying ore and increasing its holdings. At the Poland mine, 10 miles northwest of Patagonia, a Hooper pneumatic dry concentrator is being installed. The company has let a contract for 1500 feet of development work.

YAVAPAI COUNTY.

The Dunkirk G. & S. M. Co. has organized at Prescott, general manager, A. B.

Noxon, Prescott. The company own the Dunkirk, West Dunkirk, Kentucky Judge and Keno. Considerable ore has been shipped from the property. A road is being made by the company through the camp from the Crown King stage road.

At the Henrietta mine of the Braganza G. M. Co., Big Bug, a new working shaft is being sunk and a contract has been let for a 1500-foot tunnel. The new 20-stamp mill is finished. Manager P. A. Johns has fifty men at work. The high-grade ore is shipped to the smelter on the Agua Fria, the lower grade worked in the 20-stamp mill.

The Black Hills district is attracting attention. The Iowa M. & D. Co. will work the Conger mine. The Monarch G. & C. M. Co., adjoining the Conger, is sinking a two-compartment shaft 500 feet. The Coronado G. & C. M. Co. is arranging to spend considerable money on its mines.

The Wheel of Fortune, 3 miles south of Prescott, has been secured by a company from Hartford, Conn., who expect to put a stamp mill on the property.

YUMA COUNTY.

The Bullion Bar Dredging Co. is expected to start the gold dredger of the Advance Gold Dredging Co. at the Pot-holes, 14 miles above Yuma, next month.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—The east shaft on the Kennedy has been sunk 2550 feet, with 60 feet additional for a sump. Stopping is continued between the 2100 and 2300-foot levels.

Jackson, July 6, 1902.

The Record reports at the Bunker Hill mine a vein of milling ore in the north 800 level. The new compressor to operate the pumps and power drills will be run by electricity.—Crosscutting at the Lincoln mine has begun.—At the Central Eureka forty stamps are running on good-grade ore.

The Gwin mine is adding twenty stamps—making 100 in all—new hoisting machinery and a gallows-frame 100 feet high; eighty stamps are now running.

The Argonaut mine is awaiting the verdict of the U. S. Supreme Court in the litigation between that company and the Kennedy Co. The shaft is filling with water below the 1400-foot level.

At the Sargent mine, at Middle Bar, the new hoisting works will be finished next month.

BUTTE COUNTY.

The Mercury says that the Gold Bank mine at Forbestown may soon be idle. About thirty-five men are employed at present and they are taking out ore in a few places where good milling ore is still to be had. "Prospecting has been discontinued and it is the present intention to abandon the mine as soon as the ore in sight is passed through the mill."

CALAVERAS COUNTY.

Near Mokelumne Hill, W. L. Huston is superintending development work on the Easy Bird mine, the property of the Emma M. Co.

In the 100-foot level in the Guiffra mine 25 feet more will tap the shoot; the mill will then be started. The vein gouge is 2 feet in width and carries rusty gold.

On the Sierra Railway extension the rails are laid to Carson Hill, and next month the company will be hauling freight to Angels. The road will be built to the Ghost mine.

At Campo Seco work is going ahead at the copper mine. An addition will be made to the smelting capacity and more men employed.

S. W. Payne has charge of the Esmeralda mines, near San Andreas.

The Last Chance mine at Angels has been bonded for one year to Salt Lake men for \$200,000. Work has begun.

KERN COUNTY.

The Kinyon and Wedge mines and eighteen claims, Randsburg, will be worked by the Con. M. Co. under the management of Percy McMahon.

The Randsburg Miner says the Butte lode's cleanup of eighty-one tons of ore at the mill of the Stanford M. & R. Co. resulted in three gold bars worth \$5800.

Chicago bankers have closed a contract for a block of about \$3,000,000 of the bonds of the Edison Electric Co. of Los Angeles. The Los Angeles Edison Co., in addition to building a new steam plant and enlarging its present water power plant, will install an additional water power plant on Kern river, which will be capable of developing about 20,000 H. P. This plant will be located near Bakersfield, and the power will be transmitted over a double pole to Los Angeles, a distance of about 100 miles.

KINGS COUNTY.

The pipe line of the Standard Oil Co. is laid 5 miles south of Angiola. The work is progressing at the rate of 3000 feet a day.

MADERA COUNTY.

J. P. McFarland, formerly manager and Supt. of the Alpa and Eclipse gold mines, has brought suit against J. P. Martin and J. Quadt, who are now operating the mines, to recover a third interest in the property.

MARIPOSA COUNTY.

F. P. Mills, Supt. Merced G. M. Co., of Coulterville, has men repairing ditches and flumes.

MONO COUNTY.

In the Standard Consolidated mill at Bodie for the week ending June 28, 443 tons of ore were crushed, average assay vanner tailings, \$5.52; concentrates produced, 1.42 tons; assay value, \$79.22; amalgam produced, 1645 ounces; assay value, \$2.43 per ounce. Tailings plant No. 1 treated 401 tons tailings.

NEVADA COUNTY.

Near Grass Valley, the Standard sinking goes on under the superintendence of H. Thomas.

The 20-stamp mill on the Allison Ranch mine, near Grass Valley, is to be in operation in September.

PLUMAS COUNTY.

Fifteen men are employed at the See & Jolly mine, Granite Basin.

At Rich Bar the Rich Bar M. Co. has been drifting on the bedrock; pumping machinery will be put in.

Cooley Bros. are cleaning up their gravel claim after the season's run; it is generally expected they will take out \$10,000.—Borentz and Fallet, at the mouth of Mill creek, have good pay in their gravel mine.

The Cataract G. M. & Power Co. has bought the Indian Boy mine—sixty acres along the bed of the North Fork. Supt. C. L. Adams has built a $\frac{1}{4}$ -mile ditch—5000 feet cut through solid rock; it is 5 feet deep at top, 3 feet at bottom and 2 feet deep. He will buy an elevator. The Cataract Co. also owns 240 acres covering the ancient channel on the divide between Yellow creek and the North Fork.

The Feather River Con. M. Co., with a deposit of cemented gravel, will put in a 300-ton milling plant.

SAN DIEGO COUNTY.

Mesa Grande reports that G. Lewis has sold his tourmaline mine there to McCarrroll & Ross for \$10,000.

Under the heading "A Mining Deal," the Arizona Republican says: "The plant of the California King M. Co. changed hands yesterday," but gives no particulars. The place of operations is at Pica-cho, 48 miles north of Yuma.

SANTA CLARA COUNTY.

The new furnace at the Silver Creek quicksilver mines, near Evergreen, is finished.

The Santa Teresa quicksilver mine is being reopened.

SHASTA COUNTY.

On the 9th a \$20,000 fire in the town of De Lamar consumed fifteen houses in the upper portion of the camp.

A 30 H. P. steam boiler will be put in at the Mt. Shasta mine.

The Mt. Shasta M. Co. has bonded the Phoenix mine, near Shasta, and has put men to work.

A railroad from the Southern Pacific line at the mouth of Pit river, to accommodate the business of the De Lamar smelter and other Bully Hill interests, is projected, the main line to be constructed by the Southern Pacific and Bully Hill M. & S. Co. to Copper City where its Winthrop mine is located, that it can transport the ore from this property to the smelter on its own line, as probably 80% of the freight would be hauled between that point and De Lamar.

SIERRA COUNTY.

At the Swansea mine good gravel is opened up. The mine is at Chipps Flat, 1 mile east of the Plumbago.

Nearly all the hydraulic mines near Downieville have finished the season's work.

SISKIYOU COUNTY.

At the Orcutt mine, 12 miles from Orleans Bar, a tunnel has been driven 147 feet, crosscutting three ledges.

Wood & Sheldon have bonded their copper mine near Sisson to an English company for \$100,000, with the stipulation that twelve men should do development work for a year. A cash payment of \$15,000 was made.

TUOLUMNE COUNTY.

The Stockton G. M. Co. say they have struck the old channel and find it 300 feet wide and rich.

Several carloads of pipe for the App mine have been received at Quartz.

Near Confidence, the Confidence mine has two machine drills. Twenty stamps are in operation. The cyanide plant is ready to begin; capacity, 100 tons of tailings daily; 100 men are employed.

The Contentment mine, near Columbia, is bonded for \$10,000 to C. F. Summers.—

The Lady Washington mine, near Carters, is bonded to W. H. Martin of San Francisco for \$30,000, payable before June 1, 1903.

J. S. Raggio and D. A. Lumsden have bonded to F. Chappell, Jr., the Golden Annie quartz mine, near the main Tuolumne river, with the purchase price fixed at \$2000, payable within six months.

The Morris Tunnel Co. propose to run a tunnel from the Morris Tunnel dump to the boundary line of the Bald Mt. quartz claim.

A. James has sold to C. W. Gammon of San Francisco, for \$4000, the Markham mine.

The Neale mine, Bald Mt., last week yielded \$5000 gold.

R. Stanford, Supt. Von Tromp M. Co., operating gravel and quartz claims near Columbia, is reported having left matters in bad shape, disappearing and leaving several unpaid bills for material.

The mill returns at the Keltz show that the ore mined is of good average value.

The Sonora Democrat says that, under the management of W. Rule, the Bell mine is showing good ore.—At the Dutch mine the ore shoot on the 1200 is 14 feet in width and rich in free gold and sulphurets.

The owners of the Bald Mountain pocket mine will spend \$4500 to drain the mine. They propose to extend the Morris tunnel, now in 700 feet, 475 feet farther to the east.

TRINITY COUNTY.

A 7000-pound rock crusher will be put in at the Chloride Bailey mine.

At the Fairview mine J. Potter has fifty-five men employed.

YUBA COUNTY.

Members of the U. S. Debris Commission have been at Deguerre Point and along the channel of the Yuba river to examine the site of the proposed barriers. It is expected that contracts may be let this season.

COLORADO.

BOULDER COUNTY.

(Special Correspondence).—The Logan group of mines in the Sugar Loaf district, operated by the Clinton M. & M. Co., Boulder, have produced in the past four years something over \$400,000, \$50,000 of which was extracted in free gold. The property, which is composed of ten patented claims, is operated by a series of adit tunnels. The tunnel in which they are now working is No. 4, and cuts the vein on the dip 850 feet deep. The best ore taken out of this tunnel the past month ran \$209 per ton, and the free gold ore averaged \$10 per pound. The ore shoot in No. 4 tunnel is 200 feet long, with ore in the breast and still driving the tunnel ahead. The ore carries roscoelite combined with telluride of gold and silver, which is characteristic of the ore throughout the entire property. They are employing thirty men. They have four tunnels, about 7000 feet in all. These four tunnels are equipped with ventilating shafts through to the surface. This company has not closed down a day during the past four years, with the exception of Christmas and Fourth of July. S. B. Dick of Meadville, Pa., is president.

The Chamberlain-Dillingham Ore Co. are handling about thirty tons of ore per day. Most of their ore comes from Jimtown, Gold Hill, Wall Street and Magnolia.

Boulder, July 6.

The Great Western Ex. & Red. Co. is reported unable to dispose of the output of its tungsten mines at Nederland. Last year the Railroad reduction mill at Boulder was leased and a trial run was made on thirty tons, concentrating five in one, and leave a concentrate, which was then quoted at the market price of \$130 per ton. A small quantity of the concentrates was exported to Germany; the remainder lies in the mill waiting for a market. Enough ore is blocked out in the mines at Nederland to supply the world with tungsten. A Boulder assayer and metallurgist says that if the company would put the concentrated tungsten on the market at the low price their immense deposits would warrant, that it would be used in the manufacture of the present "pipe steel."

CLEAR CREEK COUNTY.

The Golden Lily 20-stamp mill at Yankee is reported saving values on all ore handled. Assayer C. Steel gives returns of .08 and .18 as the best that has been shown in the concentrates. Assayer Valentine of Cripple Creek gave returns on concentrates sent to him from the mill of .17 and .11.

The Banty mine, Spring gulch, will be worked by the Spring Gulch G. M. Co. The shaft is down 250 feet. The ore is galena and gray copper, with values of \$50 to \$100 per ton. Manager McFarland begins shipments next month.—The Gold Cord Co. have their mill in operation on Chicago creek, treating Lexington ores.

—At the Golden Hecla Manager Boyd has sixteen men at work.—The Comstock is being worked under bond and lease by C. J. Hughes of Denver, J. S. Clark manager.—The Cripple Creek & Idaho Springs Co. own the French Flag mine and will sink the shaft to a possible depth of 1000 feet. W. J. B. Blade is Supt.—The Kelley tunnel is going ahead 8 feet per day, now in Republican mountain 600 feet.

Georgetown reports considerable good ore in sight in the Wisconsin mine. The ore body is 2 to 4 feet in width, the first class running \$150 to the ton and the second class averaging \$75.

Near Georgetown A. Z. Harman will build a cyanide mill. The company owns 500 acres of placer ground. Average tests show a value of \$10 per ton.

Geo. St. Clair, manager New Philadelphia M. Co., now has control of the Rosecrans.—The Royal Co., operating on Miller mountain, have a vein in their tunnel and will build a mill if the ore holds out. W. C. Marshall, at Empire, manager.

The parties who have been sampling the Benton have concluded to take out 1000 tons, which will be sent to the Carpenter smelter at Golden, and on the result, says the Gazette, depends the future of the Benton. The ore body is large and thousands of tons are in sight.

The Conqueror group of mines on Silver mountain has passed into the hands of Eastern men, with P. C. DuBols of Berkeley, Cal., as Supt.

H. H. Sturm, manager Republic group on Silver mountain, has twenty-six claims and 105 acres. A new mill is to be erected. The Mint group, on Covode mountain, is being operated by R. S. Grier.

Near Yankee Hill the Pioneer mill, remodeled by Brinkerhoff & Preston, is turning out values from old properties.—The Ore Verde has a tunnel in 1000 feet, with an upraise of 180 feet, where is ore on which men are drifting.—H. I. Seeman will shortly start his mill.

Near Georgetown shipments are made from the Dunderberg.—The Bisma shows ore running 58% lead and 630 ounces silver, or \$356 per ton.

One hundred and eight feet were driven at the Empire tunnel in June through extremely hard rock.

Supt. Branham of the Georgetown G. M. Co. is sinking a three-compartment shaft 4½ by 10½ feet.

W. D. Shepard, manager Western M. Co., operating the Anglo-Saxon Extension property, tells the Georgetown Courier he has permitted the bond he held for his company on the old Anglo-Saxon mine to lapse, pending the clearing of the title.

EL PASO COUNTY.

The U. S. Smelting Co., backed by the U. S. R. & R., says it will build a \$1,000,000 smelter at Colorado City to handle the bi-product of zinc-lead derived in smelting gold and silver copper ores.

FREMONT COUNTY.

Florence reports that the Bassick mine has been developed by a new shaft to a depth of 1500 feet. Good values have been found and will be shipped. The ore deposits are in shape of boulders, often coated with a layer of gold. Three of these ore channels have been disclosed in the 1500 feet of sinkings and tunnels. The channels vary in length from 30 to 110 feet and some of them have entered fully 140 feet.

At a meeting of the board of directors of the Rocky Mountain Smelting Co. of Florence, held in Chicago on the 6th, the smelter in Florence was turned over to W. K. Johnson and C. J. Seeley of Denver. Repairs will begin October 1. Mr. Johnson is general manager of the company.

GILPIN COUNTY.

The Chamberlain sampling works at Golden and Black Hawk are sampling and buying ore in carload lots for the Carpenter smelter at Golden. The ore is to be of a value of not more than \$15 per ton, and the charges \$5 50 per ton for freight and treatment, with 50 cents added for sampling. Ore carrying over 50% silica will be charged at the rate of 5 cents per unit of 50%.

GUNNISON COUNTY.

The Augusta mine, near Pittsburg, Elk Mountain district, is owned by the Augusta Metal M. Co., whose work will cut the ore bodies showing in upper workings 1600 feet deep. The company will next year build a concentrating mill. A tramway will be put in connecting the new tunnel with the mill. The present output is five tons daily shipping ore.

At Gunnison on the 4th in the drilling contest, Bailey and Henderson of Vulcan took first money by drilling 37½ inches in Gunnison granite.

HINSDALE COUNTY.

Lake City reports the Dupre Co. shipping high-grade ore from their Burrows

Park property. The California Co. is grading for a power plant at the mouth of California tunnel. The Hanna Co. has its mill and tramway completed.

P. C. Newitt has charge of the Henson Creek Lead Mines property, succeeding W. Wearne, resigned.

Manager O. W. Pierce of the Tobasco Co. has resumed work at the mine. The power plant is finished and work on the mill, tramway and dam is under way. The whole works will be ready for operation Sept. 15.

LAKE COUNTY.

In and around Leadville low-grade iron and iron, lead and zinc sulphides are produced to the amount of about 2500 tons daily, including the A. M. W., 250 tons; A. Y. & Minnie, 125; Ibox, 250; Resurrection, 150; Penn Co., 50; Home M. Co., 200; Iron Silver M. Co., 250; Yak M., M. & T. Co., 200; Small Hopes M. Co., 150; Carlhou, 100; Phoenix Co., 100; Midas Co., 200; Mikado dump, 75; Fryer hill leases, 100; Carbonate and Iron hill leases, 100; other leases, 100 tons.

The Leadville News Dispatch says in sixty days increased force will be put on the several mines mentioned at \$3 per day: Moyer 100, A. Y. & Minnie 150, A. M. W. 100, Mahala 50, Greenback 150, El Paso 300, New Monarch 200, Resurrection within the year 100, Yak 100; total new men employed 1250.

The Bimetallic smelter at Leadville will not be reopened.

The Doris Co., Iowa gulch, will decide on the 22nd inst. as to resumption of work.

Leadville reports a strike on the group south of the Continental Chief, at the head of Iowa gulch. The assays average 200 ounces silver. In the Helen Gould tunnel the vein almost covers the entire breast. Assay returns show 25% copper, 78 ounces silver, .52 ounce gold. The group consists of the Silver Cliff, Silver Chief, Horseshoe Prince and the Hill.

LARAMIE COUNTY.

Pearl reports arrangements completed whereby the Grant Copper M. Co. will secure title to 2000 feet of additional territory lying on the vein which is the chief source of the company's ore. Sinking on the ore body is being pushed. The company may co-operate with the Tully Copper M. Co. in installing a concentrating plant at the mine.

MONTEZUMA COUNTY.

Near Mancos, on the Doyle properties, five contracts on adits are under way. The company is paying over \$1000 per month, exclusive of contracts. Supt. Toll has the mine tracks laid and much of the machinery in place.

OURAY COUNTY.

At Ouray F. J. Hulaniski has made final payment on seventeen gold claims adjoining the Camp Bird, Revenue and Virginian companies, and has sold the properties to the San Pedro G. M. Co., which proposes to build a mill thereon.

W. R. Kramer, of the Governor, Sneffels district, says his company will build a 10-stamp mill.

PITKIN COUNTY.

Aspen reports Roaring Fork properties promising favorable results. A new shaft is going down at the Keystone. The Percy Consolidated is worked through the Newman tunnel. In the La Salle claim of this property, which joins the Keystone on the south, there is reported to be ore which runs 75 ounces in silver and 25% lead. Manager G. Newman is employing a large force of men.

SAN JUAN COUNTY.

J. W. Dodds, manager Poverty Gulch M. Co., is working two shifts on six claims in Porphyry gulch, near Chattanooga.

The Early Bird property, near Mineral Point, has a 240-foot tunnel on the vein. Twelve cars of ore shipped therefrom netted the owners \$6500. The ore ran three ounces gold, 150 ounces silver and 6% copper to the ton.

SAN MIGUEL COUNTY.

At Telluride the Pennsylvania tunnel is being pushed to the Sheridan. The ore from the Smuggler-Union mine will be brought through the tunnel to be sent to the mills at Pandora. At the mine 450 tons are daily sent to the mills. The company has 350 men on the payroll at the Bullion tunnel, 80 at the Contention mine in Bear Creek basin, and 100 are employed at the mills at Pandora.

Vanadium steel is reported introduced in France by A. B. Frenzel of Telluride. Considerable deposits of vanadium ores have been found in San Miguel county. Recent researches have shown that a small percentage of vanadium will increase the tensile strength of steel 100%. The Creusot works of Schneider & Co. are reported experimenting with the new material.

At Telluride the Alta mill is treating seventy-five tons of ore per day, which makes on an average thirty-five tons of concentrates, of a value, after the expense

of shipping and smelting are deducted, of \$35 a ton.

Men are employed at the Pennsylvania tunnel and where the Sheridan vein is intersected. A force will be put to work on development and a raise driven to connect the Pennsylvania with the Bullion tunnel. After the intersection of the Sheridan the tunnel will be extended to cut the other veins that form the Smuggler-Union group.

SUMMIT COUNTY.

The French Gulch G. P. Co. and the American G. D. Co., Swan valley, have good placer gold output.

The Gold Pan hydraulic elevator pit, Blue river, Breckenridge, is 50 feet deep. The tallings have accumulated in the Blue river. Work is being pushed on the rubber belt conveyor to take tallings from the end of the flume up an incline over the track of the Colorado & Southern railway's South Park branch.

Manager J. A. Bush has resumed work on the Mount Gilead and the Glen-Mohawk groups.

TELLER COUNTY.

A reduction of smelting charges of non-contract ores in the Cripple Creek smelters from \$1 to 50 cents has been made. In smelting contract ores the smelter knows exactly what it has to handle and can make better rates. With non-contract ores it does not. The reduction will be of benefit to owners of low-grade mines. The new rate went into effect July 10, and will be \$7.50 per ton instead of \$8.

The cyanide mill on the Ironclad mine, Ironclad hill, is in operation. It is owned by A. H. Heller and A. L. Steward.

Cripple Creek district produced during June 50,700 tons of ore, gross bullion value, \$1,866,000. The new mill of the Portland company and the Telluride plant at Colorado City figure in the above. Both plants have been in a measure experimenting and low-grade ores have been treated at both, to fill up leakages and get the machinery in regular running order. Next month the Republican thinks these plants will show an increase in tonnage and the grade of ore treated will be improved.

The June production of ore treated by the Economic mill at Cripple Creek was 4620 tons, average value \$33 50 a ton.

The Isabella G. M. Co. has a contract with the Pike's Peak Power Company for a 30-H. P. hoist to be placed on the Emma.

Cripple Creek's production for June was:

Plant.	Ton-nage.	Av. Value.	Gross Value.
U. S. R. & R.....	19,000	\$29	\$551,000
Union.....	12,000	30	360,000
Economic.....	3,200	30	96,000
Telluride.....	1,500	30	45,000
Eureka.....	1,500	10	15,000
Dorcas.....	1,500	25	37,500
Smelters.....	12,000	63	756,000
Totals.....	50,700		\$1,866,000

At Cripple Creek the sheriff has sold the properties of the Rebekah G. M. Co. to M. B. Carpenter, of Denver, for \$97,000. Mr. Carpenter represented the creditors, who held a judgment of \$76,437.68 against the mine, exclusive of the surface improvements and machinery.

President Roosevelt, Attorney-General Knox and Secretary of the Interior Hitchcock have refused to reopen the Hull City placer claims against the patentees of the placer. J. A. Owenby, of Denver, who claimed an original interest in the placer location, interviewed the President several weeks ago and laid before him data tending to establish his claim. The whole matter was gone into in detail by our Cripple Creek special correspondent in last week's issue.

IDAHO.

IDAHO COUNTY.

Welser is sending some statements made by recent arrivals from Thunder Mountain that are apparently more for boom purposes than as actual facts. Ore samples for which \$100 were refused, ledges of ore 12 feet wide, running \$2000 gold to the ton, and placer claims yielding \$20 per day per man, may do for advertisements in Boston and St. Louis papers, but will not fool many miners. Here is a further specimen: "Mr. Haggerty is an experienced miner and gives it as his opinion that in three years Thunder Mountain will prove to be the greatest mining camp in America. He says the Dewey is a greater mine than the famous Treadwell in Alaska. Almost every known mineral is found in the camp. He reports H. E. Taylor having discovered a large body of platinum, the location of which he will not disclose." Very likely he will not; platinum in place is too rare a thing to be "disclosed." The truth is good enough, and no good purpose is served by such manifest exaggerations.

The Salt Lake Tribune avers that the hanging up of the White Knob Co.'s mines and smelter at Mackay is the out-

growth of troubles in the family, and that as soon as these are adjusted the order to resume will be forwarded. It is claimed that the physical condition of the properties was never as good as it is at present, and that recent reports concerning high-grade disclosures on the 800-foot level were without exaggeration.

At Buffalo Hump the Crackerjack's new mill is in operation and is expected to pay dividends at the end of each thirty days' run. The mine is opened to a depth of 150 feet; there is in sight ore blocked out. A lower tunnel will be started to give the mine 150 feet additional depth. W. A. Stevens has put up the money for development, construction of mill, building of roads, etc., and for a one-third interest in the property.

The Jumbo and its four stamps are producing \$5500 per month. The owners will increase the stamps to ten.

L. McAtee will put a small stamp mill on his property near the town of Hump.

OWYHEE COUNTY.

The Avalanche says Slaker tunnel is a success. The War Eagle Con. M. Co. have a ledge of ore that will run \$20 gold uncovered in the south drift, 5 feet wide, 3 miles east of Silver City.

SHOSHONE COUNTY.

The Morning mill at Mullan is building an extra vanner room to work over tallings which are now shipped out and used as railroad ballast.

WASHINGTON COUNTY.

E. D. Ford, manager Salzer-Ford properties, Black Lake, Rapid River district, has men opening the road that machinery can be taken in.

Talking of Thunder Mountain's prospects, H. B. Brown thinks mining companies will not employ many miners until transportation shall be opened to a point where the food and supplies can be gotten cheaply. Under the present charges for taking freight into the camp it means an expenditure of \$5 a day to hire and feed a miner. In a low-grade camp such as Thunder Mountain proves to be, it is not wise to do extensive mining when the costs are so high. He thinks there are about 100 men at work at the mines in the camp.

Stewart & Myers, owners of the Silver King mine at Warren, will put a 10-stamp mill on their property. A 300-foot tunnel, with a 6-foot ledge of ore, is on the property. Another tunnel will tap the ledge at a depth of 1300 feet.

MISSOURI.

HOWELL COUNTY.

The works of the Renfrew Zinc Oxide Co., of West Plains, and the Alice mine at Weatherhill are sold to the Empire Zinc Co. of Joplin for \$200,000. The Joplin Co. is a branch of the New Jersey Co., the zinc oxide trust.

JASPER COUNTY.

Joplin reports total sales for the six months of 1902 ending June 30 aggregated 138,007 tons of zinc and 16,051 tons of lead, an average of 5231 tons of zinc and 618 tons of lead per week, and the average weekly value was \$175,590.

The zinc sales were 2312 tons of zinc more and 938 tons of lead less than the first six months of 1901. The value is \$547,857 more.

There was an increase of ore sold of 322 tons of zinc and 17,000 pounds of lead over the preceding week.

The turn-in by camp was as follows:

	Zinc.	Lead.	Value.
Joplin....	2,611,840	309,200	\$50,361

MICHIGAN.

HOUGHTON COUNTY.

An electrical engine, Saginaw, will furnish the power for the six heads of stamps in the addition to the Hecla mill of the Calumet & Hecla. It is the only engine of its kind in the copper country.

MONTANA.

B. H. Tatem, assayer in charge of U. Assay Office at Helena, reports the value of metals produced in Montana during 1901 to be \$60,387,619.01. The sums of the gold, silver, copper and lead was distributed as shown in the following table:

Metals.	Quantity.	Value.
Gold, fine ozs.	232,331.454	\$ 4,802,717.39
Silver, fine ozs		
(coining rate).....	14,180,545 19	18,334,442 26
Copper, fine lbs @ \$16 117		
per cwt.....	228,031,503	36,751,837.34
Lead, fine lbs.		
@ \$4.334 per cwt.....	11,304,892	498,662.01
Total.....		\$60,387,619.01

The gold product of 1901 originated from the sources shown below:

Classed as	Fine ozs.	Value.
Placer hullion.....	25,285 602	\$ 522 699.78
Mill hullion.....	72 961 647	1,509 251.10
Cyanides.....	57,013 558	1,178,574.84
From copper ores.....	45,850 574	947,815 48
From lead ores.....	6,479 641	133 946 07
From smelting ores.....	24 740.432	511,436 12
Total.....	232,331.454	\$4,802,717 39

FERGUS COUNTY.

Capt. Emerson, E. R. Beatty and W. G. Moore are inspecting the property of the Montana Texas & Colorado Co. at Kendall, 100 miles east of Butte. The rock is an altered lime, carrying values of \$8 up to \$10 a ton, and is amenable to cyaniding. The company will exploit the ore showing at hand and later build its own reduction plant.

GRANITE COUNTY.

J. H. Hand of the Crescent Mining Co. is making an inspection of the company's properties on Stony creek.

C. N. Chapin is manager of the Montana G. M. Co. at Princeton.

G. Weaver is assistant superintendent Good Hope mine.

Supt. J. Schneider, near Phillipshurg, will put the Dorothy G. M. Co.'s claims in Boulder district in shape for a new reduction plant, capacity 200 tons per day. The milling ore runs \$22.50 to the ton.

LEWIS AND CLARKE COUNTY.

Nearly all the old employees of the American S. & R. Co.'s plant at East

Helena have signed an agreement with the company. The smelter will reopen next week.

Helena reports the Farmer lode ore body 7 feet wide.

Fifty men are employed at the Big Indian property, constructing the 60-stamp mill.

The Ellison & Southern Railroad, a branch of the Northern Pacific, is to be extended to a point within 2 miles of the Beatrice mine.

MADISON COUNTY.

McFadden, Irving & Drackert have \$867 net from a shipment of ten tons of gold ore made from Pony. So far this year they have made \$6,000 out of the property they are working under lease.

Returns on shipments of concentrates made from the Carmin mill near Pony from the Oregon mine, 25 tons second-class, gave a saving of 71%. The shipment netted \$700.

MISSOULA COUNTY.

The Silver Bell mining property, west end of Missoula county, 12 miles from Eddy, is sold for \$25,000 to Dr. W. F. Robinson of Missoula.

PARK COUNTY.

At Livingston the Yellowstone M. Co. has incorporated to work the Venus, Jupiter, Saturn, Mars, Eureka, Albany, Climax, Climax Extension, Savage, Long Chance, Morgan and Troy quartz claims.

SILVER BOW COUNTY.

The receiver for the Snohomish and Tramway mines shows that during May the Snohomish yielded 573 tons first-class ore and some second class. The Tramway yielded sixty-two tons of first class.

Magnolia M. Co., Mono M. Co., Boston De Lamar M. Co., and other adjoining claims, comprising about 1600 acres of gold-bearing property, covering the vein for a distance of 3 miles.

LYON COUNTY.

The Gold Canyon Tunnel Extension Co. is having a contract signed by the mine owners of Silver City by F. Leonard, Jr., to secure drainage of their mines. There has been spent by different companies for pumping more than enough to have met the cost of a drainage tunnel. The terms are: A royalty averaging 10% of the production will be paid the tunnel company when the tunnel reaches a point within 500 feet of any of the mines or mining claims, or when the mines are drained within 2000 feet. All waste rock may be transported through the tunnel at a cost of 10 cents per ton per mile, but mine owners having shafts may hoist their ore and waste if more convenient. All ore or waste excavated in running the tunnel will belong to the tunnel company. The tunnel company has the option to mill ores at the rate of \$2.50 per ton for concentration and \$3 per ton for crushing and cyaniding. All parties owning mills are excepted and not affected by this clause. In case mine owners do not work their claims for a period of four months, the Gold Canyon Co. may operate for the account of the owner, paying to the owner 50% of the proceeds. Wherever ore is found in any mine the owner has the right to take possession immediately and work the mine, paying the agreed royalty and the actual disbursements incurred by the tunnel company for development work in that mine. The Comstock Tunnel Co. offers to do its work at cost.

NYE COUNTY.

C. E. Knox, manager Mizpah Extension Company's property at Tonopah, says there are seventy-five wagons plying between the camp and the loading stations at Sodaville and Candelaria with ore, at these points the platforms are breaking under a tonnage which is waiting on rolling stock for its removal to the main line of the Southern Pacific. Some of these wagons are drawn by six animals, others with trailers are drawn by as many as twenty-two. He said \$4 a day awaited experienced miners and work also for a few carpenters and timbermen.

The Salt Lake Exchange will list Tonopah stocks.

The Bonanza says twenty first-class miners can find employment in Tonopah.

STOREY COUNTY.

The 4-inch casing for the Davis drill has arrived at Virginia, at the drilling plant on Brunswick-Potosi. Superintendent Gibson will resume work with a 3-inch drill.

The Virginia Miners' Union celebrated its thirty-fifth anniversary July 4th.

The Savage mine reports: We have opened the seventh floor in the upraise above the north drift from No. 2 east crosscut and have stope the south one set on the sixth floor. The fillings at this point show a slight improvement in grade. Have saved for the week twenty-three mining carloads of ore, the car sample of which assayed \$13.78 per ton. This ore has been placed in the bins at the Best & Belcher mill, which will be started shortly on the accumulated ore.

WHITE PINE COUNTY.

W. T. Hook, manager New York & Nevada C. M. Co. at Ely, projects the purchase of a 500-ton smelter.

C. M. Spence, of Jasper, manager Black Forest M. & S. Co., will put in a 30-ton smelter.

Manager C. P. Weber, of the Sapho Mining Co., says a concentrator of 100 tons daily capacity will be built at Keystone, 3 miles distant from the mines of the New York & Nevada Co.

NEW MEXICO.

BERNALLILLO COUNTY.

W. R. Uttley will build a 150-ton smelter at Algodones.

GRANT COUNTY.

J. L. Schofield & Co. have been running steadily since January on the tailings at the old Bell & Stephens mill, Pinos Altos. The tailings are fed into an amalgamating pan having a continuous discharge onto plates. After leaving the plates they go through an amalgam trap into the concentrator, which in this case is a large rocker, 4x12 feet, driven by power. About 65% of the values recovered are caught in the pan and on the plates, the balance in the concentrates. The saving averages 90%.

OREGON.

BAKER COUNTY.

Near Baker City E. Everett, manager Uncle Dan G. M. Co., is doing experimental work.

A deal is reported pending for the

E & E, which has twenty stamps. The Magnolia is expected to open with ten stamps. The Quebec has ordered ten more stamps and the Prairie Diggings will add twenty-five to the present battery. The North Pole has commenced work on twenty, which will make the total for that property thirty.

Near Sumpter the following are in present operation:

	Rolls,	Tons. Stamps.
Golconda.....	100	20
Bonanza.....		40
Badger.....	100	20
Columbia.....		20
Red Boy.....		20

Don Juan.....		10
Mammoth, mill.....	40	
Quebec.....		10
Pyx, or Phoenix.....		10
Prairie Diggings.....		25
Cougar, cyanide.....	250	
Black Hawk.....		5
Virtue.....		20
Flagstaff.....		20
Cornucopia.....		20
Perry.....		10
Connor Creek.....		35
Gem.....		10
Sanger.....		20
Balsley Elkhorn.....	50	
Gold Hill.....		10

The Red Boy proposes to sink 1000 feet deeper.

Cable Cove reports that at the Baby McKee an 1800-foot tunnel is being driven by Manager Townsend at a depth of 3000 feet below the apex, that crosscuts may be run each way. J. T. Temple will work the Alpine group at the same level.

The Imperial projects a 3000-foot tunnel at the base of the mountain.

Supt. McGhan has twenty-five men working underground at the Virtue mine and is running fifteen stamps on good ore.

LANE COUNTY.

C. Harding of Eugene, who owns the Treasure claim in the Blue River district, says he will build a 20-stamp mill on the property.

MALHEUR COUNTY.

At Malheur the Red, White & Blue mine is sold to Eastern men by Mrs. M. Richardson for \$20,000—\$7500 down.

The Sunset M. Co., on the Malheur river, reports 2 feet wide of milling ore that assays \$25 per ton.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Supt. Frazier of the Alder Creek M. Co. as the result of a twenty-eight days' run has a brick valued at \$10,000.

The Pluma M. & M. Co. will start their mill July 28

The Belt Development Co. is working on its property in South Lead, getting ready to sink 500 feet farther. O. B. Amsden is general superintendent. C. L. Amsden is in charge of work at the mine.

The Butte, Mont. Miners' Union has loaned the Lead Union \$20,000. The Terrapeak Miners' Union has also advanced \$6500 and a joint mortgage on the property of the Lead City Union is taken by the Butte and Terrapeak Unions.

Lead City has two 200 stamp mills, one 160-stamp mill, one 180-stamp mill and two cyanide mills. The ore runs from \$14 to \$17 a ton. The deepest mine is down 1100 feet.

The Gold Reward smelter and cyanide mill at Deadwood is treating 600 tons per day; 400 tons at the smelter and 200 tons at the cyanide plant.

The Dakota M. & M. Co. is operating a 30-stamp wet crushing cyanide mill at Deadwood on ore from its mines in the Portland district at Bald Mountain. The cost of treatment at this mill is \$1.34 per ton.

PENNINGTON COUNTY.

The National smelter at Rapid City is treating 200 tons of ore daily.

YANKTON COUNTY.

The new cyanide mill in course of erection by the Homestake Co. at Gayville, for the treatment of tailings from the Father De Smet, Caledonia and Deadwood-Terra mills is nearing completion. The plant will have a daily capacity of 800 tons.

UTAH.

Utah's metal production for 1901 was as follows:

	Quantity.	Value.
Gold, fine ozs.....	184 803	\$ 3 820,216
Silver, fine ozs.....	11,319 860	14,635,779
Copper, fine lbs.....	26,931,888	4,340,612
Lead, fine lbs.....	99,102,516	4,295,103
Total.....		\$27,091,710

The value of the gold, silver, copper and lead produced by the mines of the State of Utah in 1901 was \$27,091,709.75, having

been the largest in the history of the State, and a gain of more than \$4,000,000 over the year 1900, which had previously shown the greatest yield.

The quantity and value of each metal produced in 1901, the value of the gold and silver being computed at the coinage rate and that of the copper and lead at the average market price for the year, is shown in the table which follows, together with corresponding figures for 1900, so that the changes may readily be noted.

It may be noted that the not increase amounts to .9%. The increase of silver came from the Park City district, while the production of copper increased in all of the mining districts of the State, but more especially in that of Bingham. The decrease in gold was comparatively small. The location of this decrease was in the Tintic and Mercur districts and due to various local causes. All other districts of the State show a gain in the amount of gold won, the most noteworthy being Kimberley, where the Annie Laurie mine is located. The Bingham district also shows a very creditable increase in its production of gold.

The quantity and value of the gold from the different classes of ore in 1901 is shown in the following table:

Classed as	1901— Fine ozs.	Value.
In quartz and dry ores....	6,688,150	\$ 138,256.32
In cyanide mill bullion.....	98,793.489	2,042,242.66
In lead ores....	17,724.888	366,405.96
In copper ores....	43,521.388	899,666.94
In milling ores....	18,075.018	373,643.78
Total.....	184,802.933	\$3,820,215.66

The mining of silver in Utah is done largely in connection with ores carrying lead and other metals, where the values have principally been in silver. The mining of such ores was curtailed by the decline in the price of silver that occurred in 1901. In the table given below the origin of silver from the several branches of mining for the past two years, and such changes as occurred therein, are noted:

Classed as	1901— Fine ozs.	Coin'g value.
In quartz and dry ores....	850,266.61	\$1,099,334.65
In cyanide mill bullion....	48,213.26	62,336.34
In lead ores....	7,357,481.54	9,512,703.35
In copper ores....	2,201,143.66	2,845,923.11
In mill'g ores....	862,755.00	1,115,481.21
Total.....	11,319,866.07	\$14,635,778.66

Two-thirds of the entire silver yield of the State originated in ores carrying lead, thus giving an importance to this class of mining greater than attaches to the others.

The yield of gold in 1901 as distributed to the counties of the State is noted in the following table:

Counties.	1901— Fine ozs.	Value.
Beaver.....	1,003.718	\$ 20,748.69
Iron.....		
Juab.....	40,158.989	830,159.99
Piute.....	18,008.721	372,252.63
Salt Lake.....	27,911.565	576,983.25
Summit.....	13,731.376	283,852.73
Tooele.....	80,978.768	1,673,979.70
Utah.....	120.000	2,480.62
Wasatch.....	339.729	7,022.82
Impossible to classify.....	2,551.067	52,735.23
Total.....	184,802.933	\$3,820,215.66

BEAVER COUNTY.

Near Frisco the Horn Silver mill is closed down, owing to a lack of water. Underground work is reduced pending negotiations between the management and the smelter company over a working charge at the latter's furnaces. Developments at the Cactus and the results of experiments at the concentrator have created interest in that property.

EMERY COUNTY.

Price alleges an offer of \$10,000 has been made to the locators of the uranium deposit, Green River.

JUAB COUNTY.

It is locally stated that the management of the Grand Central of Tintic has assurance from the Oregon Short Line that its Tintic branch will be extended to the dump, that the loading of ores direct upon the cars may begin next month, and that nearly 70,000 tons has been guaranteed by the Bingham Con. smelter management. For the hauling, the railway, under the revised tariff, receives \$1.50 per ton.

All operations at the Swansea of Silver City, which has \$300,000 dividends to its credit, are indefinitely suspended. Manager Geddes says the cause is the decline and depression in the silver market and advance in the price of supplies of every description, from candles to drills. He says there are 125,000 tons of ore exposed.

SALT LAKE COUNTY.

The Rio Grande Western railway made a flat rate of 75 cents a ton, regardless of the quantity or quality of ore, in carload lots from Bingham to the valley smelters. The new rate effects a saving to the producer of 50 cents a ton, or about \$15 a carload, the previous rate having been \$1.25 per ton. When the company first extended its tracks into Bingham the rate on ore was \$2.25 per ton, and that charge has been gradually reduced to 75 cents.

The Highland Boy Con. M. Co. has prepared its complaint, and apex proceedings are lodged against the Petro. The Highland Boy's smelter furnaces in June produced 1,141,520 pounds of pig copper, carrying gold and silver.

The new million-dollar smelter of the American S. & R. Co. is in commission. The plant has eight, each capable of handling 125 tons per day. The old Germania smelter will continue in service until the new attains its complete capacity, and will then be converted into other uses.

Supt. T. G. Cole of the Ben Butler, Bingham, last week shipped two carloads of ore carrying lead, with some gold and silver, and has extracted 100 tons of milling ore for the Dewey mill, in Bingham canyon. He has four faces of ore on which to work.

SUMMIT COUNTY.

Near Park City, the Silver King mill started up its entire plant, new slime rooms, dryer, etc.—The Thayne's Canyon Con. Co. will sink a vertical shaft on their property.—Mayne & Co., on the Perry group, will continue sinking the shaft to contact.

WASHINGTON.

COWLITZ COUNTY.

At Kalama, the Darnell M. & M. Co. will build a fifty-ton cyanide plant. The plant will consist of a 50 H. P. engine, hoiler, rock crusher, ore mill, four cyanide tanks, dynamo for electric lights. The Red Star M. Co. has a 6-foot ledge of quartz carrying gold and chnabar. The tunnel on the Copper Dyke is showing ore, carrying copper 2%, gold \$1. Two other ledges have been discovered on the property, carrying gold on the surface \$2.80 and \$2.65 each.

FERRY COUNTY.

Republic reports that the manager of the Wauconda mine has suspended work. It is locally stated that Rossman, Edwards & Co. want to lease the mine for a period of years and would erect a plant of 500 tons daily capacity.

PIERCE COUNTY.

J. T. Davis of Tacoma has sold to an Eastern company for \$50,000 control of an arsenic mine on Mineral creek, 50 miles southeast of Tacoma. The mines have been developed with 1400 feet of shafting and tunneling, 5 miles of wagon road, a saw mill, electric plant and hoisting machinery. A tramway 1500 feet long is being constructed. The purchasers will have the reduction works completed in September, involving the installation of machinery. The product will be sulphide of arsenic and oxide of arsenic.

STEVENS COUNTY.

Marcus reports a strike on No. 2 vein of the Little Monster. According to a reported test made by the Northport smelter, the ore runs half an ounce gold, 286 ounces silver and 9% lead. The owner, L. R. Phillips of Marcus, says ore is stored for shipment.

YAKIMA COUNTY.

At North Yakima F. H. Nagler, secretary Elizabeth M. Co., says he has assays showing the Elizabeth ore to contain \$335 gold, \$12 silver and \$1.68 copper.

FOREIGN.

BRITISH COLUMBIA.

Rossland reports a serious shortage of cars which curtailed shipments of ore last week. The Le Roi sent out 2350 tons; the Le Roi No. 2, 1250; Giant, 120 and War Eagle, 90; total for week, 3810 tons; for year to date, 165,646 tons. The scarcity of coal, owing to the miners' strike at Fernie, has inconvenienced the mines. The Le Roi mine is using wood in its compressor, the War Eagle and Centre Star are importing Rosslan coal, while the Le Roi No. 2 and affiliated properties are independent of the coal supply, as they use compressed air generated by electricity.

On the 4th inst. a meeting of the Le Roi M. Co. was held in London. A proposal was laid before the shareholders to assess the stock 10 shillings per share, but the motion to that effect was defeated. The adoption of the proposal would have involved a reorganization of the company; its defeat means that for the present there will be no reorganization.

The B. C. Coal Co. of Nelson will use a diamond drill outfit in prospecting the company's coal area on the North Fork of Kettle river, 60 miles north of Grand Forks. It is proposed to prospect the ground to a depth of 500 feet.

MEXICO.

Monterey reports that the Guggenheim interests have acquired the Tiro General mine, Charcos district, near San Luis Potosi, for \$450,000. The property is silver and lead producing.

OAXACA.

There are several United States corporations operating in the district of Ocotlan; two are St. Louis corporations, one a Pittsburg and one from Oregon. The Carpintero is sold for \$40,000 to the Compania Minera Cuauhtemo, to be developed under modern methods. Hamilton, Wiltsee and Jackson are interested in Ocotlan district.

SINALOA.

R. A. Thomas, representing Los Angeles men, has bought the Reforma group of mines. These mines are situated near La Junta, on the line of the Kansas City, Mexico & Orient railway.

Personal.

H. HOLMAN is Supt. Desert King M. Co., Wedekind, Nevada.

S. E. BRETHERTON of Val Verde, Ariz., is visiting San Francisco.

E. E. CHASE has returned from Park City, Utah, to Denver, Colo.

DUDLEY GRAY is manager U. S. & R. Co.'s plant, Canyon City, Colo.

G. MCM. ROSS has returned to Virginia, Nev., from San Francisco.

PHILLIP ARGALL has returned to Denver, Colo., from a trip to Arizona.

S. W. TYLER of Denver, Colo., is examining property at Bingham, Utah.

G. W. HULL is general manager Sullivan M. & S. Co., Cranbrook, B. C.

SUPT. KIRBY of the Daly-West, Utah, mine, has withdrawn his resignation.

JNO. H. STEPHENS is assayer at the Rawhide mine, Tuolumne county, Cal.

J. M. McLAREN has been appointed mining adviser to the Indian government.

JNO. CLAGGETT is superintendent the Pride of the West, Washington, Arizona.

J. J. BROUGHALL will take charge Aug. 1 of the Daly-Judge concentrator, Tintic, Utah.

G. H. JOHNSON of Philadelphia, Pa., is in Denver, Colo., looking after his mining interests.

F. H. BOSTWICK, of the Hendrie & Bolthoff Mfg. Co., Denver, Colo., is in San Francisco.

F. E. SCHWARZ of Denver is in Park county, Colo., inspecting some mining properties.

A. P. GRIFFITHS has been appointed general manager Palmarejo & Mexican Gold Fields Co.

V. G. HILLS, M. E., has returned from Santa Maria del Oro, Durango, Mexico, to Cripple Creek, Colo.

M. F. PERRY, general manager Minas Prietas Reduction Co., Sonora, Mexico, is in Virginia, Nevada.

R. A. TREVARTHEN has returned to Cripple Creek, Colo., to assume charge of the Midget, on Gold hill.

W. D. PINKSTON has charge of the Alameda G. M. Co.'s operations near Westville, Placer county, Cal.

W. P. KINNEY has been elected secretary and treasurer Colorado Springs, Colo., Mining Stock Association.

ASST. SUPT. J. SHIELDS of the Tamarack and Osceola mines has succeeded C. Bedell as Supt. Quincy mine, Houghton, Mich.

J. A. UNDERWOOD, superintendent of the Clarissa, and one of the lessees of the Sioux-Utah at Tintic, Utah, has returned from New York.

F. M. DRESCHER, E. M., has returned to Denver from Terco, Colo., where he has been for the Colorado Fuel & Iron Co., working on their coking plant.

RALPH NICHOLS, general manager Great Boulder Perseverance Co.'s gold mines at Kalgoolie, West Australia, is in San Francisco, Cal., en route home.

T. J. GREENWAY, formerly manager Broken Hill South M. Co. and the Broken Hill Block 14 Co., has been appointed manager mines of the New Chillingoe R. & M. Co., Australia.

H. A. CULLOM has charge of three stamp mills near Hailey, Idaho, and is now in Shoshone, Idaho, to start up a fourth one belonging to the company owning the other three.

DANIEL McDONALD, president of the American Labor Union, has returned to Butte, Mont., after several weeks in Denver, Colo., where he gained his new title. Mr. McDonald was formerly president of Western Labor Union.

DR. A. J. CHANDLER, of Mesa, Ariz., has gone to Europe to interest capital in an enterprise for the construction of a water power electric plant on Kanabwash,

60 miles from Williams, near its junction with the Colorado river.

W. J. HOWARD, 3226 Champa St., Denver, Colo., has been engaged by a London mining corporation as general superintendent of their properties in South Africa, India and West Africa, being in the latter section at present in charge of the properties of the Wassau Gold Coast M. Co., Ltd., of London, at an annual salary of \$15,000.

P. M. NEWHALL of the University of California, goes to South Africa as mine surveyor in the Witwatersrand Deep at Germistown. H. W. Pudan, a California University graduate, goes to Johannesburg to take a position there as mining engineer. C. H. Aspland of the California University, goes to Germistown, South Africa, to take a position as sampler in the mines.

ROBERT MCF. DOBLE, C. E., of San Francisco, is in the East for the purpose of placing the orders for the machinery and other material required for the construction of the 110-mile hydro-electric power transmission of the Guanajuato Power & Electric Co., in Mexico, for which company he is consulting and supervising engineer. Power is to be supplied to the silver mines at Guanajuato, Mexico.

Commercial Paragraphs.

THE Rand Drill Co. has established a Salt Lake, Utah, office in charge of G. W. Topliff, Commercial Club Building.

THE San Francisco office of the Westinghouse Electric & Mfg. Co. has been moved from the Mills Building to 425 Market St.

THE American Steel & Wire Co., Chicago, report the receipt of ten gold, four silver and four bronze medals at the South Carolina Inter-State & West Indian Exposition, which closed May 31, these medals representing the highest awards in each class.

THE Joshua Hendy Machine Works, San Francisco, Cal., have installed a complete electrical plant for the Duplex M. Co. at Searchlight, Nev., with sufficient capacity for lighting, drilling and pumping purposes. They have also furnished a large double-cylinder, double-drum hoisting plant to the Tyee mine on Vancouver island, B. C. The Willamette Pulp & Paper Co. have ordered from the Joshua Hendy Machine Works a large size rock crusher for their manufactory at Oregon City, Or.

THE Central California Electric Co. has recently purchased two 1000 K.W. Westinghouse alternating current generators, which will be direct connected to water wheels and used to supply power to Grass Valley, Nevada City, Sacramento and adjacent California towns. This is the third station to be installed by the company, two other stations having now been in operation for a number of years. The Central California Electric Co.'s system is a part of that of the South Yuba Water Co., which controls 400 miles of main ditch line in the Sierra Nevadas.

THE Crocker-Wheeler Co. of Ampere, N. J., manufacturers of direct current machinery, have included the following among recent orders: Standard Steel Works, Burnham, Pa., two, size 224, 200 K.W. generators; James Cooper Mfg. Co., Montreal, Canada, 55 K.W. generator; Buda Foundry & Mfg. Co., Harvey, Ill., size 280, 240 K.W. generator; Whitehall Portland Cement Co., Cementon, Pa., 85 H. P. motor; Woodward & Lothrop, Washington, D. C., size 224, 200 K.W. generator; two, size 168, 150 K.W. generators; size 84, 75 K.W. generator; Sparrell Print, Boston, Mass., fourteen motors, 3 to 10 H. P.; Tidewater Steel Co., Chester, Pa., size 280, 250 K.W. generator; Minot Light & Telephone Co., Minot, N. D., size 100-D, 90 K.W. generator; Armour & Co., East St. Louis, Ill., four 50 H. P. motors; one 75 H. P. motor; Green Engine & Machine Co., Harrison, N. J., four 35 H. P. motors; Descubridora Mining & Smelting Co., Mexico, four 20 H. P. motors; Moline Malleable Iron Co., St. Charles, Ill., size 100-D, 95 K.W. generator; eleven motors aggregating 125 H. P.; Pennsylvania Sugar Refinery, Philadelphia, Pa., fourteen motors, 3 to 15 H. P.; Fretz Umbrella Works, Philadelphia, Pa., eighty motors in small sizes; Lake Shore & Michigan Southern Shops, Collinwood, Ohio, eleven motors aggregating 200 H. P. were shipped to apply on the installation in this plant; speed control will be obtained by the Crocker-Wheeler system of multiple-voltage operation.

Recently Declared Mining Dividends.

Daly-West, Utah, \$108,000.....	July 15
Mary McKinney G. M. Co., Colorado, \$30,000.....	July 15
Ontario, Utah, \$45,000.....	Sept. 20

Payable.

Latest Market Reports.

SAN FRANCISCO, July 11, 1902.

METALS.

SILVER.—Per oz., Troy: London, 24½d (standard ounce, 925 fine); New York, bar silver, 52½c, refined (1000 fine); San Francisco, 52½c; Mexican dollars, 44½c San Francisco, 42c New York.

COPPER.—New York: Standard, \$11.37@11.75; Lake, 1 to 3 casks, \$11.95; carload lots, \$12.15; Electrolytic, 1 to 3 casks, \$11.95; carload lots, \$11.60; Casting, 1 to 3 casks, \$11.75; carload lots, \$11.50. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £52 17s 6d spot, per ton.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.60; St. Louis, \$4.00; San Francisco, \$4.50, carload lots, 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½; pig, \$4.75. London: £11 6s 3d per ton.

SPELTER.—New York, \$5.00; St. Louis, \$4.50; London, \$19 per ton; San Francisco, ton lots, 5½c; 100-lb lots, 6½c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$28.50; San Francisco, ton lots, 31½c; 1000 lbs., 31½c; 500 lbs., 31½c; 200 lbs., 32c; less, 32½c; bar tin, 3½, 37c. London, £126 15s spot.

PLATINUM.—San Francisco, crude, \$17.50 ½ oz.; New York, \$19.50 per Troy oz.

QUICKSILVER.—New York, \$48.00 large lots; London, £8 15s; San Francisco, local, \$46.00 ½ flask of 76½ lbs.; Denver, \$50.00. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER.—Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100-lb. lots, 16½c.

NICKEL.—New York, 50@60c ½ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$21.50; gray forge, \$21.00; San Francisco, bar, 3c ½ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$33 and \$34; open hearth billets, \$35.25; San Francisco, bar, 7c to 12c per lb.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15c. No. 1** 50%, carload lots, 11½c; less than one ton, 13c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ½ set; 14oz., 40s., 9c.

COAL.—San Francisco, coast, yard prices: Wellington, \$3; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$5.00. Cargo lots, Eastern and foreign: Wallsend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$11; Welsh Anthracite, \$14.00; Rock Springs, \$8.50, long ton, Colorado Anthracite, \$14.00. Coke, \$14 per ton in bulk, \$16 in sacks; Sunnyside, \$11.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 27@28c ½ lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 66% B, 2c ½ lb.; soda ash, \$1.90 ½ 100 lbs.; hyposulphite of soda, 2½@3c ½ lb.; blue vitriol, 5½@6½c ½ lb.; borax, concentrated, 7@8c ½ lb.; chlorate of potash, 12@13c; red sulphur, 5c; alum, \$2.00@2.25; flour sulphur, French, 2½@2c; California refined, 1½@2c; nitric acid, in carboys, 8c ½ lb.; caustic soda, in drums, 3@4c ½ lb.; Cal. s. soda, bbls., \$1.25 @1.50 ½ 100 lbs.; sks., \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls., 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linedseed, boiled, bbl., 73c; cs., 78c; raw, bbl., 71c; cs., 76c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 64c; cs., 70c; raw, bbl., 62c; cs., 67c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls., 19c; wooden bbls., 22½c; cs., 25c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 21½c; 86° Gasoline, bulk, 20c; do., cs., 26½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14½c; do., in cs., 21c; Lard Oil, No. 1 bbl., 60c; cs., 65c; Neatsfoot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6½c; 1 ton and less than 5 tons, per lb., 6½c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—in bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7½c; less than 500 lbs., 7c.

ASSAY LITHARGE.—Per lb., 8½c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c ½ lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, ½ lb., 60c.

MAGNESIUM.—Per lb., \$3.00.

MANGANESE.—(90% and over) ½ lb., \$1.25.

MERCURY.—Bichloride, ½ lb., 90c.

MOLYBDENUM.—25c. ½ gramme; 1000 grammes—2½ lbs.

PHOSPHORUS.—(American) ½ lb., 80c.

SILVER.—Chloride, ½ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ½ lb., \$1.00.

URANIUM.—Oxide, ½ lb., \$3.50.

ZINC.—Metallic, chemically pure, ½ lb., 50c.

ZINC.—Dust, ½ lb., 10c.

ZINC.—Sulphate, ½ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

New Patents.

Dewey, Strong & Co.'s Scientific Press Patent Agency, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

703,751.—GARMENT—W. P. C. Adams, Olympia, Wash.	703,877.—FRUIT GRADER—W. C. Anderson, San Jose, Cal.
703,891.—LOO REOISTER—W. B. Armstrong, S. F.	703,519.—RACKET—A. Becker, Seattle, Wash.
703,515.—TIE PLATING MACHINE—G. L. Bender, Los Angeles, Cal.	703,952.—CAPPING MACHINE—L. J. Borie, S. F.
703,533.—KILN—Butler & Kunze, S. F.	703,782.—VENTILATOR—Carpenter & Baker, Los Angeles, Cal.
703,694.—AMALGAMATOR—J. V. Coleman, S. F.	703,658.—PUZZLE—F. De Ford, Pasadena, Cal.
703,781.—SALES BOOK—C. E. Frisbie, Oakland, Cal.	703,571.—FLOW—A. K. Goodrich, S. F.
703,916.—FRUIT CLEANER—J. T. Haley, Alhambra, Cal.	703,927.—LOOK—C. S. Huntington, Los Angeles, Cal.
703,847.—COMB CLEANER—S. L. Kietter, Los Angeles, Cal.	703,706.—OIL BURNER—A. S. Meyer, S. F.
703,443.—SPIKE PULLER—N. F. Murphy, Bakersfield, Cal.	703,817.—DREDGER—R. A. Perry, S. F.
703,471.—ORE CRUSHER—A. J. Petter, S. F.	703,853.—BILL CARRYING DEVICE—A. W. Thierkoff, Redding, Cal.
703,824.—OIL FEEDER—C. Q. Quinn, Port Costa, Cal.	703,819.—SASH HOLDER—W. M. Reedy, Spokane, Wash.
703,742.—CLOTHES HOOK—C. Salmond, S. F.	703,852.—CORSET—Nettle Temple, Stockton, Cal.
703,853.—BILL CARRYING DEVICE—A. W. Thierkoff, Redding, Cal.	703,875.—STORAGE BATTERIES—W. E. Winship, S. F.
703,877.—GATE—B. Wolverton, Portland, Or.	

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

THRESHING MACHINES.—No. 703,061. June 24, 1902. G. W. Heinke, Stockton, Cal., assigned to Houser & Haines Mfg. Co. of same place. This invention relates to improvements in that class of machines known as "combined harvesters," in which a threshing machine is mounted upon bearing and steering wheels and has a header attachment projecting from one side by which the grain is cut, means for transmitting the grain and delivering it to a feed mechanism upon the threshing machine, which in turn, supplies the threshing cylinder, and means in the rear of said cylinder for transporting and separating the straw, grain and chaff; this mechanism all being driven by power derived from the rotation of the bearing wheels of the threshing machine as it travels over the ground.

ACTIVE MATERIAL FOR STORAGE BATTERIES, AND PROCESS OF MAKING SAME.—No. 703,375. July 1, 1902. W. E. Winship, San Francisco, Cal. This invention consists essentially in the electrolytic reduction of a suitable lead salt in a forming bath under the following conditions: That the said salt be formed in a mass by a process so that it shall not disintegrate on immersion in the forming bath; that the lead salt be soluble in the forming bath, but not to the extent that the form of the mass (in the shape of plates or other configuration) is altered; that the combination of lead salt and forming bath is such that with a suitable current density the previously amorphous mass of lead salt is transformed into an spongy lead consisting of a mass of threads of lead (technically known as "lead trees") which are generally parallel to each other and perpendicular to the exposed surfaces and which occupy the volume of the untransformed mass. It is further desirable that the untransformed mass have at least a slight superficial conductivity, so thereby the mass of lead trees is more uniform through its volume.

UMBRELLA DRIP CUP.—No. 703,323. July 1, 1902. P. W. Pray, San Francisco, Cal. This invention is adapted to catch and hold the drip from an umbrella when the latter is held in the hand. It consists of a hinged mouth adapted to pass over the end of the rod, said receptacle having an annular series of inwardly and downwardly projecting spring members, said members curving outwardly at their ends and adapted to bear against the rod on all sides and retain the receptacle or cup in position.

FRUIT GRADER.—No. 703,887. July 1, 1902. W. C. Anderson, San Jose, Cal. Assigned to Anderson-Barngrover Mfg. Co., San Jose, Cal. This invention is particularly designed for the separation of fruit from the various grades which are recognized as standard upon the market, and is adapted to provide a machine of the greatest capacity and efficiency, which is adapted to the combination in a fruit grading and classifying apparatus of grading screens, fixed, downwardly divergent, transversely disposed surfaces centrally beneath the screens, transverse hinged dividers co-acting with said surfaces to mingle or divert the products of contiguous screens; longitudinally arranged bins and longitudinally hinged sliding boards, turnable to receive the banded product and divert it to the bins on either side.

DREDGER.—No. 703,817. July 1, 1902. R. A. Perry, San Francisco, Cal. One-half assigned to Atlantic, Gulf & Pacific Co. of New York and San Francisco. This invention is especially designed for excavating material which is submerged beneath water. It consists in a mechanism by which the excavation is produced by a forward reciprocating movement in the line of the boat and apparatus, and the corresponding extension of the conveying pipes, and mechanism for retracting the apparatus after the forward movement has been completed, placing it to make another cut parallel with the first, whereby a series of cuts are made radially outward from a fixed point exterior to and at the rear of the dredge boat. It also comprises means for advancing the fixed center and bringing it up to the rear of the dredge boat after a complete cut has been made so as to place the apparatus in position for another forward cut. Other parts and details are included, and described in the specification.

MECHANICAL BILL-CARRYING APPARATUS.—No. 703,853. July 1, 1902. A. W. Thierkoff, Redding, Cal. This invention is designed for the convenient carrying of bills. It consists of a disk, drum or other support for holding bills with offset and hinged spring-pressed holding plates hinged thereto, forming essentially a continuation of the surfaces, the free edges of the plates acting to hold sets of bills in such a manner that they can be easily exposed for inspection. This invention obviates the necessity of clamping wires passing over the tops of the bills and which take up considerable room.

MANIFOLDING SALES DEVICES.—No. 703,781. July 1, 1902. C. E. Frisbie, Oakland, Cal. The object of this invention is to provide a book of simple construction capable of being carried in the pocket of the salesman, a book in which the pages are not likely to become soiled by contact with the carbon as the leaves are drawn out and in which the original and duplicate checks may be torn off separately and simultaneously. It consists of a case partially opened at one end, means for inserting the paper folded or rolled in one or more sheets within the case, a guide by which the direction of the paper may be changed and directed over the top of the case, arms independently movable, but having hinged reference to each other, whereby the paper is held taut on the top of the case and the carbon normally supported out of contact with the paper, a knife by which the sheets of paper may be torn off, and a flexible inclosure for the case.

WANTED.

Wanted to Bond a Dry Placer Claim, One Rich in Flour Gold.

Must be a dry proposition. Address "Placer Claim," care this office.

WANTED.

Consulting Mining Engineer, familiar with making examinations of mines, prospects and mineral lands. Address stating experience and references. Moderate salary to start, with advancement to competent man. Position permanent if found satisfactory. Address A. care of Mining and Scientific Press.

SITUATIONS WANTED.

Practical and technical mine superintendent ten years' experience in Pacific Coast mines. Assayer, millman and construction engineer. Local references. Address "Mineral," care this office.

WANTED.—Position as Assayer and Bookkeeper in a mine; experienced in underground work; good references; present position not desirable. Address Box No. 127, care of this office.

WANTED.—Position by a technical graduate. Am an experienced stamp and cyanide millman, good assayer and chemist. U. S. deputy mineral surveyor. Can handle any kind of a mill or mine. Address Technical, care of this office.

ASSAYER, familiar with cyanide practice, desires position as assayer, or in some capacity, in stamp mill. Address X, care of Mining and Scientific Press.

PHYSICIAN AND SURGEON with three years' experience in both emergency and general hospital, in addition to experience in mines and private practice, wishes position in a mine. Best of references. Address Box 123, care of this office.

PRACTICAL MILLMAN—AMALGAMATOR, Cyanide Man and Assayer, wishes position School of Mines graduate. Best references. Address R. B., care of Mining and Scientific Press.

CHEMIST AND ASSAYER, WITH TWENTY years' experience in mill and smelter work. Can run same. Address A. C., care of Mining and Scientific Press.

MINING ENGINEER, practical miner and mill man, assayer, etc., desires position of superintendent or assistant manager of a big property. Eleven years' experience. Best references. Now working in southern California. Address A. M. P., care of Mining and Scientific Press.

Cyanide and Stamp Mill Superintendent open for engagement after September 1st. Graduate. A thorough assayer and chemist; also accountant. Speaks Spanish. Will go anywhere. Specialty, construction; also successful in assaying low grade and slimy ores. References "A. I." Address Practical, care of Mining and Scientific Press.

WANTED.—SITUATION AFTER MARCH 15, 1902, as Manager or Superintendent of mine. Have had five years' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work. Four years' experience as manager and superintendent. Treatment of low grade ores a specialty. Practical in every detail. State location of mine and salary. Best of references. Address X. Y. Z., this office.

A technically educated Mining Engineer, at present employed as assayer, wishes position of one of the largest corporations in Mexico, desires a change of position to the United States about July 1st. Has had 18 years' successful experience as engineer and superintendent, never having made a failure; 36 years of age; strictly temperate; a skilled designer, geologist and metallurgist, and a practical miner, as well as a hard worker and thorough and experienced. References of the highest order, including present employers. Address Supt., care this office.

FOR SALE.

CALIFORNIA RICH GRAVEL GOLD MINE.

Equipped with bulldozers, tools, etc. Lower tunnel now running. No prospect. Small amount of treasury stock for sale to complete the mine. Best of reports by leading experts. Land patented. No encumbrance. This is a snap. Write for prospectus.

E. S. ARMSTRONG, Room 313 Chamber of Commerce Bldg., Chicago.

Gold Mining Properties For Sale.

Two First-Class Placer Mines, one having 20 years' record as a producer. Both in good working condition. Terms reasonable. Address "Enquire," care this office.

The Mines Exchange, Ltd.

Mines and prospects in British Columbia, the Western States, and Mexico, for sale. Free milling gold properties a specialty. Write us for reports and information. Bank references given. Address THE MINES EXCHANGE, LTD., P. O. Box 700, Nelson, B. C. Branch Office: P. O. Box 584, Salmon City, Idaho.

DELINQUENT SALE NOTICE.

REWARD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Pine Grove, Amador County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 10) levied on the 23rd day of May, 1902, the following amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Oert.	No. Shares.	Amt.
Fraser, J. P.	147	1,000	\$20.00
Fraser, J. P.	105	500	10.00
Stadfeld, J. Jr., Trustee.	91	500	10.00
Stadfeld, J. Jr., Trustee.	92	500	10.00
Stadfeld, J. Jr., Trustee.	93	500	10.00
Stadfeld, J. Jr., Trustee.	94	500	10.00
Stadfeld, J. Jr., Trustee.	95	500	10.00
Stadfeld, J. Jr., Trustee.	96	400	8.00
Stadfeld, J. Jr., Trustee.	141	300	6.00
Stadfeld, J. Jr., Trustee.	142	200	4.00
Stadfeld, J. Jr., Trustee.	233	1,000	20.00
Winterberg, W.	164	5,000	100.00

And in accordance with law, and an order from the Board of Directors, made on the 23rd day of May, 1902, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Room 58, No. 309 Montgomery street, San Francisco, California, on MONDAY, the 21st day of July, 1902, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. STADTFELD JR., Secretary. Office—Room 58, No. 309 Montgomery street, San Francisco, California

Forms of Copper Ore.

Carbonates and oxides of copper, green, blue, red and black ores, are always found above the water line. The red oxide when pure carries 88% copper; the black oxide 78%; the carbonates (green and blue ores) 70%; but all those when taken out in considerable quantities contain impurities that lessen the percentage of copper from one-third to one-half. The red oxide frequently has a small core of native or metallic copper, and the red oxide surrounds this core. Below the water line, and often above, sulphurets of copper are found, generally a yellow sulphuret—chalcocopyrite; when pure this ore of copper carries 35% copper and 30% iron, but usually owing to impurities, the average does not exceed 10% to 15% when the ore is taken out in quantity. The richest ore of copper being found within a few hundred feet of the surface, a copper prospect where there is a fair market for copper ores, is a poor man's mine until the water line is reached, but to make it profitable careful assorting is necessary; no ore is more likely to deceive an inexperienced miner in assorting than copper ore. The ores of copper almost universally were originally sulphurets, above the water line as well as below, especially near the surface the sulphurets have oxidized, becoming in the first instance sulphates. The sulphates are soluble in water and the waters at and near the surface have dissolved a part of the sulphates and carried them into all the little seams and even into the body of adjacent rocks, coloring them with the beautiful green and blue common to carbonate copper ore; the smallest possible amount of sulphate of copper sufficient to color a considerable quantity of the adjacent rocks. After the coloring matter had penetrated in this way into adjoining rocks, nature, in its mysterious alchemy, changed the sulphate into a carbonate containing only a small percentage of copper, and an amateur finding large quantities of this highly colored rock near the surface may imagine himself the owner of a large and valuable lode of copper. In assorting, therefore, in order to make copper mining profitable, great care and judgment must be used in separating the really valuable ore from the highly colored valueless stuff.

The influence and potency of mining is notable in the growth of the iron and steel industry of this country. It is customary to ascribe such success to the tariff. But the mining engineer and metallurgist

is the real creator. Cheap production of iron through modern mining methods and cheap manufacture of steel by modern metallurgists, coupled with low transportation charges and automatic machinery, are what has made and maintained the great iron and steel industry of this country. The protective tariff is a secondary feature.

The British Columbia Government has before it a bill providing for compulsory arbitration. The Leg-

The Ajax Mine, Victor, Colo.

On page 35 appears an engraving of the shaft house and buildings of the Ajax Gold Mining Co., Victor, Colo. This property is equipped with fine machinery. They have a double flat rope hoist capable of hoisting 2000 feet, cross-compound air compressor large enough to operate thirty-six air drills, water tube boilers aggregating 1135 H. P., electric light plant sufficiently large for running 650 lamps, four electric motors, complete electric signaling system throughout the mine. A machine shop complete in every detail is operated by electricity. The self-supporting steel stack is 135 feet high. A three-compartment shaft 1000 feet deep is on this property. There are ten ore bins 125 feet long, 60 feet high, holding in the neighborhood of 1000 tons of ore. The waste from the ore house is run through a washer and good values are saved from the ore. The ore is taken from the bins and elevated 57 feet by means of Link Belt Machinery Co.'s car haul (this is the only chain car haul of its kind in the district) and dumped into cars for shipment to the United States Reduction & Refining Co.'s plant at Colorado City for treatment. All the ore is shipped via the Colorado Springs & Cripple Creek District Railway, which is controlled by the mine owners. About 200 men are steadily employed at this mine.

The engraving on this page shows two double-deck cages at the mine, six men on each deck.

CALIFORNIA county boards of Supervisors are appropriating considerable money for descriptive literature showing the advantage of stock, wheat, vegetable and fruit raising. This is commendable, but to a miner it looks a little funny sometimes. There is naturally keen competition among producers of food products. Every additional producer tends to make his particular kind of product proportionately cheaper

and the men now in that business are taxed to induce additional competition. In the case of the gold miner he is a good customer of all producers and a competitor of none, and it makes no difference how many more mines alongside him the mint will continue to pay \$20.67 per ounce for his product. No county in California is spending a cent to thus advertise its mining attractions, and the only satisfaction to the miner in the present preaching of the gospel is that the more farmers and fruit raisers the more of their products he can buy for the gold he produces. Incidentally, the miner is considered able to take care of himself.

islature of British Columbia has a reputation for unwise and hasty legislation in respect to the mining industry, and any further legislation along these lines may be misconstrued. "Compulsory arbitration" sounds well in theory, but in practice would be a curious experiment on this continent. True, it is claimed to work satisfactorily in New Zealand and New South Wales, but under totally different conditions. Arbitration is always advisable, but to compel it takes away the very principle of arbitration which implies voluntary agreement by both parties in dispute to have the controversy determined by some third party.

MINING SUMMARY.—38-39-40.

LATEST MARKET REPORTS.—41.

MISCELLANEOUS.—Concentrates, 32. Extraction of Gold by Chlorobromination (C. Grollet's Process), 33. A New Line of Diamond Drills; Chemical-Metallurgical Notes, 34. Hoisting Works for Deep Mines; Hydraulic Mining Costs; Aladdin Reading Lens, 35. Taylor & Brunton Sampler, Goldfield, Colo.; Liquid Fuel—Boiler Firing With Oil; A New Form of Cupel, 36. Mining and Metallurgical Patents, 37. Personal; Commercial Paragraphs; Recently Decided Mining Dividends; New Patents; Notices of Recent Patents; Obituary, 41.

It is not easy to correctly answer the numerous location dispute questions that come, for even if a court decision he cited in support of an assertion, another decision can sometimes be quoted overruling the former one. Where A locates a claim, fails to do the required \$100 work for the current year, but resumes work after his claim has expired, though before any other person has made a location thereon, A certainly has the only good "title." For though B may "locate" the claim subsequent to A's resumption of work, B acquires no rights thereby. In this regard it is to be borne in mind that the annual assessment required by law is not to keep alive the title to the claim, but to prevent it from collapsing. It makes no difference whether the annual work for the year in question was done or not, so long as the locator had asserted his rights in the following year before any attempt had been made to relocate the claim. That is: If a man does not do the required amount of work in a given year, his claim has lapsed. If, however, he begins work on the claim during the following year, before another location has intervened, he re-establishes his rights, his location being practically an original location, and no other locator can obtain title by going back to any lapse of which he has not taken advantage in time. Meanwhile, if a locator fails to perform the necessary assessment work, he takes the risk of losing his claim. Such a claim is jumpable under the law. Five dollars' worth of work would do if possession was not disputed, while \$99 worth would not be enough if the claim were jumped before the resumption of work in the following year.

THE president of the United Mine Workers has announced a general convention to be held on the 17th inst., at which it is stated that an effort will be made to abrogate existing contracts or agreements under which hituminous coal miners are now working. There is so much personal and political effort and so much business competition mixed up in these disputes between coal miners and operators that it is sometimes difficult to determine the exact facts. But whatever the rights or wrongs of coal miners or owners one fact stands out prominently, viz.: No friend of the coal miner will advise him to commit a breach of contract which is a breach of faith. Business demands everywhere and at all times that a contract mutually agreed to and after due consideration formally accepted should be lived up to. This is not original nor a new discovery, but it is in occasional danger of being lost sight of. If the coal miners' organization refuses to be bound by its own obligations and agreements while seeking to hold the other side to its agreement, it will forfeit the right

to demand serious consideration of any such future arrangement. It is not a question of strikes or labor organizations. That was settled long ago. All labor anywhere and everywhere has the right to organize, to strike, to make demands and quit if such demands be denied. That is the unalterable and inalienable right of a worker in any capacity, but no one man or set of men are anywhere justified in setting aside the rules of business, and one of these rules is that a contract for a certain time should be faithfully kept by both parties thereto. To do otherwise is not honest, and whatever in business is not honest cannot stand. It appears that the miners themselves realize this, but that some of the ambitious leaders want to make personal capital out of their ability to persuade their followers that it is good business to break an agreement that they themselves proposed and which the other side is faithfully keeping. Such kind of work never wins, and even if it did success of that kind is always worse than failure.

Inducing Investment.

"We have a splendid mining district here and all that is required is capital to show how rich it is. Capital is needed to develop our many promising prospects." The above, hoiled down, is the gist of numerous letters weekly received at this office. They all read just about the same, and, doubtless, are mostly true. With some there is a sort of hurt feeling manifest, as though "capital" was to blame in ignoring that locality. "Capital" doubtless does miss many a good chance for investment, and when one sees the columns of fake mine schemes in Eastern papers, he thinks how much good money is fooled away on these swindles—money that could with great mutual profit develop deserving districts. But "capital" is not to be blamed for its neglect or refusal to invest, for, though in those days of big money looking for 4%, mining comes in for heavy investments, capital everywhere seeking business opportunity; yet as well seat one's self in a corner of a 40-acre lot with a pail between one's knees expecting a cow to break in and step up to be milked as to expect "capital" to invest in any mining district without sufficient inducement. The possession of mineral wealth is not enough. It should be made known. One good way is to help the local newspaper. This is an age of advertising, and the press is the best for announcement. Tell the local editor the truth, buy his paper and pay for it. What he says about your prospect, if it has the right ring to it, will be noted by the larger journals and thus get before "capital." When "capital" does get as far as your town, don't assume that it can be easily led. "Capital" is usually shy and you must secure its confidence. Tell the truth; the truth is good enough and most people believe it. Don't inflate prices. Let the buyer have a chance to make a little. True, the prospect may be worth \$100,000, but wouldn't it be better to take a little less than to hold out for your own figure. "Capital" is willing to take chances sometimes; but if it goes away, you may have to hang on to your \$100,000 property for some time, and may even die waiting. Twenty-five thousand is worth more to a live man than a \$100,000 prospect to a dead one. Then, too, if "capital," when it gets to your place, takes a fancy to some property other than yours, don't tell the visitor that he will be sold if he buys that, or that you can put him on to something better. Let your neighbor, friend or enemy, make a sale if he can. The next best thing to having money yourself is for some one else near you to have it. It would be even well for you to praise the other fellow's property a little—much better than to "knock" it. One investment, if satisfactory, leads to another, and the sale of your neighbor's property may help you to dispose of yours. Of one thing be sure: "Capital" will be ready to believe any mean things you may tell it, and will feel like taking the next stage out of the place, while a little broad gauge treatment may be the means of considerable resultant good to all concerned. Of course, you know all this already, without being told; you've heard it before, but yet we continue to quote what we cannot improve. This is homely, but true.

Many a mining camp of merit has been "queered" forever by the mistaken notion of its residents that a would-be investor who strays in there is a fit sub-

ject for imposition. While they cannot affect the existence of mineral in the ground if they keep men from going down after it, the result is the same as if the ore were annihilated. Millions of dollars of ore in the ground will never benefit its owner nor the community unless it is taken out, and the men who are able to go after the ore should be met fairly by the prospector or promoter to the mutual benefit of all. Prohibitive prices and misrepresentation never opened a mining camp.

Besides telling your local editor the true news and buying his paper, and showing in all ways that you appreciate his value, give him a little advertisement of your property. You won't lose anything by it. It were also well to take and carefully read a good mining paper. You will often see therein the names of men who are on the lookout for mining property; write them briefly, setting out in short meter what you think your local advantages are. Get your neighbors to make up a little purse and have some neat circulars printed; send those out to any address that may seem to you desirable; 99 out of every 100 may be wasted—circulars usually are—but one out of each hundred may start an inquiry. Just consider you have something to sell—that needs advertising, and advertise accordingly. The fact that you write to this paper as you do shows that you partly appreciate this fact—systematize the idea.

You cannot attract deserved attention except in some such way. It is just as good business to advertise the resources of a mining district or the merits of a particular property as to advertise a concentrator or a hoist. The idea is to make a sale and do business. There is an immense field, and one that needs cultivation. If you think you can't handle that kind of work, get some one whose business it is—some one in whom you have confidence—and pay him to do it for you. Tell him just how much you can spend and let him arrange accordingly. This does not exhaust the subject, being merely suggestive.

Books and Serials.

The mining and scientific advance is at present so rapid as to present the singular spectacle of discrediting some of its own recent literature. Books on mining or metallurgy are becoming less valuable than serial publications on the same subjects. As an illustration of this, an article in this journal in the May and June issues on smelting is in advance of any published bound volume on that point. This is not an unusual thing in the case of the MINING AND SCIENTIFIC PRESS, but is referred to as the most recent illustration of the fact noted.

Mining and metallurgy are progressing too fast for the makers or writers of books thereon to keep pace with the advance. A book on smelting or lixiviation published this month is out of date next month, because some invention or improvement in progress while the book was being written becomes a practical system and begins to be put in operation as the book begins to circulate. The real literature of the mining and metallurgy of to-day is found in the columns of such publications as this. This is not said in derogation of the admirable work of many distinguished miners and metallurgists, who have with commendable care and accuracy compiled valuable treatises thereon. To them great credit is due, and they have frequently been found to ably supplement current information by extended and patient preparation of material. The fact is that without any blame to them the march of invention is so swift that no writer of books, however competent or zealous, can keep up with such rapid development. Some day, perhaps, this "march of invention" may make a halt long enough to enable writers of books to catch up with the "present state of the art," but it does not look that way just now. The technical literature of the twentieth century is found in the current publications. The books partake more of the nature of reviews and verifications, and as such their value is not to be decried.

THE receipt at this office of the Journal of the Chemical and Metallurgical Society of South Africa is among the evidences of returning prosperity to the Rand region. The September, 1899, issue was stopped by the war, and since then there has been an interregnum, now happily removed.

Concentrates.

THE present annual world's output of lead is estimated to be about 1,000,000 tons.

A "LIGHTNING-ROD" is neither useful nor ornamental; its only value is to the seller.

FROM the first record in 1848 to Dec. 31, 1900, California's gold yield aggregates \$1,345,576,044.

A POUND of zinc in the shape used in cyanide precipitation exposes about 1500 square feet of surface.

THE lead production of the world for the year ending June 30, 1902, may be estimated, approximately, at 650,000 tons.

FOR results of experiments in treating titaniferous ores our correspondent might write to A. T. Rossi, 35 Broadway, New York City.

PINE or fir rifle blocks for sluices are apt to occasion loss of gold, because of the pitchy grease exuding therefrom, flourishing the quicksilver.

THE museum at the California State Mining Bureau, San Francisco, is considered by many to carry the finest mineral collection in the country.

THE letters "M. C. B." on some freight cars mean that that car's construction has been approved by the Master Car Builders' Association.

THE ordinary rule for proportional dimensions of mine post timbers is that the diameter of the post in inches should be equal to its length in feet.

STIBNITE, an antimony sulphide (Sb_2S_3), is the common ore of antimony, and the only one from which that metal is obtained in the United States.

THEORETICALLY, from an orifice 1 foot square at a depth of 20 feet there would be discharged in ten seconds 358.6 cubic feet, or 2682 gallons, water.

ALCOHOL has no effect upon copper, but if iron, tin, lead, zinc or galvanized iron be kept in continued contact with alcohol, an oxidized deposit will result.

OF ALL THE HEAVY METALS copper has the greatest affinity for sulphur. If both come in contact in a finely divided state, they combine at ordinary temperature.

IRON may be quickly and easily cleaned from rust by dipping in or washing with nitric acid one part, muriatic acid one part and water twelve parts. After using, wash with clean water.

THE principal present uses of aluminum are for electrical conductors, as deoxidizing agent in steel manufacture, for making bottle caps and boxes, for advertising novelties and toilet articles.

AT the Lincoln mine, Sutter Creek, Cal., the use of oil for fuel shows a saving of 30%; at the Onaida mine it is figured that oil at \$1.50 per barrel is equal in economic value to wood at \$4.50 per cord.

TO FORM a normal solution of sulphuric acid, add 98 milligrammes of the acid to a cubic centimeter of water. For caustic soda solution add 40 milligrammes of the sodic hydrate to a cubic centimeter of water.

IT is believed that the water problem at Leadville, Colo., can only be successfully solved by pumping, as the formation of the country makes it very difficult to drive any deep tunnel that would drain the whole district.

PLATINUM loses weight when heated in air and even more rapidly in oxygen. It is thought that the loss in weight is due to the chemical action of oxygen in attacking and removing certain elements from the platinum.

COMPANIES have incorporated at various times to build a steel tubular tunnel under San Francisco bay, but the ferries still do profitable business. The project is feasible and will be a reality before the close of the century.

THE standard length of steel rails used to be 28 and 30 feet. It is now 33 feet, owing to the increased length of the cars. Rails are made as long as 60 feet. The Santa Fe road runs steel box cars 40 feet long; weight (empty), 44,900 pounds.

THREE gallons per stamp per minute would be a fair allowance for a 10-stamp mill. Where water is scarce settling basins are economical. By such use the total amount of water required need not average over 500 gallons per ton of ore crushed.

TO RUN A DYNAMO with a gasoline engine is a little out of the ordinary line, but if the gas engine be provided with a heavy balance wheel, or a countershaft with a heavy pulley upon it, it probably could run steadily enough for such purpose.

PHOTOGRAPHS are now considered an essential part of a modern mining report, and the camera is coming into prominence in connection with mine workings. Its chief use is in photographing maps of mine workings, and, in general, a photographic record of construction work.

"LIMITED" in the title of a corporation means considerable to English companies. Under English law stockholders in a company not "limited" are individually liable for all the debts of the company; in a limited company their liability is limited to the amount of stock they own.

VANADIUM and the platinoid metals are occasionally found in the ashes of coal, notably in New South Wales. Some Australian coal has been shown by analysis to contain as much as 0.44% vanadium and 0.63% platinum metals. That is, one ton of such coal would yield 144

oz., 1 dwt., 3 gr. metallic vanadium and 20 oz., 13 dwt., 11 gr. platinum metals. Gold and copper have also been found in appreciable quantities in coal from the Lithgow colliery, New South Wales.

THE West African gold coast is a different proposition from the South African gold fields, being less productive and unhealthy. No one should think of going there except at a good salary guaranteed by responsible parties, and with a sound physique, to withstand disease and exposure.

EASTERN investors in mining stocks are not always favorably disposed to the "non-assessable" feature in proffered stock, realizing that it is often difficult to raise necessary funds on non-assessable stock, unless the officials of the company become personally responsible for the debt.

IN using nitric acid for parting there is likelihood of missing any possible platinum present. Bullion supposed to contain platinum should be cupelled at a higher temperature than gold or silver. With the use of sulphuric acid for parting the platinum is insoluble, remaining with the gold.

TO ASSAY zinc precipitates, 1-10 A. T. of the slimes thoroughly mixed with three times their weight of litharge is placed in a scorifier, covered with forty grams of lead and scorified as usual. The litharge oxidizes the zinc before it can volatilize, the reaction being $2\text{Zn} + \text{PbO}_2 = 2\text{ZnO} + \text{Pb}$.

UNDER present conditions the production of light without heat is as apparently impossible as in the last century. Of every 100 tons coal used at gas works or electric light stations about ninety-seven tons are (so far as the production of light is concerned) absolutely wasted in the production of useless heat.

THE California Debris Commission construes the meaning of the term "hydraulic mining" to be "mining by means of water under pressure through a nozzle." The Civil Code of California defines hydraulic mining to be "mining by means of the application of water under pressure through a nozzle against a natural bank."

LEAD POISONING in dry carbonate mines is not infrequent, the bad effects being largely due to the fact that lead, unlike other metals, tends to remain in the system, its bad effect being thus cumulative. As a preventive or antidote, perhaps, nothing is better than water for drinking, in each quart of which is two drops sulphuric acid.

IN obtaining a patent for a mining claim a mill which is situated on another claim cannot be credited to the first claim as improvement to establish the \$500 expenditure required by law as a condition precedent to patent. A mill, while an indirect benefit to a mining claim, is deemed of no direct benefit or aid to the actual development of the claim.

TO DETERMINE copper, iron or zinc in a cyanide solution, take from 500 to 1000 c.c. of solution, acidify with a slight excess of sulphuric acid, add six grams of pure acid sulphate of potassium, evaporate to dryness in a platinum dish and then heat to dull redness to melt the mass. The metals are obtained as sulphates and can be melted and estimated in the usual way.

THE Mining and Metallurgical Institute of London, England, annually awards a gold medal and premium of the value of \$250 to the author of the paper of highest merit contributed to its Transactions by any member of the Institute upon the mining, treatment, or reduction of gold ores. So far as "Concentrates" knows no similar award is so made by any association in this country.

CHROME ORE carrying 50% is commercially profitable if mined close to sources of demand; but as there is no import duty, and the Atlantic freights are but about \$3 per ton to New York, where most of the demand is, there is little incentive to mine it anywhere west of the Mississippi. It exists in plenty at various sections and at times has been produced in considerable quantities in California.

SEVERAL demurs have been received regarding the fifth concentrate in this column in the issue of the 28th ult., which read: "With the piston speed 100 feet per minute, and the plunger 4 inches diameter, a double-acting pump would discharge 76 2/3 gallons per minute." The item should have had the word "theoretically" attached. With 85% efficiency the actual practice would be 65.23.

A GOOD nickel-bronze alloy for steam fittings, etc., is: Copper, 70%; nickel, 20%; zinc, 10%. All the zinc and half the copper are melted together, then cast and reheated into small thin pieces. All the nickel is placed in the bottom of a crucible and then are added, alternately, layers of the copper-zinc alloy and the other half of the copper, and covered with charcoal. The resultant metal shrinks in cooling.

WHERE several claims lie in a group and are under one or joint ownership, the required annual assessment work may all be done on one claim, if the work so done is for the benefit of all claims. The notice of labor having been performed posted on the mine should state this fact, and a notice should be posted on each claim of the group making similar statement and setting forth where the assessment work has been done.

THE resistance of a wire varies inversely as its cross-sectional area. A wire three sizes smaller than a given wire will have a resistance twice as great, and a wire three sizes larger will have a resistance one-half as great,

as that of the given wire. The ratio between the resistance of any wire in the B. & S. gauge and that of next higher number is that of 1 to 1.26. The ratio between the resistance of any wire in the B. & S. gauge and that of the next lower number is that of 1.26 to 1.

TO prepare a paste for mounting purposes, mix three-quarters of an ounce of starch with a little water to form a smooth cream; pour on sufficient boiling water to make ten fluid ounces; soak half an ounce of glue in cold water until soft, pour off excess of water, melt the glue down by gentle heat and stir into the paste previously made; add one dram alum and four drops oil of cloves; stir well until dissolved. If the material should dry too hard, add two dm. glycerine.

SEVERAL places in California have produced gold finer than 978. One placer claim in Plumas county had gold 985 or \$20.36 per ounce; some from Vallecito, Calaveras county, runs 987 or \$20.42 per ounce; some from San Guiseppe, Tuolumne county, ran 998 or \$20.2305 per ounce. Pure gold is \$20.67. There is an extended chapter on this subject in the Souvenir volume of the California Miner's Association for the American Inst. M. E., page 175, written by Chas. G. Yale.

AS THE top of head-frame is not mentioned in the inquiry, it may be assumed that a vertical, two-post frame is contemplated, and that the axle of the sheave is about 40 feet above the collar of the shaft. In this event the center of the winding reel may be placed at a distance of 55 feet back of the center of the shaft—a 5-foot sheave being used. This is a convenient distance and does not necessitate a very long back brace. The resultant strain under these conditions would fall about 23 feet back of the center of the shaft, and the angle brace should be outside of this—in the direction of the reel—a short distance, 1 1/2 to 2 feet. If the back brace be placed in the line of strain back of the sheave, the angle brace would be about 40 feet in length. The position of hoisting reels with reference to a shaft is very often determined by the contour of the ground. The above suggestions are made on the assumption that the hoisting engine is placed on or near the level of the collar of the shaft.

THE introduction of superheated steam into engines largely influences the expansion of the heated parts. Engines always give great trouble when the distribution of the metal in the cylinders is not uniform, as parts with more metal expand most, and force the cylinder walls toward the inside and make the cylinder out of shape. Any kind of gun metal gets brittle after a short time, so that valves, seats, and all parts in direct contact with superheated steam, must be made of cast iron or other suitable mixture. Copper also loses about 40% of its strength at that temperature, consequently copper bends in pipes are not practicable. The best material for piping has proved to be wrought iron and steel, each pipe being as long as possible, to have the least number of flanges. For long, straight pipe connections, provision must be made to meet the expansion, which is, at 700° F., 0.0037 of the length, so that, for example, 100 feet of pipe extends 0.37 feet, or nearly 4 1/2 inches.

HIGH SPEED engines are usually considered those whose speed of revolution exceeds 200 per minute, while low speed engines seldom exceed 100 revolutions per minute. The length of the stroke is usually shorter in proportion to the diameter of the cylinder in the high speed engine than those of the low speed variety. The length of stroke in a high speed engine having a cylinder 12 inches in diameter will range anywhere from 10 to 16 inches, while in a low speed engine it will be from 24 to 36 inches. High speed engines are generally of the single valve pattern fitted with a flyball governor driven by a belt when of the throttling type, and with a shaft governor and direct connected positive action valve gear when of the automatic cut-off design. The low speed engines, with a few exceptions, employ four and six valves which are actuated by a releasing valve gear in some instances, and a direct connected gear in others. The governors are usually of the flyball type connected to the releasing or trip mechanism.

A MEXICAN PERTENENCIA is the equivalent of the American claim only in the term itself, the pertenencia being 100 meters square; it takes about eight pertenencias to correspond with the claim in the United States in superficial area. Any one can locate as many claims in one location in Mexico as he may desire. The lines of a claim extend down perpendicularly and not as in this country, and a prolific source of litigation in the United States is thus obviated in the southern Republic. Different prices rule in different districts for locating a claim. At Ures the cost is slightly over \$30; in Magdalena and some other districts it is \$40. After location the claim must be surveyed. This means bargaining with a surveyor for the best terms possible, but it usually costs from \$100 to \$300 to get the work done. Then \$10 a pertenencia, or claim, has to be paid for a title and \$2 stamps for the deed. When the title is delivered \$6 more is handed over in some districts. After this there is the yearly tax of \$10 for each pertenencia paid to the Government. Two claims wide and five long make a location 600 feet wide by 1650 feet long. On such a location the taxes would be \$200 a year. All the amounts quoted are in Mexican money. In American gold the amounts would be a little over one-half. The mining law of Mexico is a good one. There is room for amendment, however, for its provisions practically prohibit working on seams and small lodes, unless they are very rich. The small miner is hardly in evidence in Sonora, while in years past the product of his labor added materially to the country's mineral resources.

Extraction of Gold by Chlorobromuration (C. Grollet's Process).

The Grollet chlorobromuration process for the extraction of gold from its ores and from products containing it, consists in the simultaneous employment of chlorine and bromine, with the aid of pressure in certain conditions.

The chlorine is produced in the midst of the matter to be treated, and in the apparatus used for the purpose. The bromine may be introduced, either in the form of bromine, or in that of hydrobromic acid, or in that of any other bromine compound capable of giving bromine by its decomposition under the influence of suitable reagents. The reagents forming chlorine and bromine are introduced simultaneously in one lot or in several—preferably in two—lots, at the beginning and at the middle of the operation, which is thus divided into two phases. One of the characteristics of the process is the production, in the interior of the apparatus, of an excess of chlorine with a view to attain the object indicated subsequently. The quantities of chlorine and bromine necessary vary with the nature of the ore to be treated. The quantity of bromine is always too insignificant to render its recuperation advisable. It averages 200 grammes per ton of ore treated. The recuperation may always be done if economic conditions render it advantageous. The roasting of the substances to be treated is not always necessary with this process. It will, however, be shown subsequently that roasting is often necessary to recover with the gold all the other products that the ore contains. Engineers engaged in the metallurgy of gold have unfortunately paid too little attention to this important question. It is in this way that ores considered to be too poor to be treated advantageously, might be profitably worked.

It is well known that chlorine and bromine brought together may combine, giving two chlorides of bromine, the protochloride BrCl and the pentachloride BrCl_5 . The protochloride begins to dissociate at a temperature of about $+10^\circ \text{C}$., at a pressure of 700 millimetres, but this dissociation is not sufficiently intense for the chloride of bromine to exist at a higher temperature or even for it to be partially distilled. By the intervention of pressure the rapidity of this dissociation is diminished.

Bearing these principles in mind, the process is carried out in the following manner: Into the apparatus, preferably a rotating barrel, the reagents (products serving to form chlorine and bromine) are introduced, care being taken to add these reagents in such quantity that there is a large excess of chlorine. To the reagents a quantity of water is added, which varies according to the nature of the ores, so as to make the mass slightly liquid. At first, the nascent chlorine finds itself in the presence of the bromine; at this moment the nascent chlorine, endowed with a specially active power, acts on the gold in the ore. Moreover, the gaseous chlorine, in contact with bromine, forms chlorides of bromine, liquid compounds presenting all the signs of a dissociation becoming more stable under the influence of an increase of pressure. Now, and this is an important fact, chlorine in excess produces (in the interior of the apparatus and in addition to the pressure that may be furnished by the chlorine and bromine of the chloride of bromine entering into dissociation) a supplementary pressure, thanks to which the bromine combines with a part of the chlorine to form chlorides of bromine, BrCl and BrCl_5 . Consequently the chlorine acts on the gold which it dissolves, not only before it combines with the bromine, but even after this combination, since it is in great excess. In this last case, that is to say, when chlorides of bromine are formed in the interior of the apparatus, with excess of chlorine, the dissolving action of this excess of chlorine is effected, the result being that the pressure in the apparatus is diminished. With the decrease of pressure, the chlorides of bromine dissociate, which results in the production of chlorine and bromine in the nascent state, the chlorine being always in excess; and consequently there is increase of pressure, formation of chlorides of bromine, and dissolution of a new quantity of gold by the free chlorine resulting in a new diminution of pressure, and so on until all the gold is dissolved.

This play of combinations and of decompositions, the key of which is in the chlorine in excess, then in the increases and decreases of pressure, is, moreover, susceptible of being produced by special arrangements, thanks to which these results may be obtained. It is the regeneration of the chlorides of bromine, which renders it possible to employ so small a quantity of bromine, an average of 200 grammes per ton of ore treated. The attack on the gold being completed, the ore is conducted into a filtering tank, or the filtration may be effected in the barrel itself if the latter is furnished with an interior filter. It is then submitted to methodical washings with water, washings which are intended to extract completely the chloride of gold formed. The filtered liquid is then conducted, by the intermediary of a special tank, known as an exhaust tank, into the precipitation apparatus. The gold is precipitated by any process, but preferably by sulphurous acid and sulphuretted hydrogen.

A. THE METALLURGY OF GOLD AND ENGINEERS.—Although the metallurgy of gold has made great progress during the past dozen years, it has not yet solved numerous problems that are presented to it. This regrettable fact is the reason why when gold extraction is being carried on, nothing is thought of but gold, and why when the extraction is easy, as much as 50% or 60% of the precious metal is left in the tailings. The Transvaal some years ago, and Australia at the present time, were, or are, covered by enormous heaps of tailings containing enough gold to be very profitably worked. In the Transvaal a large number of companies have done well by treating these tailings which had been abandoned. In Australia there are districts where ore is abundant, the tailings from which contain more than an ounce of gold. In the early days the aim of gold seekers was to extract the gold as rapidly as possible without paying attention to the yield obtained. This action can easily be explained, for gold seekers are empiricists whose knowledge of metallurgy is more than rudimentary. It is, however, more difficult to explain why many companies with large capitals are improvident. They build works which after a few years are useless. This is the case at the present time with mines in Western Australia whose situation is a critical one. Near the surface the mines have ores easy to treat, but, as the deeper levels were reached, complex sulphides and tellurides appeared, and the processes that were suitable at first are now useless.

What do the mining engineers who have charge of these mines and of the treatment of these ores, think? They wished to produce too quickly, thinking with culpable carelessness, that exploratory works were useless, and erecting plants capable of treating free milling ore, but which soon had to be abandoned in view of the difficulties of treating the ores from greater depths. Chlorination and cyaniding failed; the production fell off, the yields ceased to be remunerative, and the researches undertaken to find a suitable process cost considerable sums. Such is the state of affairs that has obtained of recent years in Western Australia, and what has happened in Australia has happened in other gold producing countries, and will be the rule in the future unless the matter is taken up, as it has been done by Mr. Grollet, by engineers with a thorough knowledge of the metallurgy of gold. The matter is one of difficulty, for an expert in the metallurgy of gold must be not only a metallurgist, but also a competent geologist, mineralogist, and chemist.

It is not enough for an engineer to be familiar with the metallurgy of gold, he must have a thorough knowledge of the metallurgy of the other metals, for gold is associated with a great number of these. This is an essential point from an economic point of view, for it is only the engineer that possesses such knowledge who can advantageously separate the other metals from the gold contained in the ores.

The elements constituting an ore are of two kinds, the metalliferous particles and the gangue. The importance of the former to the metallurgist has already been discussed. The other element, the gangue, plays an important part, and it also has been most often neglected, and, nevertheless, it is on it, in many cases, that the mode of treatment of the ores depends. By having disregarded this other element (quartz, magnesia, baryta, lime, etc.), and by having only considered the metals contained in the ores that the gold metallurgists have committed grave errors.

B. CONCENTRATION.—The separation of the different metallic species contained in a comminuted ore with the associated gangue and sterile rock, is based with rare exceptions on the differences in the specific gravity of the elements which are to be isolated. The separation is effected more easily and also more

fragments are classed according to their volume. In this way the products that should be obtained result from a classification which is based on the size of the equivalent fragments. It is applied to fragments of ore less than 0.0015 metre, or, in other words, to sands and slimes. Two methods are generally used to effect the separation of this material. In the first method, the matter to be treated is subjected to a horizontal current of water of decreasing velocity; the heaviest particles are deposited first, and the lightest last. The classes thus obtained are subjected to a vertical ascending current of clean water. The apparatus of this class are used for classifying sands of 0.0015 to 0.00025 metre diameter and for the simultaneous separation of all the finer particles of slimes. These appliances are known as sand Spitzkasten. In the second method the sorting is effected in the horizontal current only, without the aid of the ascending current. The slime Spitzkasten are of this type.

In order to separate the material classified by equivalence, the simplest method would be by screening. Two methods are, however, generally employed. In the first method, the mixed minerals classified by equivalence are placed on a screen covered by a bed of pebbles and subjected to an oscillating current of water with a short stroke (piston jigs), and by a suitable contrivance the fine particles filter down between the bed of pebbles and the screen, the larger grains remaining on top. In the second method the mixed minerals classed by equivalence are subjected on a surface slightly inclined, a table, to the action of a thin layer of water. It is there exposed to the action of the water, which runs with variable velocities at the different levels of the liquid layer. The result is that the different particles receive a different impetus according to their diameter, the finest roll slowest, the largest roll most rapidly, and are finally thrown off. The separation of equivalent sands is effected by two methods: piston jigs and tables (percussion tables, round budles, etc.). The separation of equivalent slimes is effected only by tables (circular rotating slime tables, Linkenbach's fixed slime table, Rittinger's percussion table, etc.).

(b) DRY SEPARATION.—Let us imagine matter falling in a vertical shower on a fluid itself animated by a horizontal velocity. The practical realization of this system would present great difficulties if water had to be employed for the purpose. The obstacle disappears if in its place a current of air is used. This gives rise to wind classifiers or dry separators. Their principle is analogous to that of the vanning of cereals. The vanner imparts to them periodically a movement that throws them vertically. The wind then acts in very unequal ways on the chaff and on the wheat, owing to the disproportions of the surfaces presented by the two substances for equal mass. The former is carried away by the air current, and the latter falls in place. This principle is applied with the aid of a continuous movement, and not an alternating one as in vanning, to slimes so fine that the contact of water converts them into a paste that cannot be dealt with by the different methods of washing. It is also employed with excessively thin layers, such as are given by the gold tellurides of Colorado which float and are carried away by the water. This method is also used in hot countries where water is wanting, the dusts there being naturally dry and very mobile. For this reason it is adopted at the Sonora gold mines in Mexico and in the gold mines of Western Australia. In other cases it is frequently necessary to subject the matter to be treated to a preliminary drying by the application of waste heat, such as furnace gas or spent steam.

Mr. Grollet made some experiments with an auriferous mispickel, the results of which are given in Table I.

TABLE I.

	Original Sample.	Sieve Very Fine.	1—Fine.		2—Medium.		3—Large.		Dust Chamber Light.
			Rich.	Poor.	Rich.	Poor.	Rich.	Poor.

The sulphur was not determined.									

completely when the difference of the specific gravity of the elements to be separated is greater. The separation may be effected by two means:

(a) Wet separation.

(b) Dry separation.

(a) WET SEPARATION.—In order to separate one from another and from the worthless matter, the elements of a comminuted ore, by the application of the principle of the difference of specific gravity, the following method is generally used: The comminuted ores are first classified approximately according to their specific gravity, and after that the equivalent

In these experiments a wire sieve and a hair sieve were used. The ore was first stamped dry through a No. 40 screen.

In its passage over the wire sieve the ore was divided into two classes, the very fine particles and another category, more considerable, which passed to the hair sieve. A classification by volume was thus effected. The hair sieve had three receptacles, in each of which rich and poor ores were collected. On leaving the sifter, the very light particles of ore passed into a dust chamber.

(TO BE CONTINUED.)

A New Line of Diamond Drills.

The Standard Diamond Drill Co. of Chicago, Ill., has brought out a new line of diamond drills. The officers and engineers of this company were for many years officers and engineers of the old M. C. Bullock Mfg. Co., founded by the late M. C. Bullock, whose chief specialty was the Bullock diamond drill. Soon after the death of Mr. Bullock, the officers of the old Bullock Co. incorporated the Standard Diamond Drill Co. and have designed and put on the market a new line of diamond drills. These drills are for the most part based on the old Bullock drills, but the knowledge of the Bullock drills and the experience in their use on the part of those connected with the old Bullock Co. have enabled them to design a new line of drills containing many points of excellence, the best features of the old Bullock drills being retained and new designs introduced.

The general arrangement of the drills may be seen in Figs. 1 and 2. The hoisting drum and engine are placed on a baseplate with the swivel head in front. This arrangement makes all the working parts of the drill accessible and enables one to remove the engine and supply its place with an electric motor by using a baseplate of slightly different design.

These drills are claimed by the manufacturers to be equally well adapted for being operated by either steam, compressed air or electricity. The engines are especially designed for diamond drill work, and the electric motors furnished are wound up especially for this purpose. It is to be noted that each of these drills may be fitted with either positive screw feed or the hydraulic feed. Fig. 1 illustrates the "D M" drill with the positive screw feed and Fig. 2 the "E M" drill with the hydraulic feed.

The screw feed gives a uniform rate of advance to the bit, ranging from $\frac{1}{16}$ -inch to $\frac{1}{8}$ -inch to each revolution. The change in rate of feed can be made instantly while the drill is running; this adapts it to rock of varying degrees of hardness. The swivel head for this type of feed is fitted with a thrust indicator, which shows the exact amount of pressure on the bit at all times, designed thus to indicate the instant the bit passes from one stratum of rock to another—an important point in drilling through minerals where it is not possible to get all of the core, as in very soft ore or coal. It is thus designed to locate fissures, crevices, etc. The hydraulic feed is of the double-cylinder type, the two cylinders being piped together and the feed controlled by one valve. With the hydraulic feed the pressure of the bit re-

heads. Before beginning the drilling, the drill is firmly bolted to the foundation timbers and is not moved until the hole is completed, insuring perfect alignment of the drill with the hole and preventing

drills—that is, those having a capacity of 4000 feet and upwards—are especially designed for rapid handling of the long line of heavy rods. A line of drill rods a mile long weighs about twenty tons. To remove and replace this line of rods in the shortest possible time is the problem designed to be solved by these deep-hole drills. Fig. 3 illustrates the feed gear of the "G M" drill, which has a capacity of 5000 feet. These feed gears are operated by a pair of tandem compound engines; each drill is equipped with a hoisting apparatus for handling the rods. These deep-hole drills were brought out to meet the demand for the deep prospecting required in South Africa and to reduce the time required in sinking deep holes.

The drill rods are all made especially for this work and to combine strength and lightness. The bit blanks are bored out of solid stock and care is used in tempering all blacksmith work. A feature of the Standard diamond drills is their inter-changeability of parts. Each drill is designed to be operated with either an engine or an electric motor; each drill may be fitted with a swivel head of either the screw-feed type or the hydraulic-feed type; each drill may be equipped with boring tools of any size, ranging from the Class "B," which cuts a $\frac{1}{8}$ -inch core, to the Class "E," which cuts a 2-inch core. Boring tools can be furnished up to 2 feet in diameter for special work.

Chemical-Metallurgical Notes.

PREPARATION OF CHLORINE BY MEANS OF CHLORATE OF SODIUM.—C. Graebe (Berichte XXXIV., page 645). Hydrochloric acid, sp. gr. 1.1, is heated to incipient boiling, and, by the aid of a stoppered funnel with a long, thin stem, a fine stream of commercial chlorate of sodium, 500 grams to the litre, is run in. The gas is thus given off at about 100° C., and only contains very small quantities of peroxide of chlorine, which in this proportion is without objection for the ordinary uses of chlorine. It can, however, be removed, if desired, by means of a wash bottle, ClO_2 being more soluble in water than chlorine is.

ELECTROLYTIC ESTIMATION OF COPPER IN IRON.—H. Koch (Ziet. anal. chem., 1902, 41, 105, 107). One hundred grams iron are dissolved in 400 c.c. of 30° B. sulphuric acid and the insoluble residue collected on a filter. If the iron is high in carbon, wash residue back into beaker and boil with fresh sulphuric acid to insure solution of the last traces of iron; then filter on same filter, wash, dry and ignite. Dissolve in hydrochloric acid, evaporate the solution to dry-

Fig. 2.—"E. M." Drill; Hydraulic Feed.

mains constant. This pressure is indicated by two pressure gauges, which enables the operator to adjust the pressure of the bit to the hardness of the rock, and to prevent undue wear on the diamonds.

These drills are all provided with hinge swivel

breaking the drill rods at the couplings and saving the time required to move the drill back in order to handle the drill rods in and out of the hole.

The drills manufactured by this company range in capacity from 350 feet to 6000 feet. The deep-hole

ness with sulphuric acid, redissolve in 20 c.c. of water and 20 c.c. nitric acid, sp. gr. 1.2; dilute to 120 c.c., add a few drops of oxalic acid and electrolyze for nine to ten hours with a current density of 0.094 ampere per square centimeter.

Hoisting Works for Deep Mines.

NUMBER IV.—CONCLUDED.

The president said there was undoubtedly a great deal of matter in Mr. Behr's paper which required very careful consideration and merited very full discussion. Mr. Irvine and others who had addressed the meeting had shown, as he almost expected, that in this case, as in most others, there were "two sides to every question." One of the chief points of difference which the discussion seems to have elicited was whether it was preferable to use heavy conical drums—such as would be necessary if taper ropes were employed—or lighter ones, as operating upon the Koepe or Whiting system the weights to be moved were far smaller, and the author scarcely seemed to have devoted quite as much attention to the merits of these two systems as they perhaps deserved. There was, undoubtedly, it seemed to him, a great objection to the use of heavy conical drums of large diameter, not only on the score of cost of construction, but in the matter of transport, which involved the inconvenience of sectionalizing them.

In the Whiting and Koepe systems, the drums being small, the engines get up to speed in three or four revolutions, and steam could be carried to the end of the run; and the remarks of Mr. Graves and Mr. Hughes bore upon this aspect of the problem. The difficulty caused by the rope slipping might, he believed, be minimized to a great extent by employing a special form of groove, the rope running on the driving pulley in a horn beam or on a rope packing. The slipping of the rope was a point which the author laid a great deal of stress upon, but Mr. Irvine had pointed out that what slipping took place was always a hack slip, and did not really seriously affect the question, as it was seldom excessive enough to cause much trouble. The system to which Mr. Irvine had referred in which the engine was set, as it were, at right angles to its usual position was, he believed, known as Marshall & Hopwood's, which had been described in the Engineer, and by its use drums of almost any length might be employed without fear of the rope overlapping on the drum or angling on the sheaves. The same result was obtained by the traversing engines at Dolcoath.

Another question of great importance that had been raised was whether winding should be done in one or two stages, and he could not help thinking that there was a great deal to be said for sinking as deep as possible in one lift, and, if requisite, providing an auxiliary winder worked, as might be done, perhaps preferably by means of electricity. The character of the material of which the rope was made must also largely influence the system adopted, as Mr. Jennings and as Mr. Hughes had pointed out, and the problem was to a certain extent in the hands of steel manufacturers, but beyond a certain length round ropes would not support their own weight. Mr. Whitmore had made the remark that the requirement of safety in the United States was not as high as that which appeared to be required in the Rand, one being 7 and the other 5, and this was another matter that must be taken into account, as it would be apt to modify the condition which had to be provided for; but doubtless a high factor of safety was desirable, especially when winding from great depths.

The two-stage system certainly appeared to be likely to prove a more expensive method than operating in one lift, and it presented various difficulties in shifting ore and men from one stage to the other, and to a certain extent must affect the life of the ropes and the ventilation of the mine, to which Mr. Rathbone had drawn attention. They were much indebted, he was sure, to Dr. Simon for giving them a description of the winding system he had described, and, as Dr. Foster had said, the system of "pneumatic hoisting" was not altogether in the air, as it had been used at the Epinae collieries by Mons. Z. Blanchett. He believed B. H. Brough gave some details of this novel system in a lecture on "Mining at Great Depths," which he delivered before the Society of Arts in 1896. The Hottinguer shaft, where this method was applied, was 1980 feet deep and 5 feet 3 inches in diameter. But he understood that the system described by Dr. Simon, about to be tried in Switzerland, involved the use of compressed air, instead of exhausting the air, which was the plan followed at Epinae. In considering a problem of this kind one was faced with the difficulty that, as in all pioneer engineering work, a number of side issues were involved, and the only satisfactory demonstration of theory was by practical trial; consequently, a number of the points at issue could be only argued in advance on purely theoretical grounds.

The application of careful preliminary investigation, such as Mr. Behr and those who had taken part in the discussion of the paper had bestowed upon it, might, however, and, he hoped, would be, the means of saving much waste of money that would be liable to result if the problem of deep winding was tackled, so to speak, blindfold on the happy-go-lucky principle, which had cost untold sums of money in times past. But, with more scientific methods and higher technical training, he thought such methods in mining engineering were becoming more rare, and were likely to become still more so.

Shaft House and Buildings, Ajax Mine, Victor, Colo.—(See Page 30)

Hydraulic Mining Costs.*

By W. E. THORNE, Georgetown, Cal.

CONDITIONS AND RESULTS OF OPERATION OF GOLD BUG MINING CO., AT GEORGETOWN, EL DORADO COUNTY, CAL.—This district drains into the American and Sacramento rivers, and is thus subject to the U. S. Debris Commission, which requires building a dam to impound the tailings. The property of the company lies in a canyon, 1½ miles long, average width 200 feet; maximum depth, upper end, 23 feet; minimum depth, lower end, 7 feet. The difference of depth is due to the existence, at the upper end, of "seam-diggings," which have been depositing their tailings in the canyon for fifty years. These tailings have been carried down and scattered over our ground by every freshet, until, at the present time, they constitute about 60% of our gravel.

The ground is worked through hedrock sluices, mostly 8 feet wide on the bottom, and laid in a cut having at the lower end the maximum depth of 25, and at the upper end the minimum depth of 4.5 feet. At the lower end each 12-foot box has a fall of 4 inches; at the upper end, the fall is but 1 inch per 12-foot box. There is 1300 feet of the 8-foot sluice and 200 feet of 4-foot sluice, making a total of 1500 feet of hedrock sluice.

The mudsills at the head of each box, 6 by 6 inches in size, are held in place by a drift pin of ¾-inch round iron, driven into hedrock horizontally, at each end. The intermediate mudsills are 4 by 6-inch pieces, placed on edge, and held in the same way as the end sills. The bottom is of 2 by 12-inch stuff, with a centerboard 1.5 by 18 inches, placed on edge, so that at low water one will carry the water while the other is being cleaned up. The sides, 36 inches high, are made up of two 1.5 by 18-inch boards on each side, and have a hatter of 1 inch in 6 inches, making the sluice 1 foot wider at top than at bottom. The sluices are paved with 6-inch blocks, set on end. The construction cost from \$4 to \$150 per linear foot. Hand drilling in hard diorite, which constituted a part of the formation at the lower end, was the cause of the maximum cost. Most of the cut is through Mariposa and Calaveras slates.

Our grade became so light (1 inch to 12 feet) at the upper end that we had to depend on the maximum flow of the creek (about 3000 miners' inches, which continues for only about fifteen days in the year) for our sluice-head. Our head for the giant was obtained, at a cost of 0.5 cents per hour per miners' inch, from a ditch owned by another company. We used, through a 3-inch nozzle, 200 miners' inches, under a head of 180 feet. Our average of material moved was 43.5 cubic yards per hour—a very low duty, due to our working up-stream.

Our supplies, delivered at the mine, cost as follows: Lumber (rough), \$14 to \$16 per M.; powder, 12 to 13 cents per pound in ton lots; fuse (triple tape), by the case, 50 to 55 cents per 100; caps (No. xxx), 60 to 65 cents per 100; round iron (½ inch diameter), 35 cents per pound; nails (cut and wire, by the keg) 35 to 45 cents per pound. The wages of miners were \$2.50 per day of ten hours.

Total.....\$0.183

* This item represents the total cost of such work, divided by the total capacity in tons of the reservoirs thus created.

† This item is exceptionally large, because of the short season of fifteen days, upon which the calculation is based, and the consequently small amount (7500 cubic yards) of material moved. The other items are more nearly a fair average; though, of course, the short season of operation had, in many ways, an indirectly unfavorable effect on costs.

The method above described was in operation when I took charge of the mine; and, to my request for permission to substitute a dredger or hydraulic elevator, it was replied that as the existing system had been installed under the advice of experienced placer miners, I must give it a trial. The result, as the statement of costs might lead an expert to expect, was not economically satisfactory; and we are now installing a hydraulic elevator, of which I hope to have something to say in the near future.

Two undercurrents were tried. No. 1 was placed about 700 feet below the lower end of the hedrock sluice. (It should have been at the sluice and connected with it.) It cost about \$1500, and saved about enough gold to pay the taxes and interest on that investment, together with the cost of cleaning it up. No. 2, placed 1500 feet below the lower end of the hedrock sluice, cost \$1700, and has never caught enough gold to pay the cost of cleaning.

Most men write of their successes only. Why not, once in a while, tell of a failure, as I have here done?

Aladdin Reading Lens.

The K. & E. Aladdin reading lens is designed for

Aladdin Reading Lens.

engineers, surveyors who work in dark or badly lighted places, like mines, tunnels, forests, or at

night, and others. It combines a powerful miniature electric lamp with a reflector and a reading glass, constructed so that the fine readings of verniers of surveying instruments, graduations of tapes, etc., can be conveniently and accurately taken in the dark. On removing the lens, the lamp is also an excellent illuminator for the cross-hairs of telescopes. Its light is at the same time free from the danger of igniting gases, which makes it valuable in coal mines etc.

As noted in the illustration, the K. & F. Aladdin reading lens consists of a miniature incandescent lamp mounted on a light handle, $4\frac{1}{2}$ inches over all. An adjustable polished metal reflector partly surrounds the lamp and carries a detachable fine magnifying lens. On the handle is a spring switch, which permits of establishing electrical contacts for short periods, by the pressure of a finger, or for longer periods, by the action of a sliding ring.

It is connected with the battery by conducting cords 4 feet long. The battery (dry) is contained in a solid sewed leather case, $7 \times 3\frac{1}{2} \times 2$ inches. It consists of four dry cells which, for renewal, are also furnished separately in a pasteboard box, ready to slip into the leather case. The leather case is of convenient size and weight for the side pocket, or it can be carried by a shoulder strap, with which it is provided. The complete outfit weighs two pounds, which includes less than two ounces for the lamp and conducting cords. To further save waste of battery energy, there is a switch on the outside of the leather case for cutting off the current when the lamp is not in use. The battery will give light for thousands of readings before requiring renewal. The lamp and reflector are arranged to amply illuminate the field of the lens. The lens is a high-grade reading glass, especially made for reading verniers, etc. It is supplied by the Keuffel & Esser Co., 127 Fulton St., New York City; 111 Madison St., Chicago; 708 Locust St., St. Louis, and 303 Montgomery St., San Francisco, Cal.

Taylor & Brunton Sampler, Goldfield, Colo.

Written for the MINING AND SCIENTIFIC PRESS.

About a year ago the business of the Taylor & Brunton Sampling Co. outgrew their plant at Victor and it became necessary to install another sampling mill

ple is again taken, and this sample, which now represents 0.16% of the original lot, is delivered into a steel box, which is carried by an overhead crawl into the sampling room, where it is cut down on a sheet steel floor by a quartering shovel to a convenient size for the dryer.

The sample going to the dryer weighs about forty pounds and would pass through a 12 or 14-mesh. After drying, the samples are ground in Englebach grinders to 120-mesh and divided into original, duplicate and umpire samples by passing the pulp through a peculiar-shaped rifle box, in which all the cutting edges are horizontal, and yet the rifles are identical in size, shape and slope and are self-discharging. The reject from all the different sampling machines passes directly to the loading bins, from which the ore is loaded into the cars by means of hinged steel chutes. The mill is entirely automatic throughout, the ore being handled by machinery at every stage of the process. The main building is five stories high, which, including the basement, makes six floors, carrying machinery requiring supervision, and, to enable the attendants to do this with celerity and comfort, a specially designed man-elevator is run continuously from the bottom of the mill to the top. Since the completion of the mill, April 26, it has been running night and day to its utmost, and arrangements have been made whereby the fixed supply of ore has been secured for a term of years.

Liquid Fuel--Boiler Firing With Oil.*

NUMBER III.—CONCLUDED.

By JAMES W. WARREN.

The statement has been made that it takes about 4% of the steam generated to operate the oil apparatus. We have made no experiments to demonstrate the accuracy of this figure, but our observations go to show that this percentage is large.

In a small plant like this, which is subject at times to a total shutdown in case the steam of all boilers goes down, it is impossible to start the fire, in which case an auxiliary steam generator must be employed, or the firebrick removed from the grates and coal be used to get up steam.

In installing this apparatus it is necessary to com-

kilowatt-hour as compared with the use of coal, it is impossible for us to tell, as prior to the present ownership of this plant, which changed hands last fall, no records had ever been kept of the kilowatt output or the tons of coal used per month, so that comparisons are impossible to obtain. There is no question, however, but that there is a very large saving in the use of fuel oil. It is claimed by the advocates of fuel oil that four barrels of oil, forty-two gallons to a barrel, are equal to one ton of good bituminous coal.

The results of tests show that the cost of burning fuel oil is exactly half the cost of burning coal, where the coal cost \$5 per ton and the fuel oil seventy cents per barrel.

A New Form of Cupel.

Written for the MINING AND SCIENTIFIC PRESS by JOSEPH VOYLE.

For the cupelling and estimation of minute heads of gold and silver, having lost a number of minute heads on ordinary cupels, I made various experiments to obtain some other method that would be safer. At first, success was promising by finishing the cupellation with a blowpipe on a new cupel; but sometimes the litharge was so completely absorbed that the force of the flame detached the head and blew it away. Finally, I found that a kaolin slab absorbed, or combined with, a limited portion of the litharge, and held the bead securely attached to its surface; also, that the beads could be brought to a uniform shape for each size, giving a standard form for estimation of volume, or weight, by micrometric measurement.

PROCESS.—Take kaolin and wash it well in water; pour off the slime only; let it settle in a flat-bottomed dish; put enough slime in to make a dry layer two millimeters thick. When nearly dry, mark it in squares about two centimeters across. When quite dry, divide and burn; the squares are then ready for use as cupels, or for qualitative slag color tests.

Cupel the assay button, as usual, until it is reduced to one millimeter in diameter; then move it to the kaolin cupel and bring it before the blowpipe flame; the litharge will form a transparent glaze on the cupel. The button may be allowed to move around or stay in one place; if it stays in one place, the litharge will dissolve the kaolin there and make a pit in the cupel.

The small bead should not be finished in the pit, but be blown out on the flat surface and heated very hot, so as to assume a nearly globular shape, and then heated slowly so as to retain that shape. The addition of borax will discharge the lead color and leave the gold head firmly held in a nearly colorless transparent glaze.

If it is desired to remove the head, it can be taken up by a small hot spatula while the glaze is in fusion, or the cupel can be broken across at the bead.

For measurement by a micrometer in a compound microscope, this cupel presents the advantage of a distinct view, a definite form and a strong adhesion to its support.

To estimate the weight, the micrometer must be calibrated to the standard form and size of heads of known weights, cupelled on the kaolin cupel.

To make a standard, refine some gold and heat it out to a very thin sheet; cut off a narrow strip and weigh it, to get an idea of size to cut required strips. Cut a strip more than a milligram; then trim it down until it weighs exactly one milligram; do the same for nine-tenths, and so on down to one-tenth, being careful to be exact. Then take the same size strip of pure lead foil and wrap around the gold. Now take the one milligram strip and fuse the gold and lead together on charcoal; then take a kaolin cupel and put the button on it, near one edge, and bring it before the blowpipe flame; when the head is cupelled to bright gold, heat very hot; let the point of the flame be a little on one side of the head, and the head will spin around on its center, taking a nearly globular form; gradually slacken until the head sets. Examine the head for perfect surface and shape; if defective, spin again. Do the same with the others on the same cupel, putting them in a row, according to weight. Now clear the glaze with borax, and the permanent standard of gold head values is ready for use. To use the standard, make an exact drawing chart of the micrometer; place the standard on the stage of the microscope; find the exact position on the micrometer of the one milligram head, then mark on the chart, and so with all the other heads; then make a reference table of weights under the chart; then, from the position of the tenths measured, calculate other tenths as far as required, and mark the places on the chart and table. When completed, there is a quick, simple and reliable method of estimating heads too small for accurately weighing on ordinary balances and not requiring any unusual delicacy of manipulation.

In shape the head is a globe, flattened where it rests on the cupel; the cupel being flat, the form for each weight is practically uniform.

A small achromatic microscope, giving thirty to sixty diameters, with an eyepiece micrometer, costing \$8, will answer for this work.

Taylor & Brunton Sampler, Goldfield, Colo.

somewhere in the Cripple Creek district. Goldfield was the point selected, on account of its central situation, excellent railroad connections and the suitability of the hill slopes for laying out an automatic switch yard, in which the cars could be handled entirely by gravity, thereby dispensing with the use of a locomotive for switching.

The cars are received on three storage tracks, from which they run freely into the unloading building, situated on the extreme right of the cut. The cars are discharged into a steel hopper, from which the ores are drawn by means of an automatic feeder into a 13×24 crusher, after which they pass through a pair of 14×32 rolls and are then elevated to the top of the mill.

From the elevator discharge spout a 20% sample is taken by a time sampling machine and fed into a pair of 14×36 rolls. From the hopper underneath these rolls another 20% time sample is taken, and this sample, representing 4% of the original lot, passes through the pair of 12×27 rolls. From the hopper below these rolls a 20% time sample is again taken, and the sample, which now represents 0.8% of the original lot, passes through a pair of 8×20 rolls.

From the hopper below these rolls a 20% time sam-

ply with certain rules and regulations of the insurance companies in order to prevent an increase in insurance rates. These rules, however, are not in any way unreasonable, but are necessary to afford ample protection to the plant. Their principal requirements are:

First—That the storage tanks shall be buried 4 feet under the ground and 10 feet from the building; or, if located more than 100 feet from the building, may be put above the ground or only partially buried, in which case they must be surrounded by a brick or earth embankment forming a reservoir of sufficient capacity to hold double the contents of the tank.

Second—They must have a gas-tight manhead at the top.

Third—They must not be filled in excess of 98% of their capacity.

Fourth—They must have a 2-inch vent pipe.

Fifth—The highest point in storage supply must be at least 2 feet below the level of the furnace where oil is to be burned, thereby preventing gravity feed to the boilers.

What the saving has been per horse-power or

* Read before the National Electric Light Association at its twenty-fifth convention held at Cincinnati, O., May 20, 21, 22, 1902.

Mining and Metallurgical Patents.

Patents Issued July 8, 1902.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR CONCENTRATING MAGNETIC IRON ORES.—No. 704,010; T. A. Edison, Llewellyn Park, N. J.

A connected apparatus for concentrating iron ore, comprising set of pulverizing rolls by which material will be finely pulverized, screen to which finely pulverized material is fed, means for returning tailings of screen to pulverizing rolls, magnetic separator for separating magnetic from non-magnetic particles of screenings of screen, drier for drying magnetic particles, fine screen to which dried magnetic particles are fed, second set of pulverizing rolls for repulverizing tailings of fine screen, second magnetic separator to which screenings of fine screen are fed and by which magnetic particles will be separated from non-metallic particles, dusting apparatus for dusting magnetic particles, third magnetic separator for effecting final separation of dusted concentrates, means for returning particles rejected by third separator to pulverizing rolls.

COAL PICK.—No. 704,039; F. Horn, Coshocton, Ohio.

Coal pick comprising helve socket provided with eye having lower wall reduced in width to present shoulder, pick having recess to engage shoulder, solid key firmly bearing against pick and walls of eye constituting non-yielding surface which will operate to prevent vibration of pick, in eye, under impact, one end of key being provided with stop, other end with laterally projecting members disposed exteriorly, operating positively to hold key against accidental separation therefrom.

METHOD OF BUILDING DAMS.—No. 704,181; A. D. Foote, Grass Valley, Cal.

Method of building dams and like structures, consisting in first separating associated material into its coarser and successively finer elements, then deliver-

ing these separated materials by chutes or the like to form successive embankments, commencing with the coarser and terminating with the finer material.

HYDRAULIC AIR COMPRESSOR.—No. 704,059; W. J. Linton, Woodstock, Canada.

In hydraulic air compressor combination with standpipe thereof and pipe for conducting compressed air therefrom, of valvular cylindrical section of diameter to rest upon top of standpipe; vertical cylinder; means for supporting same above annular section; piston within vertical cylinder; piston rod connected at upper end to piston and at lower end to valvular section; three-way valve; branch pipe connecting lower end of vertical cylinder to one port of three-way valve; second branch pipe connecting another port to the compressed air conducting pipe; horizontal cylinder located adjacent to three-way valve; piston within last mentioned cylinder; piston rod connected at one end to last mentioned piston; bell crank lever; means for supporting bell crank lever; one arm of bell crank lever being connected to outer end of last mentioned piston rod, other arm elongated and graduated in form of beam and having counterpoise movable longitudinally thereon; lever connected rigidly at one end to valve stem of three-way valve at its other end to outer end of last mentioned piston rod; branch pipe connecting second branch pipe to horizontal cylinder, means for guiding valvular cylindrical section in its movement to and from top of standpipe.

EXPANDING REAMER FOR OIL OR ARTESIAN WELLS.—No. 704,136; J. P. Smith, Peru, Ind.

The combination in expanding reamer for boring oil or other artesian wells, of reamer body A provided with screw threaded pin a, and having slot or opening B therein with the upper end h circular, and depressions or grooves b' and D D in inside faces of slot or opening or tapering block C connecting sides A' A' of body A between depressions or grooves D D, pair of jaws E E pivoted together at upper ends by means of pin e, and having joint circular so as to fit against surface b, bearing surfaces E' E' on lower portions of jaws adapted to fit against sides of block C, and ribs e' e' thereon adapted to fit into grooves D D, and spring actuated rod F adapted to raise jaws in slot or opening B in reamer body.

GOLD SAVING MACHINE.—No. 704,372; C. Ramos, Vancouver, B. C.

In machine for purpose specified, in combination with grizzly suitably supported on pivots and rockers over open framework; within such frame sloping dead plate 12 having perforations at lower end; grizzly 13 so pivoted below such that its slope may be varied; flap door 14 pendent on pins from lower part of dead plate 12; rake 15 slidable in sides of machine, times of which are pitched to enter spaces between grizzly bars at flattest slope; dead plate 16 adapted to throw dirt toward opposite end of machine; perforated screen plates 17 pivoted at center, linked to lower end of grizzly 13; sluice box 20 pivoted at center, provided with stepped perforated receiving plates and cross riffles, with means whereby slope may be varied as desired.

ROCK DRILL CHUCK.—No. 704,081; M. McHale, Phoenix, and J. Trainner, Ebolt, Canada.

A drill chuck having curved tapering passage communicating with drill chamber, passage being circular in cross section and having ends leading out through wall of chuck at separate and distinct points, one above other, round curved tapering key fitting in passage, key provided with longitudinal groove in outer periphery.

APPARATUS FOR RECOVERING MINERALS CARRIED OFF IN THE FUMES OF SMELTING FURNACES.—No. 704,199; W. R. Lee, Marion, Ill.

Combination with smelting furnace, of precipitating chamber having baffle plates arranged therein, separating chamber into communicating compartments, induction flue connecting one end of chamber with furnace, and including means for accelerating projection of fumes to chamber and for moistening same, water spraying mechanism arranged in compartments, an eduction flue including suction mechanism connecting with other end of chamber, conduit for conveying precipitated materials from chamber, and settling troughs including valve mechanism connecting with conduit.

WATER ATTACHMENT FOR POWER DRILLS.—No. 704,158; F. L. Whitehead, Butte, Mont.

Attachment for power drills, comprising cylinder, coupling on end terminating in tube, cock on opposite end, connection from cock to fluid pressure supply pipe, second cock extending from side of cylinder and water reservoir in communication with cylinder through last-named cock.

ORE TESTING TABLET.—No. 704,409; H. E. Way, Custer, S. D.

As a new article of manufacture, composition tablet for testing ores comprising fuel, decomposable compound containing oxygen for burning fuel, oxygen compound being in greater proportion by weight than fuel.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

The Valdes, Copper River & Yukon Railroad Co. of Alaska has been incorporated. The road will be about 400 miles in length and will be extended to Bering strait.

At Hope City O. H. Sleeper has twenty men on the Bear Creek mine and will have his hydraulic plant in operation Aug. 1st.

The Resurrection Alaska M. Co. have twelve men getting the hydraulic plant in working order.

O. J. Thomas is sinking a shaft on the Resurrection property. He expects to sled \$50,000 worth of mining machinery to the claim next winter.

J. T. Cornforth, manager at Kenai, Northwest M. & Dev. Co., expects to start his hydraulic plant Aug. 15th.

ARIZONA.

COCHISE COUNTY.

The Calumet & Arizona Co. have bought the property lying between the Lowell and the property recently purchased by the Calumet & Pittsburg Co., known as the Del Norte mine and the Ormand group. The Calumet & Arizona Co. say they will double the capacity of the smelters now in course of erection at Douglas. It is locally stated that the smelter for the Calumet & Arizona Co., when completed at Douglas, will have a capacity of 600 tons daily.

At Bisbee a company has been incorporated, capital \$50,000, to build a street car line from the smelters near Douglas to that town, a distance of 1½ mile.

General Manager Bagge of the Black Diamond Copper Co. says that the 200-ton smelter is complete and ready to be blown in immediately upon the completion of the tramway, which will be ready for service Aug. 1. The tram is 3 miles in length; carrying capacity, 600 tons per day of twenty-four hours. He will use crude petroleum for fuel.

GILA COUNTY.

W. H. Mercer says the tunnel at the head of Mineral creek, to develop the Mercer & Valentine property, is in 220 feet. It has already gone through 28 feet of sulphide ore carrying 4½% copper.

The experts' report on the Old Dominion mine has been sent to shareholders. The Mining Record says the briquette works connected with the Old Dominion smelter will soon be ready. The profits of the company for the past year are reported to be \$2,000,000, or \$1.33 per share.

MARICOPA COUNTY.

The Winters group of gold mines has been sold to Hall & Dunkley of Chicago, Ill., for \$75,000. The property is in the San Domingo district, between Phoenix and Wickenburg, and includes the Roosevelt, Joe Wheeler, Brodie and Annie claims.

E. M. Keeley will erect the Socorro's 20-stamp mill near Wickenburg.

Wickenburg reports that a 2½-foot ore body has been struck at the bottom of the Garcia shaft which samples \$50 to the ton.

The Ryland lead mine, near Morristown, is bought by the Wickenburg Smelting Co., and will be in operation in connection with its smelter.

MOHAVE COUNTY.

Regarding the organization of the Gold Road M. Co., now going on at Paris, France, O. P. Posey and C. K. McCornick are meeting with foreign interests.

PIMA COUNTY.

E. O. Stratton is operating the Barnite group of copper mines, 25 miles from Tucson. The property adjoins the Santa Catalina Copper Co.

PINAL COUNTY.

J. W. Sharpe of Los Angeles has bought the Wonder group of mines, 25 miles southeast of Florence, on the Gila river, and has started development. The ledge assays \$4 gold per ton and 5% copper. It is close to the line of the proposed railway between Phoenix and Benson.

YAVAPAI COUNTY.

M. R. Kiley, Supt. Oro M. Co.'s Boaz, on the south slope of the Bradshaws, has his 60-stamp mill running. The old Boaz mill had twenty stamps and he has added forty, making it the largest mill in the southern part of the county.

The assessed valuation of the United Verde Copper Co. in Jerome has been raised by the assessor from \$625,000 to \$1,200,000.

Prescott reports in the Baumann Copper Co.'s property, Agua Fria district, the shaft on the Laura 200 feet. Sample assays \$6 gold, \$1.75 silver, 34% copper.

Above the 50-foot level the best value obtained was \$2.40 in gold.

CALIFORNIA.

AMADOR COUNTY.

On the Del Monte, near Jackson, since its reorganization about \$20,000 has been spent in development work. The main tunnel has been run over 200 feet, with about 100 feet farther to go to tap the first ledge, making with power drills over 4 feet per day.

The Record says the June cleanup at the Central Eureka mine was \$26,000.

At the Edinburgh mine, Clinton district, near Jackson, operated by D. Fisher, a tunnel is being driven along the foot wall of the ledge. The croppings show 1000 feet from the mouth of the tunnel. The ledge has an average width of 12 feet of quartz similar in character and appearance to some that used to be taken from the Argonaut mine when it was paying dividends.

BUTTE COUNTY.

At Oroville six transformers were recently destroyed by fire. Loss to the Bay Counties Power Co., \$3000. The Indiana dredger will be idle until new transformers are procured.

CALAVERAS COUNTY.

The Lightner M. Co. has begun suit in San Andreas against the Utica M. Co. for \$120,000 damages, claiming that the Utica Co. have been taking out ore from the Lightner ground.

W. & D. Nuner are sinking on the Duraya property, Central hill. The lode lies between slate walls 25 feet apart.

The Lloyd gravel mine on Central hill is operated by a Boston company under the direction of F. F. Ames.

The new mill on the Angels quartz mine was started by Supt. Coleman on the 10th inst.

INYO COUNTY.

In the vicinity of Ballarat there are 100 miners at work. Eastern capital is being invested there, and more looking for an opening. The Cooper mine has been sold. There are nineteen men employed at Snow canyon. The Anthony mine is turning out bullion. The Radcliff is making satisfactory showing.

KERN COUNTY.

The Randsburg Miner says the Yellow Aster's new pumps will soon be installed and the 30 stamp mill started up. The Stanford, Phoenix and Atkinson's mill will be kept busy on their own ores and in doing custom work. The construction of the Baltic's 10-stamp mill goes on. The Consolidated M. Co. is preparing for work on its claims. The Butte is pushing development work.

LASSEN COUNTY.

Amadee reports a body of rose quartz, estimated at \$700 a ton, found by Shearer, Razer & Murphy at Granite creek. The route to the mine is by the Southern Pacific to Reno, thence to Amadee on the Nevada, California & Oregon Railway, thence by stage.

LOS ANGELES COUNTY.

The Alcatraz Asphalt Paving Co.'s outside interests have been bought by the Barber Asphalt Co. of New York. Headquarters for the Northwest will be in Denver, Colo., F. P. Caughlin district manager.

NAPA COUNTY.

The Empire Consolidated Quicksilver M. Co.'s old management has retired. The new board of directors elected are J. L. Board, R. A. Boggers, H. G. Atwater, A. L. Kempert, E. H. Wilson, J. P. Thomson, J. L. Wilson. The company will be reorganized, the capitalization to be reduced from \$5,000,000 to \$2,000,000.

NEVADA COUNTY.

An early decision in the Pennsylvania-W. Y. O. D. case is expected. The Union says whichever way it is decided it means the employment of a large force of men.

At Meadow Lake Supt. Murry of the Crystal Lake Co. has rebuilt the mill blown down last winter and intends to crush rock.

In and around You Bet there are thirty men employed in the Red Dog tunnel. J. Goodwin has twenty-five men at work in his tunnel. The old Red Dog ditch will be worked.

Work has been resumed on the Murchie mine, near Nevada City, under the management of J. C. Campbell.

PLACER COUNTY.

Cass & Eckhart, at the Tadpole mine, have nearly 200 feet of the main tunnel to develop the gravel property run.

The 10-stamp mill at the Central mine, known formerly as the Dover, has started up. F. Develley is Supt.

Near Sunny South the Hidden Treasure Co. has a new blue lead channel which cuts out 200 feet of the white gravel at a point 8800 feet in.

In the Peckham Hill mine Manager Nesmith will double the present force of

twenty men. Steam will be put in temporarily to work two power drills and later an electric plant will be installed.

The owners of the Lost Emigrant mine, near Summit, have a small stamp mill and will crush ore.

At Soda Springs W. Bradbury assumes charge of Heath & Goulden's Lost Emigrant mine.

SHASTA COUNTY.

The Graham Bros. of Copper City have bonded a group of seven claims, 3 miles below Copper City, to W. F. Mitchell for \$22,500. The ore carries gold, silver and copper.

For the Great Western G. Co.'s projected smelting plant at Copley the Southern Pacific Co. began 500 feet of siding from the track to the proposed smelter site.

H. C. Wybro, Supt. McCloud River Electric Power Co. at Redding, says he will proceed with construction of the projected power plant on the McCloud river.

The Trinity River G. M. Co. has organized to develop 240 acres gravel on Trinity river, 2½ miles above Dodge's.

The Dorleska mill, Coffee creek, is again running.

Development on the Tamarack mine, at Bully Hill, will be pushed. Drennan, Sweitzer, Allen & Erickson have a \$2000 payment on a \$20,000 bond to J. T. Wall and C. W. Meyers of DeLamar, G. T. Harnson and J. Cross.

SISKIYOU COUNTY.

A. E. Diggins and Rinehart in Quartz Valley near Yreka have a 4 foot vein that goes \$1,500 to the ton. The rock is a slate and serpentine formation.

The Siskiyou Electric Power Co. will put in a plant, power to be generated by a system of flumes and pipelines, taking water from Fall creek, 14 miles above Klamath. There will be 4700 feet of flume and 2837 feet of pipe line; the plant will have a capacity of 2500 H. P.; there will be a pressure of 700 feet. The company will furnish power and lights for the mines in the neighborhood; a pole line will be run to Yreka.

The Cherry Hill M. Co. has closed down indefinitely. The manager, E. D. Baker, says the company has been so harassed and annoyed by litigation and subjected to such impositions by parties claiming properties in the vicinity of the mine, that they prefer to let the mine remain idle, and will spend money in the development of other properties owned by them.

Near Seiad, Skein, Murray & Co., owners of the asbestos mines in the Red Hills, are working the property.—The Furber mine is bonded to a San Francisco company; six men are prospecting the ledge.

O. H. Hershey & Co. of South Fork of Salmon have machinery for a new 1000-pound stamp mill.

Ruddles Bros., in Scorpion gulch, near Trinity, have put in a new 5-stamp quartz mill.

A long tunnel is projected at the Yellow Rose of Texas quartz mine, on the headwaters of the Salmon river. The property is owned by G. L. Carr.

TRINITY COUNTY.

The California Mother Lode G. M. Co. organized in Spokane, Wash., to work their property 2 miles north of the Midas mine.

The Headlight quartz mine, near Carrville, will erect two new cyanide tanks right away, to enlarge the capacity of the plant to eighty tons daily. Fourteen men are on the payroll.

TUOLUMNE COUNTY.

Near Groveland, J. M. Melghan has a three years' lease on the Mt. Jefferson property. A company is to be formed, the mill started and a cyanide plant added.

Near Columbia, work is to be resumed at the Oakland mine. It has been bonded by E. J. Gilbert.—The Keltz mill is dropping its ten stamps continuously.—A new shaft is being sunk on the Treasure group for gravel.

Supt. Muir has men working the Richards gravel mine, near Springfield.

The Golden Dawn, near Black Oak station, is to be opened by Nicholls Bros.

The Mazeppa has begun building a 20-stamp mill.

Supt. H. C. Converse has the Draper in operation; thirty men are employed; ten stamps will be added.

Munroe, Birney and Wainwright will extend the Morris tunnel, now in 700 feet.

COLORADO.

ARAPAHOE COUNTY.

(Special Correspondence).—The Colorado Zinc Co., which has been closed down since June 27th for repairs, is now running again.

Denver, July 13.

BOULDER COUNTY.

(Special Correspondence).—The McKenzie well at Boulder is down 2580 feet and is the standard well of the field. Casing will be placed in the well and a

wall packer used. They will also use the California pump. Capacity of well fifty barrels per day. They are selling the oil at \$2.50 per barrel to gasoline engine and fuel men for use in stove burners and heaters. There is no question as to the market for the oil. They can sell all of the oil produced in the field to the Florence refinery, but do not realize the full value of the oil, as the refinery pays for only the refined contents. Preparations are now being made to erect a refinery at Boulder where they will do their own refining. There are fourteen producing wells in the field. There are 150 derricks; thirty wells are now being drilled. The territory in which oil has been found is 2 miles by 6 miles. There are no gushers in the Boulder field, but all the wells are a pumping proposition so far.

Boulder, July 11.

B. A. Langridge, representing Boston capital, has bought the Black Cloud group, Gold Hill district, \$25,000 down. The group is one of fourteen mines idle since 1880. The ore bodies were not sufficiently remunerative under the old prices of treatment. At the time they were closed \$42.50 a ton was the price charged for treating \$50 ore. Less than \$7 a ton is the price at the present time.

Wall Street reports the large and rich pieces of sylvanite ore from the Sphinx mine, at a depth of 140 feet, in sinking the main shaft on the lode, are owned by G. W. Teal of Boulder.

B. A. Langridge of Ward has sold the West Point mine to the West Point M. Co. for \$15,000.

CHAFFEE COUNTY.

(Special Correspondence).—The Accidental M. & M. Co. at Granite have been doing a great amount of development work since May 1, 1901, in sinking shaft and driving a tunnel. The shaft is now down 175 feet with two drifts, one at the 50-foot level, 35 feet, and one at the 100-foot level, 60 feet. The ore in the shaft is free milling and runs from \$24 to \$60 per ton. They now have the tunnel in 375 feet. Two hundred and thirty-seven feet from the mouth of the tunnel they cut a vein which has a pay streak 40 inches wide, which is a concentrating ore running \$15 to the ton. Three hundred and forty feet in they cut another vein 2 feet wide, which runs about the same. F. G. Mitchell is the manager.

Granite, July 13.

Another strike is reported in the Vivandiere mine at Turret.

The Independence has a shaft 7x12 feet to a depth of 80 feet and every bucketful taken out has been paying ore. New ore bins have been completed.

The shaft in the Anaconda is 150 feet deep. With an additional 50 feet, it is expected to be a paying mine.

Salida tells of a strike in the American Flag, one of the principal properties owned by the Sunset Con. M. & M. Co., Manoa district, a rich sulphide, carrying values sufficiently encouraging to justify increased working force. The vein is 3 feet wide. Manager Higham says extensive facilities are contemplated.

CLEAR CREEK COUNTY.

(Special Correspondence).—The Empire Tunnel Co., F. A. Maxwell, manager, have their tunnel in 1100 feet, and still driving about 5 feet per day. They have a pipe line 2400 feet long which supplies the water for their 6 foot water wheel. The drill men have encountered some very hard ore, which is the cause for the small amount drilled each day.

The Royal G. M. & T. Co., Empire, have run into an 8-foot vein of milling ore which assays \$9 to the ton. Alongside of this is a 4-foot streak of black sulphurets and solid smelting ore, making a 12-foot vein in all. The tunnel is now in 200 feet. These parties are preparing to put on a power plant to consist of compressor, drills, etc. Bids will be asked for shortly.

The Marshall-Russell M. M. & T. Co., Empire, have a 5-foot vein in the lower tunnel which runs \$10.80 per ton.

The Atlantic mill, Empire, which has been in operation the past four months, are handling fifteen to twenty tons of ore per day. They are at present handling the ores from the Gold Fissure mine. This mill is amalgamation and concentration.

Empire, July 9.

(Special Correspondence).—The Capital Prize Tunnel, Georgetown, are sinking a shaft from the tunnel level and are down about 75 feet. They have a vein 16 inches to 20 inches running \$51 per ton in silver, \$25 in gold, 5% lead and 2½% copper. The tunnel is now in about 800 feet and 700 feet of drifting. There is a 70-foot shaft from the tunnel level through to the surface. Twelve men are employed on the property, which is under the management of G. J. Hite.

The Georgetown Deep Mining & Transportation Co., operating the Kelly tunnel, B. F. Kelly, manager, are in over 650 feet, and still driving. Last month they made

a run of 184 feet with two drills. They have installed a third drill and expect to make rapid headway in future.

Georgetown, July 10.

(Special Correspondence).—The Franklin Con. M. Co. are operating the Silver Age and Franklin mines, also the Wilkie mill, using the Silver Age mill for a power plant. They have received considerable ore from the Saratoga in Russell gulch, Gilpin county, for treatment at the Wilkie mill.

The Bertha Gold M. & M. Co., Idaho Springs, which changed hands the first of July, B. Ross assuming control, opened up a slope 100 feet, 18 to 36 inches wide, in the Colfax shaft. The mill dirt assays \$11.50 per ton and the smelting ore \$45.50 per ton. C. J. Portner is the new owner of the Bertha mill, which he is operating steadily, principally on their own ore. The offices of the Bertha Co. will be moved from Denver to Idaho Springs. C. K. Miller, foreman.

The Bonieta mill, F. F. Reed, manager, is running fifteen stamps amalgamating and fifteen stamps concentrating. They ran some ore from the Grand Central mine of Central City and saved 96%.

Idaho Springs, July 11.

Georgetown reports the Clark group, owned by O. E. Clark of Pueblo, sold to the Waldorf M. & M. Co. for \$60,000. The group, which is in the East Argentine district, contains twenty-four patented claims, connected with the other holdings recently acquired by the company.

Rich ore is being mined at the Independence, through the Tobin tunnel, carrying gray copper, silver and gold. Manager Wilcox will drive a crosscut tunnel to the Stevens group in the East Argentine district, which is also owned by the company, thus cutting the different veins at a depth varying from 1000 to 2000 feet.

J. D. Hartshorn has a 6-inch streak of galena ore in the Pacific lode, on Republic mountain. The ore assays 63% lead, which, added to the gold and silver values, makes \$60 per ton.

Tunnel mining is becoming the only way in Clear Creek district, says McClelland of the McClelland tunnel at Dumont. "It takes longer to get at the mineral, but when you get there you are fixed and you know what you are doing. In districts where deep mining is necessary, as in our camp, the driving of tunnels is superseding all other forms of mining."

Near Empire, the Black Cat group, formerly owned and operated by a Denver company, and including the Little Hope, Portland and Snowstorm claims, has, since passing into the possession of practical miners, developed into an attractive property.

By the advance of the Empire Tunnel Co. into Covode mountain to a connection with many lodes crossing its course toward North Empire, the group of lodes recently acquired by the Republic Consolidated Co. on Covode mountain, including the San Pedro and Diamond B claims, which abut upon the tunnel, can be opened 500 feet below the surface by a short lateral, their extensions having already been intersected.

At Yankee, the Yankee Con. M., M. & T. Co. has started its Lombard mill on ore assaying \$15 to the ton. The mill handles ten tons every twenty-four hours. Manager Seeman has decided to increase the daily capacity to forty tons.

Coal laid down in North Empire is \$8 a ton.

GILPIN COUNTY.

(Special Correspondence).—The Slide lode in Russell gulch, which was sold in May to J. S. Shenneman and J. F. Werner of Bronson, Mich., is now down 85 feet and has smelting ore that runs \$62 per ton. This property is an extension of the Lillian lode and the vein carries both milling and smelting ore. It also is near the Old Town mine, which is working a large force of men and shipping every day. The property is located on the Gilpin county tramway and in time will no doubt be a good producer.

Unwatering the Charter Oak mine at Central City is finished. The shaft will be sunk 200 feet deeper.

During the first week in July the ore and concentrate shipments from Black Hawk to Denver and Golden smelters amounted to 1800 tons.

GUNNISON COUNTY.

Near Gunnison the Augusta M. M. Co., C. L. Arzeno general manager, is working the Augusta property. The tunnel being driven into Augusta mountain from the Pittsburgh camp side is in several hundred feet. When completed in January, 1903, it will cut the ore at 1600 feet depth. The company is packing out at present with a jack train from the Dark canyon side of Augusta mountain about five tons daily, which goes to the smelters. The output is small because of the inconvenience in getting it to a railway shipping point. The new tunnel from the Pitts-

burg side of the mountain will do away with the jack train. An aerial tram is to be put in to connect with the mill and also an ore station on the wagon road. A new mill with a probable capacity of fifty tons is to be erected to handle the milling ore. The Dark canyon tunnel on the west side of Augusta mountain is at present producing all the ore taken out. The tunnel has been driven in over 1000 feet and cuts the ore at a depth of 320 feet. The same company is operating the Excelsior and Yankee Blade lodes in the vicinity of the Augusta mine. This enterprise is known as the Black Queen M. Co. and was recently organized to develop the properties mentioned. A plant of machinery is being installed and air drills will work the new tunnel.

The Cochetopa mill being built at Cochetopa by the Colorado Con. M. Co., will be completed Aug. 1st. Twenty-five men are employed. The mill will have a capacity of forty tons daily. The mine and mill together will employ forty men.

HINSDALE COUNTY.

A 150-ton concentrating mill will be put in by the Henson Creek Lead Mines Co., 14 miles from Lake City.

LAKE COUNTY.

Near Leadville, in the Yak tunnel, there is an unusual amount of work. A new compressor will push the bore into the heart of the Ibez territory.

Near Leadville the South Evans & Ball Mountain M. Co. closed down July 1st to arrange for a new milling and concentrating plant. Manager Murray says the new plant will have a daily capacity of seventy-five tons. The shaft will be sunk another 100 feet while the mill is being erected.

Near Leadville the Big Evans M. Co. expects by Aug. 1st to have its new machinery in position for draining from the Hoffer shaft on the Bob Ingersoll claim.

OURAY COUNTY.

Ouray reports a rich strike on the Johnny Bull, Uncomphagre district.

The ejectment suit in which the stockholders of the Home pyritic smelter were the defendants, and which was decided against them, will be the means of starting up the workings again. W. Story is in possession and says that the smelter will soon be in operation for the treatment of large quantities of low-grade ores.

The new Camp Bird M. Co. is contemplating abandoning the Ouray office and having all the business transacted at the mine.

SAN JUAN COUNTY.

Near Silverton the Kendrick-Gelder smelter has blown in, with 5000 tons of ore on hand; capacity 100 tons per day, requiring fifty men. The new briquetting machine is in operation.

At the North Star, Sultan mountain, to fight the water in the lower workings will require an increase in pumps and an extra engine. Foundations are being prepared for a 300 H. P. boiler, two 125 H. P. engines, two 100 H. P. electric generators and motors and other machinery. The present 125-ton mill is to be enlarged and outfitted with additional machinery. On one side of the mill an addition of 70 feet will be built and on the south side an additional 90 feet for ten new concentrating tables.

On Bear creek for the Good Hope, Little Giant and Sylvanite mines a mill will be erected at the Good Hope to treat the ores by the Gage process.

SUMMIT COUNTY.

At Kokomo the Breene mine will ship 100 tons per day. The Wintergreen starts up next month. Mr. Shepherd of the Ten Mile will continue as manager. All mines are paying \$3 per day of eight hours.

A strike of ruby silver in the Eureka mine at Montezuma shows a 14-inch vein, assays running 5000 ounces to the ton.

Ueva lake, in the heart of the Ten Mile mining district, is bought by Howbert, Ford & Gard of Denver. In addition to the lake they have acquired a waterfall capable of generating power sufficient to operate the mines and smelters of Leadville, Kokomo and Robinson. The new owners plan the erection of a plant at the foot of the hill, 3 miles above Frisco. The Denver buyers have 285 acres of patented land and 790 acres of located land, besides the 55 acres of water, with average depth of 100 feet.

TELLER COUNTY.

At Cripple Creek the Vindicator Con. G. M. Co. pays a \$55,000 dividend to-day. The company has opened the main Lillie Vindicator vein at a depth of 1200 feet, the vein the same width as above, the values higher. The new pump was shipped on the 15th to be installed in the 1200-foot workings.

Work has been resumed by C. Crowder on the Maid of Orleans, Beacon hill, sinking 500 feet.

A. B. Demasters has a bond and lease in \$150,000 on the Maggie mine on Bull hill. The property consists of nine acres and

lies in the vicinity of the Gold Sovereign. The lessee is required to do 50 feet of sinking every month.

The officers of the Pharmacist Co. say that all the indebtedness of the company has been paid off.

The Brodie mill on Cripple creek, at Mount City, has been leased to O. B. Finn, who will treat low-grade oxidized ores. He has the lease on the Gregory dump of the Elkton, on Raven hill, and estimates that he has 15,000 tons of ore there that will average \$10 to the ton. The mill has a capacity of sixty tons a day. This is the third cyanide mill to treat the low-grade ores; fourth is to be erected by the Mineral Point Co. on the Mineral property.

Work is to be resumed on the Santa Rita property of the Atlantis G. M. Co. T. F. Caley has a two years' lease at 15% royalties.

The payroll for the Cripple Creek district for the month of June amounted to \$700,000.

The Practical Leasing Co. has been making a production of thirty tons of ore a day from the Trachyte and expects to be able to increase to fifty tons a day.

The deepest shaft in Cripple Creek district is the Eagles, 1540 feet.

IDAHO.

The U. S. assay office shows that the production of gold, lead and silver in Idaho during the calendar year 1901 was \$16,461,916.

BANNOCK COUNTY.

The sale of the ceded lands in the 5-mile limit was held at Pocatello this week.

BLAINE COUNTY.

Supt. Ford, operating the South Boise placers, near Hailey, has a channel 132 feet deep and 300 feet wide. The company owns 120 acres. Some of it yields 20 cents a cubic yard.

The Maryland G. M. & D. Co. organized at Hailey to exploit the Maryland, Golden Star, W. J. Bryan, Chicago and Boston lodes, on the Hailey gold belt.

IDAHO COUNTY.

At White Bird, E. M. Aldrich, who owns the Dorneck bar, will put in a dredger capable of handling a cubic yard of earth a minute. The property comprises eighty-five acres of placer ground, portions of which have been worked in the old-fashioned way for forty years. This will be the pioneer dredger of the Salmon river placers.

T. S. Hogan of Butte, Mont., secretary and treasurer of the Crooked River M. & M. Co., Elk City, says the company started with twenty stamps and will now add another ten.

F. E. Johness, Supt. Gold Ridge Co., owning the Fairview group at Thunder mountain, says he has orders from Pittsburgh to start up work on an extensive scale.

LATAH COUNTY.

J. M. Scafford and sixteen miners are working the Gold Bug, near Princeton, Idaho, on the headwaters of the Palouse river.

LEMHI COUNTY.

G. Sinclair, managing the Old Italian group of mines, says that another ledge has been found.

OWYHEE COUNTY.

The Avalanche says work on the properties of the Tibo-Bluebird Co. in Pixley Basin will be begun; the title to the property passes from Messrs. Ballard, Miller & Watts to a local company, capitalized at \$500,000. The Bluebird mines are in the Steele mining district on the southeastern end of the Owyhee range, 25 miles from Silver City.

A rich gold strike is reported at the Poorman mine. In 1866 the cost of mining and milling the ore in Silver City was \$66.07 per ton. It can now be done for one-tenth of that.

MONTANA.

BEAVERHEAD COUNTY.

Citizens of Bannack want some one with money to take hold of the property of the Western Mining Enterprise Co., which, it is said, consists of several gold-producing claims and a 20-stamp mill. The property is near Bannack.—The owners of the Polaris mine expect to sell the property to a New York company.—Two nuggets, valued at \$40 each, were found in French gulch recently. Several smaller nuggets were also found. It is said that the gravel is yielding \$50 per day.

DEER LODGE COUNTY.

The Inter-Alta M. Co., at the head of Gold creek, 10 miles from Pioneer, will develop the mine. The property now has two tunnels about 90 feet in length, both on leads 2 feet in width, each bearing a pay streak averaging 12 inches, from which assays give \$300 gold.

FERGUS COUNTY.

At Yogo, pending the final arrangements of the settlement whereby the Mc-

Lure syndicate secured the Burke and Sweeney sapphire mines for \$50,000, the working force has been laid off; operations are at a standstill. It is thought that work will be conducted on different lines under the new ownership.

FLATHEAD COUNTY.

(Special Correspondence).—The Blacktail G. M. Co. is running ten stamps full time and doing nicely. About thirty men are employed.

The American Kootenai and the Mother Lode properties are doing nothing, owing to some Eastern influence.

The Brick & Brannigan 10-stamp mill is running regularly, as well as the mines.

The Libby M. Co. mill will be in operation July 25; sixteen men are employed at mine and mill.

The Standard group is being worked is making a good showing.

The Way Up people have lost their building by fire, but are working the mine and rebuilding.

Considerable activity here and interest centered on methodical and practical milling, which heretofore seems to have been neglected. A complete assay outfit on the Blacktail has demonstrated many points heretofore disregarded, and the present management is thorough and painstaking.

Cabinet, July 9.

GALLATIN COUNTY.

Trail Creek reports work being pushed on the properties owned by the Amalgamated Co. It is probable the name of the new town will be Storrs.

MADISON COUNTY.

A. C. Sanders has taken a lease on the Grub Stake mine, near Pony, and has struck the ledge, which he is cross-cutting.

L. Cartier has sold the Toledo mine, near Sheridan, for \$40,000 cash. The new owners will renovate the concentrator and smelter. The Montana mine, 10 miles from Sheridan, is being worked under the supervision of F. Wright.

PARK COUNTY.

The Climax group is transferred to H. J. Miller, preliminary to the organization of a company at Livingston.

The Bear Gulch Co. has expended \$200,000 in development work. A cyanide plant has been decided upon. The foundation for the new 40-stamp mill is completed.

SILVER BOW COUNTY.

For the year ending June 30, 1902, some of the Butte mines give returns as follows:

Boston & Montana M. Co.—Expense of mining, transportation and treatment, interest and cost of selling copper, \$6,066,002; gross receipts from sales of copper, silver and gold, \$7,705,697; net proceeds, \$1,639,695.

Anaconda Copper M. Co., operating the Anaconda, St. Lawrence, Never Sweat, Mountain Con., Green Mountain, Bell and High Ore mines: Number of tons of ore extracted, 984,958; gross yield or value per ton, \$10.66; cost per ton for extracting ore from mine, \$3.80; total cost for extracting ore, \$3,742,312.20; place of reduction, Anaconda, 27 miles distant; cost of transportation per ton, 5 cents; total cost for transporting ore, \$147,743.77; actual cost of reduction per ton, \$3.32; total cost of reduction, \$3,267,182.32; amount of money expended for necessary labor, \$3,860,789.41; money expended for necessary machinery, \$3,143,705.11; freight, \$147,743.77; marketing, including seaboard charges for refining and selling, \$2,052,105.58; net proceeds, \$1,289,610.03.

Butte & Boston M. Co.—Number of tons extracted from Silver Bow No. 1, Silver Bow No. 3, East Gray Rock and Berkeley mines, 175,719; yield per ton of this ore, \$8.13; number of tons extracted from the Blue Jay mine, 13,780; yield per ton of this ore, \$10.60; total tons extracted from all these mines, 189,499; cost per ton for extracting from the four mines mentioned, with the exception of the Blue Jay, \$3.83; total cost for extracting ore from these mines, \$672,551.75; cost of transportation per ton, 18 cents; total cost for transportation of this ore, \$32,980.76; cost of reduction per ton, \$2.13; total cost of reduction, \$375,437.88; cost per ton of extracting ore from Blue Jay mine, \$6.94; total cost for extracting ore from this mine, \$95,202.37; cost per ton for transportation, 26 cents; total cost of transportation, \$29,285.64; total cost of extracting ore from all of the Butte & Boston mines, \$767,754; total cost for transporting ore, \$36,523.11; total cost of reduction of ore, \$404,723.20; amount of money expended for labor, \$709,689.73; expenditure for supplies, \$462,787.91; selling and marketing, including seaboard charges for refining, \$199,961.63; net proceeds, \$166,138.87.

Colusa-Parrot M. Co.—Mines operated, Burt, Woolman, Home, Original, Stewart, Dives, Colusa-Parrot; gross yield per ton, \$9.15; ore extracted, 276,926 tons; cost per ton for extracting, \$3.73; total cost of ex-

tracting, \$10,348.48; cost of transportation, 23¢ cents per ton; total cost of transporting ore, \$65,026; cost of reduction per ton, \$3.75; total cost of reduction, \$10,390.66; expended for labor, \$663,860; cost of supplies, \$370,988; net proceeds, \$397,475.

The net proceeds of the Gagnon mine, Colorado M. Co., as reported by Agent A. Husband, were \$152,249.22; number of tons extracted, 170,325; gross yield, \$925,706.41; total cost of extracting ore, \$506,808.74; total cost of transporting same, \$27,960.91; cost of reduction, \$265,441.54; net proceeds, \$152,493.22.

Parrot M. Co., operating the Parrot, Bellona and Little Mina mines: Gross yield, \$1,261,772.15; cost of production, \$684,154.36; net proceeds, \$577,617.

Snobomish and Tramway mines, by J. S. Harris, receiver: Net proceeds, \$70,849.

Onelda mine, owned and worked by W. W. Wilson: Net proceeds for year, \$1120.

Nova mine—Cost of reduction per ton, \$3; number of tons of ore extracted, 1000; expended for labor, \$2200; cost of supplies, \$2600.

W. H. Johnston, secretary Washoe Copper Co., operating the Moonlight and Cambers mines, stated that during the past year there were no net proceeds from these mines on account of the construction of the new reduction works at Anacoda.

Alice M. Co.—Statement by Supt. T. W. Buzzo: Total expenses for year, \$61,811; sold 5265.1 tons ore, value \$60,598; loss for the year, \$1213.

Lessees of silver and gold mines near Wakefield are pleased that the East Helena smelter is to resume operations.

J. J. Bullard has handed his North Moccasin mountain property to F. J. Hazen of the Great Northern M. Co. for \$50,000.

F. Farrell, who has spent \$1,500,000 in developing his claims in the East Butte district, will soon begin the erection of a 1200-ton smelter. A new process is to be employed, by which concentration by water will not be necessary.

YELLOWSTONE COUNTY.

A. P. Hart tells of the discovery of a 60-foot vein of copper-bearing ore on Credential creek, between Sunlight and Cooke City, which assays 15% copper.

NEVADA.

CHURCHILL COUNTY.

Engineer Tilton of the Southern Pacific Co. is going over proposed routes for a railroad from some point on the Southern Pacific to the salt deposit owned by the Independent Salt Co. in Churchill county. This company was organized by Swift, Armour & Cudahy to fight the salt trust. It has acquired 14,000 acres of salt deposit in Churchill county. The shortest route is said to be one from Woolsey, a siding on the main line of the Central Pacific 9 miles east of Lovelock. The route would tap the Cottonwood iron mines and other mineral territory. Another route is from Winnemucca. The distance—90 miles—is the greatest drawback, but this is offset by the fact that the road would pass over a comparatively level country.

HUMBOLDT COUNTY.

A 6-inch streak of ore in the Sheba mine, near Unionville, is said to show values ranging from 80 to 100 ounces in silver and \$10 per ton in gold.

The sulphur mining company operating near Black Rock has declared a dividend of 15 cents per share.

LINCOLN COUNTY.

The first of the new improvements at Bamberger's De Lamar mines will be \$30,000 worth of electric material for an electrical plant 8 miles below Calientes, and an additional battery of Chilean mills, which will permit the handling of 300 tons of gold-bearing ore daily.

The S. L. Tribune has advised of the final payment of \$600,000 by the De Lamar Mines Co. to Capt. De Lamar, but two formalities remaining unfinished, the ratification of transfers that have been agreed to by the directors of the April Fool and Boston and De Lamar companies in Salt Lake City. It is said that the articles of incorporation in which the capitalization is fixed at \$5,000,000 will be filed August 1st.

NYE COUNTY.

Manager Curtis of the Fraction Co. has bought the Magpie, Nancy Hanks, Rex and Laura B. mines at Ray and will develop the property.

W. H. Holabird, representing the Southern Pacific Co., has made a proposition to Tonopah to build and operate a standard gauge railroad from a point near Rhodes station, on the Carson & Colorado Railway, to Tonopah, provided the mining and sundry interests of Tonopah subscribe to bind themselves to pay upon the completion of said railroad \$250,000 to the Southern Pacific Co. The Southern Pacific says it will also add a third rail to the Carson & Colorado Railroad between

Rhodes and Mound House. The Southern Pacific Co. agrees to begin work thirty days after the money has been guaranteed.

G. B. Francisco has sold the Peacock mine, in southern Klondike, to T. L. Oddie for \$12,000.

The permanency of the mines at Weepah is prophesied. The Philadelphia Co. has several men at work, and as depth is gained coarse gold is found in the ore.

Stone Cabin district is apparently a parallel belt to the Tonopah range. The formation is porphyry, carrying gold values.

The Tonopah Extension M. Co., owning a group of claims 5 miles north of Tonopah, has a contract to sink a main working shaft 500 feet. G. T. Holladay is Supt.

The Tybo M. & R. Co. is shipping ore to Salt Lake.

ORMSBY COUNTY.

A small shipment of molybdenite was made last week from the Saxton-Cameron mine, 50 miles south of Carson, to the refinery in Connecticut.

STOREY COUNTY.

The new electric pumps to be installed on the 2150 level of the C. & C. shaft of the Con. Virginia M. Co. are expected next week. There are three of them—Reidler pattern, weighing, without the operating machinery, 260,000 pounds, and costing \$50,000. About Nov. 1 it is expected they will begin draining the mine down to its 2500 level, or bottom of the shaft. This will be an important point in the drainage of the Comstock, and other mines along the lode are expected to join in and assist, thereby getting at their own lower levels. The entire vertical depth of the workings of the Comstock is 3300 feet.

WASHOE COUNTY.

Supt. Parry has added twenty men to the working force of the Pacific Con. M. Co. at Pyramid.

Supt. J. W. Hopkins of the Great Western mine, near Reno, has fifteen miners developing the property.

J. K. Miller has handed the Boston group of mines, 110 acres, near Reno, at \$25,000. The property lies on the contact between the lime-porphry of the Wedekind district and the granite country rock.

WHITE PINE COUNTY.

The North Mountain M. Co., Cherry creek, is pushing work under the management of W. H. Brown.

Ely says that the Chairman Co. is now in debt to the extent of \$40,000 after expending \$500,000, which will occasion no surprise where the reasons for this condition are well known. The stockholders, however, should not be discouraged by the mistakes which have been made in the past. They have an excellent property.

Work on the railroad from Copper Flat has begun. The New York & Nevada C. Co. is grading for the new line.

Experiments by Mill Supt. Wickham in treating the Chairman ores have proven satisfactory; the six leaching tanks and two of the settling tanks above, capacity 150 tons each, are in use; assays of the tailings dumps show values of less than 75 cents.

NEW MEXICO.

The Steins Peak G. M. & M. Co. has incorporated; O. M. Segar, W. E. Allen and J. M. Abbott; headquarters, Lordsburg.

OREGON.

BAKER COUNTY.

Bourne reports strikes in the Cracker-Oregon property. Above the millsite the company intends to erect a plant for power and treatment.

The Crown Point owners have been making a resurvey of their property.

The Badger concentrating mill is completed.

W. H. Potter is putting in twenty new stamps at the quartz mill of the North Pole mine.

C. Feldenheimer, manager Pomeroy Dredger Co., on Burnt river, tells the Baker City Democrat that they will start the dredger to work.

Supt. Walker reports rich ore found in the crosscut of the California mine at Sumpter. Supt. Addoms has begun work on the Alpine group.

GRANITE COUNTY.

Near Granite piping for the Alamo mine is being laid. A slight error on the part of the engineer who made the survey for the tunnel has worked hardship on the management, as the tunnel was made to run almost parallel with the lead. This will necessitate over 400 feet more tunnel than was at first supposed. Ht Supt. McGuigan says he prefers that to making a bend in the tunnel.

JOSEPHINE COUNTY.

The Golden Drift M. Co. is damming Rogue river 3 miles above Grants Pass. The dam is built one-third of the distance across the river.

Many Josephine prospectors and miners are turning their attention towards platinum. The Welsbach Co. of Philadelphia has men in the placer fields of the Illinois river looking for that metal. They have patented machinery of their own design and hope to secure enough to partly supply the needs of their company.

SOUTH DAKOTA.

CLARK COUNTY.

F. R. Byrnes, general manager, is building a 40-stamp cyanide mill on the Penobscot, at Garden City.

PENNINGTON COUNTY.

W. Hendricks reports finding tellurium ore on the Enterprise claim, near Hill City.

The Columbia M. Co., near Rochford, will put in a new steam hoist, air compressor and machine drills.

At Keystone the Red Canyon Stucco Co. is organized to build and equip a large mill for grinding and calcining the native gypsum.

UTAH.

The State Board of Equalization furnishes the following valuation of some Utah mines for assessment purposes:

NET PROCEEDS OF MINES, 1902.

Utah Sulphur Co.	3,750
Pleasant Valley Coal Co.	53,236
Carisa Copper & Gold M. Co.	65,579

BEAVER COUNTY.

Construction work upon the power plant in Beaver canyon planned by the Majestic Co. has begun. W. M. White, the company engineer, says the approximate cost of the three dams will be \$50,000, designed to develop 1800 H. P. Dams Nos. 1 and 2 will be 290 feet long, 300 feet thick at the base, 10 feet thick at the top and 76 feet high. Dam No. 3 will be 144 feet thick at the base, 10 feet at the top and 36 feet high. President Lewis of the Majestic Co. says it is the intention to convey the current to Copper gulch, 50 miles, and furnish 500 H. P. to the Cactus, Manager Newhouse having contracted to take this amount of power for his mine and concentrator.

JUAB COUNTY.

The Tribune says both mine and mill at Tesora of Tintic have indefinitely closed down and will remain so until otherwise ordered by the Bingham Con. M. Co., which is now in possession of practically all the shares.

Water has compelled cessation of work in the South Swansea of Silver City.

O. Fairchild, superintendent Manhattan at Mammoth will cut out a station at the top of the 100-foot winze in the tunnel, preparatory to installing a hoist.

SUMMIT COUNTY.

(Special Correspondence)—At 11:30 last night the magazine on the 1200-foot level of the Daly-West mine exploded, killing twenty-nine miners in the Daly-West and six in the Ontario. Eight men got out through the Anchor tunnel. The cause of the explosion was J. Burgy, who went into the magazine with a lighted candle. His body was blown to pieces. The gas killed the others. The shock of the explosion was felt 4 miles away. It flung a horse against the wall of the mouth of the Ontario tunnel, 2 miles off, killing him. Considerable true bravery was shown by the rescuing party that was immediately organized. All the first crowd of rescuers were overcome by the gas, but were resuscitated, and the work of rescue went on until all who could be reached were

brought out and the bodies of all the dead procurable brought to the surface. Two of the rescuers—McLaughlin and Eckstrom—lost their lives saving others. The body of the latter was left in the mine.

The men who were brought out say that there was little smoke or fumes; that the deadly gas did not thicken the air, and that several did not realize that they were being suffocated.

Park City presents a mournful sight this morning, with the dead bodies laid out, and the bitter grief of the relatives and everybody in the place. All work in the mine is of course stopped until the deadly gas is cleared out.

This is the worst mining accident in Utah since the terrible loss of life at Schofield, which was a dust explosion.

Park City, July 16.

For 161 tons ore treated at the furnace of the American Co. at Murray, the Silver King of Park City got nearly \$27,500 net, an average of 270 ounces silver, 40% lead, 9% copper, \$18 gold per ton.

The new steel gallows-frame and tramway, which has been provided with a new cable, are in use at the Silver King, Park City.

The new mill on the property of the Sacramento Co., at Park City, has begun the precipitation of gold.

WASHINGTON.

KING COUNTY.

The United States-British Columbia Corporation has been formed in Seattle to mine coal, iron, copper and gold and to bore for petroleum in Washington, British Columbia and Alaska. The company is composed of Seattle and British Columbia men.

YAKIMA COUNTY.

At North Yakima, the Yakima Reduction Co. has incorporated and will put in a reduction plant.

WYOMING.

CARBON COUNTY.

J. C. Miller, president Ferris-Haggarty M. Co., says that hereafter the mine will be operated from the mouth of the tunnel. The concentrator will be a 500-ton plant and will be placed about 1 mile below the mouth of the tunnel. The estimated cost is about \$100,000. It will be run by electricity, the power plant being located at the coal banks, 15 miles distant. The company is under contract to deliver to the Tramway Co. 200 tons of ore each day and is getting ready to carry out its agreement. Forty men are employed at the mine. All the machinery, buildings and everything used at the shaft will be moved to the mouth of the tunnel and future operations conducted from that point.

FOREIGN.

BRITISH COLUMBIA.

Phoenix reports orders from J. P. Graves, general manager Granby Con. M., S. & P. Co., to close the company's mines there. Over 400 men are affected by this order to close. The Granby smelter has not blown in since it closed for the Dominion day holiday, and 250 men are affected there. This is the first time in five years that these mines have closed. Lack of coke at the company's smelter is the cause of the cessation of operations at mines and smelter, which is occasioned by the strike at the Fernie mines of the Crow's Nest Coal Co. The officials of the mines are in hopes that the strike at Fernie will shortly be adjusted, so that work can be resumed at an early date. No ore is being sent out from the Mother Lode mine, in Deadwood camp, which is closed, and that company's Greenwood smelter is also blown out. The smelter at Boundary Falls is still running, and has a supply of coke sufficient to last another week, when it also will be forced to close if no more coke is obtainable. The Sunset and Snowshoe mines, which ship to this smelter, are still running as usual, and the latter is expected to continue anyway, as there is a large amount of development in hand, aside from the shipping of ore.

The Cariboo Hydraulic Co. has sent part of its cleanup to the bank at Ashcroft. The company used to ship its gold to New York, but has decided to forward the gold to Vancouver. By this means it receives the same price as New York would give and saves freight and other charges.

The Velvet mine at Rossland is to have a concentrating plant. The management expects to ultimately have 250 men employed.

D. H. Wilcox, foreman Prince M. Co., in Revelstoke, says that they have a body of 6 feet of ore carrying copper, silver and gold.

Manager E. B. Kirby says the Center Star and the War Eagle at Rossland will soon be shipping again on about the same basis as before the strike of last year. When production stopped the War Eagle

was sending out about 150 tons of ore a day and the Center Star about 300 tons. The lowest cost the Center Star was able to maintain for mining its ore was a little over \$2.50 a ton. Of that, \$1.44 was charged against development.

At Marysville G. W. Hull, general manager Sullivan Group M. Co., is pushing work on the smelter. The Sullivan mine will be opened up.

At the Arlington mine, Slocan, the force may be further reduced. The management is endeavoring to secure better rates from the Hall Mines smelter for the treatment of its ore, claiming that the present charges are excessive.

It is locally stated that the North Star mine, East Kootenay, had to pay \$101,336 17 for the freight and treatment of \$164 838 72 worth of ore. The total expense of mining, maintenance, freight and treatment exceeded the gross value of the ore extracted by \$76 21. Miscellaneous receipts, however, allowed a small profit of \$8701 97.

The Lenora mine is stated to be shipping 200 tons of ore daily to the Crofton smelter, which begins work next month.

The Northwestern Development Syndicate, Hancock, Mich., will put in a 10-stamp mill and an aerial tramway at the mines of the Camborne group. A sawmill will also be erected for the mines and the adjacent town of Goldfields. The Gold Finch claim adjoining is bought by the syndicate for \$25,000.

The Cariboo Con. hydraulic mine at Bullion is running with a full force of men.

Manager Hull has shut down the Marysville smelter, East Kootenay. At the North Star mine, East Kootenay, there are seventy men employed.

The Montreal & Boston Copper Co.'s reconstructed smelter at Boundary Falls is in operation.

The Glenn iron mine is at Cherry Bluff, near Kamloops. The product of this mine is 66 83% metallic iron, the annual output from 500 to 2000 tons conveyed by aerial tramway to the C. P. R. tracks. This ore has been used for fluxing purposes by smelters at Tacoma, Revelstoke and Nelson.

CHINA.

From Niu Chwang Consul H. B. Miller writes that there are no quartz mines in operation in Manchuria, excepting those operated by the Chinese with their own methods, which consist in roasting the ore, grinding and then washing it. This is carried on in a very rude way with both silver and gold; but all the appliances are so crude as to indicate little as to the value of the mines. Nothing has been done except incidental prospecting. Mining in the immediate vicinity of Port Arthur can only be carried on by permission of the Russian Government.

All of Manchuria, from Port Arthur north to Siberia, is mineralized; gold, silver, copper, iron, asbestos, anthracite and bituminous coal have been discovered and worked by the natives.

Gold placers have been worked for ages on the waters of the Yalu and Sungari rivers, and are still operated in very crude ways, without pipes, giants or water pressure.

Gold and silver quartz have been hammered out and roasted in mines in these sections for forty years or more, but no reliable prospecting has yet been done, and foreign mining experts have never given the country even casual investigation.

Consul Miller says he has met and interviewed several Chinese, who are operating mines on the headwaters of the Yalu, who tell him that many quartz ledges carrying gold have been discovered and worked in a crude way without the use of drills and powder, and that from the richest they secured \$250 to the ton.

The Chinese government has recently issued a new set of mining regulations that will have a tendency to retard rather than increase mining in China.

An Anglo-French syndicate, registered in London, and represented in China by E. Roebber, the French Consul General, has secured a mining concession in the province of Yunnan. The contract has been signed by the British and French ministers. The concession runs for sixty years, with the right of further extension. It comprises eighty-five mines producing coal, copper, nickel, quicksilver, and tin. A royalty of 5% is to be paid to the Chinese government. Twenty-five per cent of the net profits will also go to the Chinese government, 10% to the provincial government and 65% to the shareholders. The concession includes buildings, mines, railroads, roads and canals.

MEXICO.

SONORA.

W. E. Pomeroy, Supt. Yaqui Copper Co.'s mines, W. C. Greene president, W. P. Harlow general manager, at Saquai de Batuc, on the Yaqui river, 125 miles from Hermosillo, says there are eight tunnels,

two shafts and numerous crosscuts. He has ninety men employed and is under instruction to put more on as fast as room can be made for them.

The Anglo-American Co. that lately bought the Mulatos group is preparing to build a 1000-ton smelting plant. An appropriation of \$300,000 has been made by the company to build a road from the smelter, near the mines, to the nearest point on the Sonora Railway.

The Green Con. at La Cananea has three converters at work. The company is shipping at the rate of 3,000,000 pounds of blister copper a month, equivalent to about 6,000,000 pounds of matte, as the Cananea matte did not go more than 50% copper.

A. W. Burchard, manager Greene Consolidated, is locally credited with the statement that the company has in one month reduced the cost of producing one pound of refined copper from 7 1/10 cents to 6 1/10 cents.

The Cananea Co. is producing copper at the rate of 1,000,000 pounds per month. Five furnaces and three converters are in operation; three new furnaces and two converters are being erected. Work has begun on a 500-ton concentrating plant.

NORWAY.

The Edison magnetic ore extraction process is to be installed by English steel manufacturers in the iron ore districts of Norway. Arrangements have now been completed for the erection of a complete magnetic apparatus at Dunderland. In this district there are deposits of iron ore averaging 40% of metal to 60% of gangue. It would not be lucrative to ship the raw ore to the smelting furnaces of England, but it will be possible to work the ore profitably by the Edison extraction process. Each unit of the apparatus contains two 250 magnets of varying powers, and is capable of dealing with a ton and a half of crushed ore per hour.

SUMATRA.

W. D. O'Brien has returned to San Francisco from the island of Sumatra, where he was in the employ of a Dutch mining company that is putting in hydraulic mining machinery. He says the gold is found in the quartz. There is plenty of water power on the island. Rain falls throughout the year. The interior is covered with a high range of mountains and there are ample facilities for water storage. For this reason hydraulic mines may be found in large numbers. Quartz mines in certain localities have ore yielding \$36 per ton. The process of operation is difficult on account of the lack of desirable laborers. Chinese coolies are imported, who are paid 10 cents per day and found. The white population of the whole island is less than 500.

YUKON TERRITORY.

Now that the Yukon gold royalty has been reduced to 2 1/2%, there is no longer exemption allowed up to \$25,000 of output in the case of hydraulic properties.

Personal.

JULES LA BARTHE is Supt. Trail, B. C., smelter.

W. L. WATTS is examining property in Sierra Co., Cal.

T. H. WILKINS is manager Cedar Creek mine, Colfax, Cal.

E. M. RAY of Colorado is visiting Thunder Mountain, Idaho.

J. F. KEMP of Columbia College, is visiting Park City, Utah.

S. M. NOEL is superintendent San Juan M. Co., Silverton, Colo.

J. W. DUNLAP is Supt. Basin Con. gravel mine, Deadwood, Cal.

V. V. CLARK has gone from Albuquerque to Woodbury, N. M.

A. H. WETHEY, Supt. Butte, Mont., Reduction Works, is in Chicago.

J. H. TERRY, manager Sunnyside mine, has returned there from Denver.

J. WITHERLAY is superintendent Socorro mine, Wickenburg, Arizona.

JOHN MOLDER has been re-elected Supt. Home Copper Co., Morenci, Ariz.

FRANCIS WATSON is general manager The Fisher Maiden mine, Rossland, B. C.

W. G. FOSS is general manager Wisconsin M. Co., Grand Encampment, Wyo.

PATRICK CLARK has again resumed management of the Republic, Wash., M. Co.

P. T. NEWITT has been appointed Supt. Henson Creek L. M. Co., Lake City, Colo.

H. W. BRITT is resident manager the Copper Age M. & S. Co., Encampment, Wyoming.

G. R. NICKETY, manager Britannia mine, Butte, Mont., has returned from Wisconsin.

GEORGE M. SEELEY has resigned the superintendency of the Irondale Lead Co., Irondale, Mo.

W. J. ELMENDORF, of Denver, is appointed superintendent Sullivan smelter, Marysville, B. C.

SUPT. E. R. ABADIE of the Champion mine has returned from San Francisco to Grass Valley, Cal.

F. MOREHOUSE is manager Lady Curzon group, owned by the Beaver C. & G. Co., Milford, Utah.

D. G. C. MACNEILL has returned to Colorado from a nine months' stay in Guanajuato, Mexico.

W. B. McDONALD, the new manager of the Arkansas Valley smelter, Leadville, Colo., has taken charge.

R. H. CAMPBELL, formerly of Shasta Co., Cal., is examining placer property at Eureka and Fraser creeks, B. C.

SUPT. N. S. BERRY of the United Globe mines has returned to Globe, Arizona, from Grant county, N. M.

W. L. ROBB has been elected professor of physics and electrical engineering at the Rensselaer Polytechnic Institute.

DR. JNO. H. TUCKER has resigned the superintendency of the Germania smelter, Salt Lake, Utah, because of ill health.

ELL TORRANCE of Minneapolis, Minn., writes that he is a director and stockholder in the Feather River Con. M. Co.

J. R. GIFFORD is general manager Hall mines, Nelson, B. C., and consulting engineer Highlander mine, Ainsworth, B. C.

JOHN ROSS is now general foreman of the Creston mine at Minas Prietas, Sonora, Mexico, succeeding Thos. Bentley.

J. P. EVANS and BRUCE TRAYLOR of the Colorado Iron Works Co., have returned from San Francisco to Denver, Colo.

ERNEST GAYFORD, late Supt. Horsehoe, Nev., mill and mine, goes as metallurgist Colossus G. M. Co., Charlotte, N. C.

ROBERT J. COLEMAN, manager Newhouse properties, has returned to Salt Lake, Utah, from Tintic, and goes thence to Mexico.

ASA BALDWIN has resigned the superintendency of the Ohio-Deadwood Co., Lead, S. D. His successor is I. P. Murphy of Toledo, O.

W. F. STAUNTON, Supt. Congress, Arizona, gold mines, will assume the superintendency of the Tombstone Con. mines, Tombstone, Arizona.

A. C. SPENCER is in charge of the Government geological work, Grand Encampment, Wyoming, under the general direction of S. F. Emmons.

J. J. SHINN has been appointed general manager Stormy Petrel M. & M. Co., Horseshoe mining district, Park county, 8 miles from Leadville, Colo.

GEORGE GUNN, for many years buyer of ore for the East Helena, Mont., smelter, has gone to Salt Lake City, Utah, to take a similar position.

WALLACE MCGREGOR returned to Berkeley, Cal., from a year's sojourn at Costa Rica mines on the 13th, and left on the 16th for East Braintree, Mass.

T. R. JONES will be succeeded in the Utah management of the American Smelting & Refining Co. Aug. 1 by Chas. W. Whitley of East Helena, Montana.

E. A. COLBURN is president and general manager; H. C. Colburn, master mechanic; C. H. Dudley, secretary and treasurer, Ajax G. M. Co., Victor, Colo.

H. M. CLAGETT, formerly Supt. at Vacas, Durango, Mexico, has been appointed Supt. of the mill and smelter of the Pride of the West M. & M. Co. at Washington, Ariz.

HENRY BRADY, melter of the United States Mint, Denver, Colo., since 1897, has resigned. It is understood that J. W. Milsom of Canon City, Colo., will be appointed his successor.

R. B. MCCONNEY, mechanical engineer, for several years with the Mine & Smelter Supply Co. of Denver, Colo., has resigned his position with the above firm and accepted a similar one with the Holthoff Machinery Co. of Milwaukee.

THOMAS MILLS, connected with the Calumet & Hecla for many years before the consolidation, and who has been underground captain since 1872, has retired on account of the state of his health. He has been succeeded by James Wilson, his former assistant.

WALTER VROOMAN, of Missouri and Kansas, has a plan to "formulate a Colorado branch, purchase and develop mines, erect a smelter for the treatment of the ores and also to buy and establish co-operative stores" in Colorado, and will begin work in Colorado, he says, about Sept. 1.

L. WEATHERHEAD, of Missoula, Mon-

tana, has returned to South Africa. He says that Americans are numerous there and that American machinery and American operatives are in demand. He does not think that British rule will improve conditions, but is going back just the same.

J. B. GALLAGHER, late superintendent sampling mill at Washoe smelter, Anaconda, Montana, is now in charge of the Colorado smelter, owned by the Anaconda Co. in Butte, succeeding R. F. Pierce, who resigned to take a position in the New York office of the Colorado M. Co. S. A. Gormerly succeeds Mr. Gallagher as superintendent of the sampling mill.

Commercial Paragraphs.

THE Burt Mfg. Co. of Akron, Ohio, have furnished two large Cross oil filters to the U. S. Steel Corporation for their works at Youngstown, Ohio, making 108 of their filters now in use by that company.

AT the air drilling contests at Idaho Springs, Colo., during the week ending the 7th inst., the Leyner drill was used by the teams who won the first and second prizes, the first prize winners putting one 9-foot down and one 9-foot upper into the granite wall in 42 1/2 minutes, the second prize winners drilling the same in 44 1/2 minutes.

THE Sturtevant Mill Co. of Boston write that owing to the increased demand for its output they have greatly enlarged their plant, which includes a large Green engine, latest high speed lathes, boring mills, planers, shapers, etc., enabling them to offer to their patrons a better service than ever before. Their thoroughly equipped wood working shop is exclusively adapted to the manufacture of their toggle screens, the demand for which has increased so rapidly that their new works are just beginning to fill orders secured in the early spring. They say that by the middle of summer they will be able to make quick deliveries on nearly all their productions. One of the novel features of their plant is its sampling department. The company have found that working tests on varying material often saves a great expense to prospective purchasers, as the exact results there attained assure the buyer of just what each machine will do when working for him. This plant is seldom out of use. They say: "Our patrons are cordially invited to make use of this sampling plant."

THE A. Van der Naillen School of Engineering, 113 Fulton street, San Francisco, Cal., recently held its thirty-eighth annual examination in practical, civil, mining, electrical and mechanical engineering and surveying, architecture, drawing, assaying, cyaniding and metallurgy. The following were granted diplomas: Assayers—H. A. Kuns, D. Woodrun, H. B. Shaw, C. S. Bryant, H. C. Gentesche, W. T. James, C. L. Bosson, F. G. Blackburn, J. K. Wilson, F. S. Beckett, G. Messner, W. W. Thurston, T. J. Douglass, J. Sklower, R. Mawbray, C. W. Soule, D. J. Mahoney, L. L. Mann, G. R. Huggins, E. Williams, G. Conlin. Surveyors—G. Gibson, M. J. Blake, G. W. Grove, G. J. Grinnell, G. V. Nichols, A. E. Duffey, R. J. Barr, C. Goerl, F. Juhl, U. Coffman, R. C. MacLachlan, A. Watson, A. Dumas, W. H. Warnecke. Mining Department—G. A. Ray, S. M. Waterman, F. A. Horville, J. L. Hutchinson, H. Newman, M. C. Kerr, F. M. Lyle, D. W. Lyon, W. H. James, J. A. Shields, C. E. Sloan, B. G. B. McDowell, J. H. McDowell, W. O. Maxwell, E. F. Beck, O. W. Alderton, F. W. Saunders. Draughtsmen—R. Keeler, G. Fee, R. W. Cudworth, W. K. Blackburn, S. I. Casella, J. F. McLaughlin. Electrical Department—W. R. Dunbar, H. E. Shuck, T. J. Zehmdner, P. L. Gedney, D. McDougall, W. T. Rutledge, R. Dewart, E. L. Faust, A. W. Hunt, V. Urban, H. G. Schemel, A. Mauser, J. W. Dooley, F. A. Dooley, A. H. Kennedy, C. W. Cooper, T. C. Thayer, H. B. Patterson, R. Urquhart, C. T. McKenzie, H. A. Smith, J. T. Worthington, F. W. Mielenz, F. Bond, F. R. George, E. Kreft, R. L. Cathy, E. R. Foster, E. Schlesinger, L. A. Hedger, J. Minor, J. P. Gericke, H. F. Fahs, E. P. Mann, O. G. Wilkes, L. E. Wilkes, E. Mayer, L. T. Russell, S. C. Mills, E. M. Hengell, H. Piggott, J. F. Echer, D. C. Rudolph.

THE Denver Engineering Works Co. of Denver, Colo., has in process of construction a 10-stamp mill for R. B. Pratt, to be erected at Thomasville, Colo.; also a 40-stamp mill for the Penobscot M. Co., to be erected at Deadwood, S. D. Electric hoists under construction are as follows: Three 2 H. P. hoists, two 5 H. P. hoists, two hoists of 10,000 pounds capacity, and two 150 H. P. hoists for the Penoles mine in old Mexico; one 135 H. P. hoist for the Utah Fuel Co.; one 50 H. P. hoist for the Kendall G. M. Co., Montana; one special

50 H. P. hoist for the Montana Coal & Coke Co., Montana; one 50 H. P. hoist for the Northern Pacific Railroad Co.; one 5 H. P. hoist for Hendrie & Boltboff; one 5 H. P. hoist for the Mine & Smelter Supply Co.; one 100 H. P. endless cable, electrically driven winding engine for the Anaconda Copper M. Co. They also have one order for 300 tons of special castings for the Colorado Fuel & Iron Co., and another order for 30,000 pounds of castings for the new rolling mill to be erected at the Bessemer Steel Works. They write: "We have also recently shipped one set of 16x36 spring rolls and two sets new type 14x27 rigid rolls to the Columbus Skein & Iron Works, Columbus, Ohio; one complete mine timber framing plant, comprising timber framer, slab saw, wedge saw, swing cut-off saw, and automatic saw sharpening machines to the Allis-Chalmers Co., Chicago; one 25 H. P. electric hoist to the Candelaria M. Co., Mexico; one 15 H. P. hoist to Harron, Rickard & McCone, San Francisco; two complete sets of riveted steel jackets to the Birmingham C. & G. M. Co., Utah; thirty special butterfly valves to the United States M. Co., Utah; one 4x6 and one 9x10 steam hoist to Van Voorhies & Sanford, Mexico; one 5 and one 7 1/2 H. P. electric hoist to Parral, Mexico; one 3 H. P. induction motor to the Gold King Con. M. Co., Silverton, Colo.; three 8-foot flat rope sheaves for 4 inch and 5-inch ropes to the American Bridge Co.; one 135 H. P. electric hoist to the Commodore M. Co. We shall soon have ready for distribution our new electric hoist bulletin of thirty pages, illustrated, containing construction drawings of all the standard hoists; also our new electric rock drill bulletin will be ready for distribution Aug. 1st."

Catalogues Received.

The paramount excellence now expected in American machinery catalogues is fully sustained by General Catalogue No. 42 of the Stilwell-Bierce & Smith-Vaile Co., Dayton, Ohio, depicting in detail their pumping machinery. The 136 pages are interesting to any one in present or prospective use of such devices. The company will send the catalogue on request.

Roasting, smelting and refining are the main subjects treated in the 6th edition of Catalogue No. 5, issued in their usual sumptuous style by the Allis-Chalmers Co., Chicago, Ill. No finer work, typographically, is found in any of the high-class magazines, and the technical information and detail make the handsomely bound volume of 208 pages worthy a place on the shelf of anyone interested in the subjects treated.

Obituary.

HENRY WILLIAMS, a leading Montana smelting man, died at Butte, Mont., on the 8th inst., aged 62 years.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

- FOR THE WEEK ENDING JULY 8, 1902
- 704,289.—BELL—S. J. Ashell, Deerharbor, Wash.
 704,438.—SASH FASTENER—A. Brander, Seattle, Wash.
 704,172.—INSULATOR—J. E. Calvin, Camptonville, Cal.
 704,173.—CAN BONY MACHINE—W. S. Case, Haywards, Cal.
 703,995.—GAS GENERATOR—Caton & Warring, San Jose, Cal.
 704,416.—ENDLESS CHAIN REEL—J. M. Dunaboo, Wood River, Cal.
 704,015.—SEMAPHORE—W. D. Farren, Danville, Cal.
 704,181.—BUILDING DAMS—A. D. Foote, Grass Valley, Cal.
 704,331.—TREE SUPPORT—S. T. Hall, Riverside, Cal.
 704,350.—WELL RIG—E. A. Hardison, Santa Paula, Cal.
 704,180.—HAND STAMP—L. J. Hendershott, Spokane, Wash.
 704,061.—HORSE HOLDING DEVICE—M. Lopicich, Sacramento, Cal.
 704,092.—AMMONIA COMPRESSOR—J. T. Ludlow, S. F.
 704,065.—WEIGHING APPARATUS—J. Manes, S. F.
 704,085.—CAR AXLE BOX—O. Newhouse, S. F.
 704,363.—SWITCH STAND—H. F. Ong, Wendling, Or.
 704,314.—ACCOUNT BOOK—C. K. Rosenberg, S. F.
 704,123.—LAIDDER—R. L. Scott, Arlington, Cal.
 704,129.—DELIVERY APPARATUS—Speedy & Campbell, Los Angeles, Cal.
 704,130.—CIRCULATOR—Speedy & Campbell, Los Angeles, Cal.
 704,137.—SEWING MACHINE—D. M. Smythe, Pasadena, Cal.
 704,280.—ROTARY ENGINE—A. T. Stimson, Eureka, Cal.
 704,405.—WATER WHEEL—S. M. Thurman, Yuma, Ariz.

Latest Market Reports.

SAN FRANCISCO, July 18, 1902.

METALS.

SILVER.—Per oz., Troy: London, 24 1/2 (standard ounce, 925 fine); New York, bar silver, 53c, refined (1000 fine); San Francisco, 53c; Mexican dollars, 44 1/2c San Francisco, 45c New York.

COPPER.—New York: Standard, \$11.40@11.65; Lake, 1 to 3 casks, \$11.95; carload lots, \$12.15; Electrolytic, 1 to 3 casks, \$11.95; carload lots, \$11.60; Casting, 1 to 3 casks, \$11.75; carload lots, \$11.50. San Francisco: \$11.00. Mill copper plates, \$17.00; bars, 18@24c. London: £53 2s 6d spot, per ton.

LEAD.—New York, \$4.12 1/2; Salt Lake City, \$3.60; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4 1/2c 1000 to 4000 lbs.; pipe 5 1/2, sheet 6, bar 5 1/2c; pig, \$4.75. London: £11 5s per ton.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6 1/2c; 1 ton and less than 5 tons, per lb., 6 1/2c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7 1/2c; in 25-lb. tin pails, 4c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2 1/2c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6c; do. in kegs, 6 1/2c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7 1/2c; less than 500 lbs., 7 1/2c.

ASSAY LITHARGE.—Per lb., 8 1/2c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c per lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, 30c, 60c.

MAGNESIUM.—Per lb., \$3.00.

MANGANESE.—(90% and over) per lb., \$1.25.

MERCURY.—Bichloride, per lb., 90c.

MOLYBDENUM.—25c per gramme; 1000 grammes—2 1/2 lbs.

PHOSPHORUS.—(American) per lb., 80c.

SILVER.—Chloride, per oz., 75c; nitrate, 55c.

SODIUM.—Metal, per lb., \$1.00.

URANIUM.—Oxide, per lb., \$3.50.

ZINC.—Metallic, chemically pure, per lb., 50c.

ZINC.—Dust, per lb., 10c.

ZINC.—Sulphate, per lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HORSE HOLDING DEVICE.—No. 704,661. July 9, 1902. M. Lopicich, Sacramento, Cal. This invention relates to a device which is designed to hold horses and prevent running and similar accidents. It consists of a shaft revolvably and movably supported parallel with the rear axle of a vehicle, having gears adapted to engage with similar gears upon the wheel hubs, springs by which said gears are normally held in mesh, and a lever mechanism by which the gears may be disengaged to throw the apparatus out of use. Straps or cords are wound upon this shaft extending forward beneath the bottom of the vehicle, and one set of said straps is detachably connected with others which pass through guides upon the tugs or traces and returning thence are connected with the breeching of the harness, while the other set is in like manner detachably connected with the driving reins.

METHOD OF BUILDING DAMS.—No. 704,181. July 8, 1902. A. D. Foote, Grass Valley, Cal. This invention relates to a method of building dams of rock, gravel, sand, and finer material. It consists in the separation of a mass of material into larger rock or cobbles, smaller gravel, sand, earth, and silt and in depositing them successively so as to form, first, the front, then a layer of

finer material, then a deposit of silt or fine material upon the inner back surface of the dam, whereby it is made tight and strong and with a minimum amount of labor.

CAN BONY FORMING MACHINE.—No. 704,173. July 8, 1902. W. S. Case, Haywards, Cal., one-half assigned to J. H. Hunt, Oakland, Cal. This invention consists in the combination in one body forming machine of an endless traveling carrier, composed of flexibly connected tables adapted to receive and advance the blanks, jaws binged beneath the upper surface of said tables, mechanism by which said jaws are closed and a blank folded during the forward movement of the carrier. A horn is located above the carrier, having a groove in its top, about which horn the jaws fold the blank, with one edge in advance of the other and overlapping the groove. A wheel is journaled above the horn so that its periphery acts to bend the overlapping edges of the blank into the groove, and there is a pressure plate or bar, beneath which the partially undressed edge passes after leaving the roller, and a roller journaled above the terminal end of the groove whereby the interlocked seams is compressed and finished.

INSULATORS.—No. 704,172. July 8, 1902. J. E. Calvin, Camptonville, Cal., one-half assigned to E. C. Cochran, same place. The object of this invention is to provide a simple device whereby the conductor of an insulator may be quickly engaged or released without the use of the customary tie wires. It consists of a base, a cylindrical screw-threaded stem thereon, an annular shoulder on said base, said stem having a slot adapted to receive a conductor, and said shoulder having grooves coincident with said slot, so that the conductor is maintained and supported in an essentially straight line. A screw cap fits over said stem and has corrugations on its edge in which the conductor is adapted to seat and prevent the cap from unscrewing.

SITUATIONS WANTED.

An Electrical Engineer would like a position on some power plant in Arizona, New Mexico or Mexico. Thoroughly practical; twenty years' experience: sober. Experienced in telephone, telegraph, electric light, railway and power work. Repairs at mines. Good letters. Give particulars. Box 713, Riverside, Cal.

Practical and technical mine superintendent ten years' experience in Pacific Coast mines. Assayer, millman and construction engineer. Local references. Address "Mineral," care this office.

WANTED.—Position as Assayer and Bookkeeper in a mine; experienced in underground work; good references; present position not desirable. Address Box No. 127, care of this office.

WANTED.—Position by a technical graduate. Am an experienced stamp and cyanide millman, good assayer and chemist. U. S. deputy mineral surveyor. Can handle any kind of a mill or mine. Address Technical, care of this office.

ASSAYER. familiar with cyanide practice, desires position as assayer, or in some capacity, in cyanide plant. Address X, care of Mining and Scientific Press.

PRACTICAL MILLMAN—AMALGAMATOR. Cyanide Man and Assayer, wishes position. School of Mines graduate. Best references. Address R. B., care of Mining and Scientific Press.

Cyanide and Stamp Mill Superintendent open for engagement after September 1st. Graduate. A thorough assayer and chemist; also accountant. Speaks Spanish. Will go anywhere. Specialty, construction; also successful treatment of low-grade and slimy ores. References "A. I." Address Practical, care of Mining and Scientific Press.

A technically educated Mining Engineer, at present employed as superintendent of mines for one of the largest corporations in Mexico, desires a change of position to the United States about July 1st. Has had 18 years' successful experience as engineer and superintendent, never having made a failure; 36 years of age; strictly temperate; a skilled designer, geologist and metallurgist, and a practical miner, as well as a hard worker and thorough business man. References of the highest order, including present employers. Address Supt., care this office.

WANTED.

EXPERIENCED METALLURGICAL ENGINEER would furnish and erect mill or reduction works on developed, payable gold or copper mine. Must be first-class proposition. Replies will please state full particulars. None but principals negotiated with. Address "Reduction," this office.

WANTED.—A party thoroughly posted in mining who can sell mining stock in a reliable company developing its property in Idaho. References required. Address Hoosier Mining Company, Marion, Indiana.

WANTED.—BY TWO ENERGETIC AND EXPERIENCED mining men the acquaintance of persons interested in the development of mining property in old Mexico. Address D. L. C., care of this office.

Wanted to Bond a Dry Placer Claim, One Rich in Flour Gold.

Must be a dry proposition. Address "Placer Claim," care this office.

WANTED.

Consulting Mining Engineer, familiar with making examinations of mines, prospects and mineral lands. Address stating experience and references. Moderate salary to start, with advancement to competent man. Position permanent if found satisfactory. Address A., care of Mining and Scientific Press.

THE large advertisement inspires confidence because it indicates the advertiser's faith in the fact that he has something worth advertising largely.

FOR SALE.

CALIFORNIA RICH GRAVEL GOLD MINE.

Equipped with buildings, tools, etc.
Lower tunnel now running. No prospect.
Small amount of treasury stock for sale to complete the same.

Best of reports by leading experts.
Land patented. No encumbrance.
This is a snap. Write for prospectus.

E. S. ARMSTRONG,
Room 313 Chamber of Commerce Bldg., Chicago.

Gold Mining Properties
For Sale.

Two First-Class Placer Mines,
one having 20 years' record as a producer. Both in
good working condition. Terms reasonable.

Francisco, California; location of works, Calaveras
County, California.

Notice is hereby given that, at a meeting of the
Board of Directors, held on the 10th day of July,
1902, an assessment (No. 6) of three cents per share
was levied upon the capital stock of the corporation,
payable immediately in United States gold
coin to the secretary, Edward H. Stearns, at his
office, Room 405 of the Claus Spreckle Building,
Cor. Third and Market Sts., San Francisco, California.

Any stock upon which this assessment shall remain
unpaid on the 19th day of August, 1902, will be
delinquent, and advertised for sale at public
auction; and unless payment is made before, will be
sold on TUESDAY, the 19th day of September, 1902,
to pay the delinquent assessment, together with the
costs of advertising and expenses of sale.
By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.

Office of the Company—Head's Business College,
24 Post St., San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business,
San Francisco, California; location of works, Sunny
Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the
Board of Directors, held on the 16th day of July,
1902, an assessment (No. 30) of five (5) cents per
share was levied upon the capital stock of the corporation,
payable immediately in United States
gold coin to the secretary, at the office of the company,
415 Front street, San Francisco, California.

Any stock upon which this assessment shall remain
unpaid on the 19th day of August, 1902, will be
delinquent, and advertised for sale at public
auction; and unless payment is made before, will be
sold on MONDAY, the 8th day of September,
1902, to pay the delinquent assessment, together
with the costs of advertising and expenses of sale.
By order of the Board of Directors.

CHAS. BOVONE, Secretary.

Office—415 Front street, San Francisco, California

WILLIETTA MINING AND MILLING COMPANY.—Location of principal place of business, San
Francisco, California; location of works, near
Jacksonville, Tuolumne County, California.

Notice is hereby given, that at a meeting of the
Board of Directors, held on the 20th day of June,
1902, an assessment (No. 4) of one (1) cent per
share was levied upon the capital stock of the corporation,
payable immediately in United States
gold coin to the secretary, at the office of the company,
Room 233 Crocker Building, corner of Post
and Market streets, San Francisco, California.

Any stock upon which this assessment shall remain
unpaid on Monday, the 4th day of August, 1902,
will be delinquent and advertised for sale at public
auction; and unless payment is made before, will be
sold on TUESDAY, the 2d day of September, 1902, to
pay the delinquent assessment, together with the
costs of advertising and expenses of sale.

By order of the Board of Directors.

B. McALLISTER, Secretary.

Office—Room 233 Crocker Building, corner of Post
and Market streets, San Francisco, California.

Coking Plant at Tercio, Colo.

We are indebted to F. M. Drescher, E. M., Denver, Colo., for the following description of the coking plant being erected by the Colorado Fuel & Iron Co. of Denver, Colo., at Tercio, Colo.:

The formation is Larimie Cretaceous which has been tilted to an angle of about 45° and contains innumerable veins and seams of coal. The veins vary in thickness from 3 to 8 feet. The strike of the veins varies from north 35° west to north 45° west. The coal is mined through tunnels and overhead stopes, being loaded into cars from chutes as is customary in metal mining. There are at present six openings being worked, the same system of development being pursued in all openings. The coal is transferred to the mouth of the tunnel by mule power and thence to the tipples by small jacket boiler locomotive.

From No. 2 north mine the coal is dropped on an incline plane or gravity tram, the loads pulling the empties up, and transferring from sixteen to twenty tons to a trip. This incline is 1400 feet long and the base is within 900 feet of the north tippie. The coal is automatically dumped at the tippie, the lump coal being separated preparatory to shipping, and the fine coal and slack being transferred by flights into the storage bin. This bin is 220 feet long by 24 feet wide. From the bin the coal is elevated to the top of the washery. This washery is a coal concentrator. The coal is crushed and sized, all particles of pyrities and waste being separated out.

From the washery the coal goes to the Larry bin or washed coal bin, whence it is loaded into cars and transferred to the upper ends of the ovens and drops by gravity to the required point in charging. The ovens are built in batteries of 300 each, 150 on a side, the total length of each battery being 2400 feet. From top of rail to top of ovens is about 21 feet and each battery is 31 feet wide. One battery is nearly completed, another in process of construction, and two more are projected. These batteries are built to suit the lay of the country.

The ovens are built on a 2% grade to facilitate the charging. The beehive type of ovens is employed, each oven burning about seven tons of coal per twenty-four hours. There is a 12-foot wharf along the face of the ovens which is 10 feet above the top of rail. The coke after being removed from the ovens is loaded directly into the cars from the wharf. The ovens are built of firebrick on a foundation of white sandstone, which is quarried on the ground.

The water supply is taken from a reservoir which is supplied from the Purgatoire creek by a 16-inch wooden stave pipe line. The reservoir is 100 feet square, 10 feet deep, having sides slope one to one. There is 6 inches of concrete on sides and bottom with a 1-inch coating of cement. This reservoir supplies water for the ovens, washery and the town.

That is an unlikely story from Tuolumne county, Cal., that the deepest mine in that county is to be closed down because its depth involves too costly machinery for the ore to pay. The mine in question—the Dead Horse—is only 1700 feet in its deepest workings, and the ore is of the same general nature as that in other properties along that main lode that are being profitably worked to a depth of from 1800 to 2500 feet. Doubtless the real reason has not transpired, but with present hoisting appliances and

economical management it should and would cost less to hoist from 2000 feet than it did to hoist from 200 feet when that particular mine was first opened up.

THE successful transmission with commercial profit of 60,000 volts 150 miles, as narrated in the issues of June 21 and 28, reminds an old electrical engineer of the fearful forebodings indulged in by some electricians but a few years ago in pronouncing as absolutely impossible the proposed transmission of 20,000 volts 40 miles. It illustrates that in electrical progress, as in other branches of engineering, that which is impossible is merely some stage of advance that at that particular moment had not been made possible.

Force of Explosives.

Last week's disastrous explosion of dynamite on the 1200-foot level of the Daly-West mine, Park City, Utah, by which thirty-five unfortunate miners lost their lives, presents the usual features of stupendous force manifested, horses having been killed at the mouth of a tunnel two miles from the spot where the explosion occurred.

The matter has already been treated in these columns, but a few remarks on explosives in general are in order.

An explosive is a body which contains within itself the elements necessary to produce, by new combinations, a large amount of heat, and at the same time changes from a solid or liquid to a gaseous state, unless, as is sometimes the case, the explosive is itself gaseous, when the force of explosion is due entirely to the evolution of heat and the consequent expansion due to it.

The most powerful explosives are those possessing the greatest specific gravity or the greatest weight within the smallest volume, compared with the volume of heated gases evolved when exploded. One frequently hears of some one having invented a new and wonderful high explosive, many times more powerful than the strongest dynamite, but upon investigation, it is learned that the substance is, after all, no more powerful or wonderful than has long been known to science. The force of an explosive is limited, because, as stated, its power depends entirely upon the relative value of its gaseous products when expanded under the heat produced by the reaction of decomposition compared with the

original volume of the explosive before detonation.

Among the most powerful explosives known are nitro-glycerine, nitro-gelatine, No. 1 dynamite, and picric acid and its compounds. These have a specific gravity ranging from 1.6 to 1.7, and it is estimated that upon detonation they are capable of setting free a sufficient volume of gases and at a sufficiently high temperature to produce, under atmospheric pressure, something like 10,000

to 15,000 times the original volume of the material. This represents a pressure of from 250,000 to 350,000 pounds to the square inch. Detonation means the conversion of the body into gases by a wave action, and the speed of this wave of detonation has been determined to be about 20,000 feet per second. That is, if one should take a big iron sewer pipe about 4 miles long, and fill it with No. 1 dynamite, and detonate it at one end with a powerful exploder, it would take about one second for the explosive wave to travel the entire length of the column of high explosive, the explosive wave traveling at the rate of about 4 miles per second. This illustrates how in the Daly-West disaster horses were killed, 2 miles from the scene of the disaster, the explosive wave requiring about one-half second to traverse that distance.

Personal; Commercial Paragraphs; Recently Declared Mining Dividends; New Patents; Notices of Recent Patents; Obituary, 55.

THE passing of John W. Mackay is the occasion of universal eulogy, all of which is deserved. Seldom indeed has the death of any man elicited so general a tribute of praise as that bestowed on the memory of the miner who made millions without a shadow of dishonesty and who made the world better for having lived in it. Most men when they acquire, say a million, become spoiled; some swell up and forget their old associates; others become howelless beings with hut a hook and a claw. Mackay was the same when timbering on the Comstock for \$4 a day or after amassing \$30,000,000. The millions meant to him only opportunity, a chance to give rein to the generous impulses of his nature, and to step into wider ways of business. He was a good example of an American workingman, a living illustration of the opportunities for wealth that this country affords; his charities were not bounded by country nor creed, and he always to the last believed in good honest work. Ordinarily some perfunctory words of praise are said by those immediately concerned when a rich man dies, but with Mackay it is the man and not the money that thousands recall, and genuine respect is manifested for his life and character.

TAXATION of mining interests is always a complex problem. In general, it is well nigh impossible for an assessor to put a just value on several hundred mining claims. It is much easier to assess town lots, orchards, farms, buildings or live stock, but difficult to equitably value mining property developed or undeveloped. A property may not appear to be worth \$1000 to-day, and in ninety days may be actually worth \$1,000,000; or it may be apparently worth \$100,000 now and not be worth \$100 in six months. A mining property is a constant source of expense and nothing but expense till it becomes a producer. Then it usually becomes a profit to its owner, and to the community where it is. It furnishes employment and adds to general and permanent wealth. It is a creator of prosperity, hence the hand of the tax gatherer should ever be laid lightly upon it. No mining property should be taxed until the productive stage is reached, and then only on the net output. The miner is inevitably taxed in a variety of ways, and deserves a certain degree of fostering care from the State and Federal Government. To tax the mines to death means to destroy or greatly retard that region's mineral development and the frightening away of capital. Of course, a fair share of taxation should be placed on all mining property; but,

when carried further, it injures the mining industry and every other class of business dependent upon the miners.

FROM various parts of western Nevada in the last year have come reports of rich finds of gold ore and subsequent development has shown that in nearly every case the original report was not exaggerated. Nevada is second to none of her sister States in mineral wealth, but since the decline of the Comstock has not for twenty years been given the attention that it is now receiving. Ten years ago this paper pointed out that new Comstocks were awaiting development in that part of the State, saying that when men realized that the old glories of the Comstock could never be fully resuscitated, new bonanzas awaited development with far less expenditure and under newer and more favorable auspices. It would have sounded singular to say it then, but it is within the bounds of probability to assert that in five years the annual gold yield of Nevada may equal in amount that of any other State. Nevada was long known as "the silver State," but even in the days of her greatest hulsion yield, between 1870 and 1880, the average of the Comstock output was 46½% gold.

TO THOSE of our readers who do not keep a card index or who do not even keep a file of the paper the suggestion is made that even now, or at any time, it were well to begin. It is the commonest occurrence in this office to get a note: "Last year (or it may have been the year before) I saw an article in your paper on so and so. I have immediate use for the data and would take it as a favor if you would send me the copy." With anxiety to oblige and with every desire to accommodate any subscriber it is often impossible to supply what is wanted from such meager data, and an hour's research is oftentimes lost in fruitless endeavor to supply what is wanted. A copious index is bound in the twenty-sixth issue of each volume, and, ordinarily, the index affords the reader a clue to just what he may want to find. Better still is the card index. Some one has happily said that good habits are just as easy to form as bad habits, and just as hard to break. It is earnestly suggested that the "habit" of making a card index be formed. It will be found useful, and like other useful things will save all concerned considerable valuable time.

THE long-distance pipe line, now building through central California for the transmission of oil to the numerous industrial concerns clustered around San Francisco bay and projected water transportation, will further break the price of coal which at a high figure so long held down the mining, manufacturing and general industrial interests of California. The same conditions now obtain in Los Angeles and other points, and there is a general lowering of fuel bills throughout California. Fuel oil is now on the market at from 60 to 80 cents per barrel for the best qualities. Steam coal used to cost from \$8 to \$12 per ton; oil at 70 cents per barrel is about equal to steam coal at \$3 a ton, illustrating how oil for fuel excels in point of economy. Coal receipts at the port of San Francisco are constantly decreasing, but 621,888 tons having arrived during the six months ending June 30, 1902, there being a decrease of nearly 500,000 tons of coal so entering during the last two years and a corresponding increase in fuel oil consumption. Deep sea-going vessels, as well as railway locomotives, are successfully using oil, and arrangements are being made for oil shipments to the Orient. The stimulus to Pacific coast industries is becoming monthly more noticeable. Mining plants throughout California are beginning to use fuel oil, which, with electricity, will relieve mine operators from former heavy expense and expedite mine development accordingly.

OLD readers of this paper who were once young will remember an effort, finally successful, that secured \$600,000 State and Federal appropriation for impounding mine debris in the lower Sacramento valley, Cal. A great deal of space was devoted by this paper to the matter and considerable zealous effort was made to get the money. The money was secured, and has been available; untoward circumstances have kept things just as they were. This week the matter comes up again. The idea is now entertained that actual work may begin this year on the first of a series of proposed dams, on the Yuha

river, 16 miles east of Marysville, Cal. The plan is to store mining debris and control the low water channel of that stream. The whole scheme long since received official sanction. The matter was made the subject of special effort at the 1901 session of the Cal. State Miners' Association. Bids for the work will be opened at Washington, D. C., on the 12th prox., if the preliminary specifications be approved by the Secretary of War, though it is yet an open question as to whether the work will be done by contract or direct by the Cal. Debris Commission.

IN last week's issue the helief was briefly stated that the water problem in the Leadville, Colo., district could only be solved by pumping, the contour of the country precluding the probability of deep drainage being successful. In the case of the Cripple Creek, Colo., district conditions favor the solution of the water question by deep drainage, but such a drain tunnel must necessarily be a joint affair—a common enterprise prosecuted at the expense of the several properties to be benefited. Experience on the Comstock and elsewhere shows, however, that to secure such joint co-operation is very difficult. The obstacles appear insuperable. The Elkton is at present the one property most directly affected. In that mine the cost of pumping now cuts so deep into the profits as to make questionable from their lone point of view the policy of continuance. The management is about to put a new and more powerful pump on the ninth level in the effort to fight the water out, and deserves applause for the strenuous and long-continued work therein. The case in Cripple Creek is the same in kind but greater in degree with the situation in Clear Creek and Gilpin counties. The Newhouse tunnel at Idaho Springs, now 2½ miles long, if extended an equal distance would tend to solve the same water problem in Gilpin county that affects Lake and Teller counties. But the kingdom of Gilpin is not yet inclined to co-operate with Manager Newhouse to the extent of sharing in the heavy expense that such extension would entail. Of course, this whole drainage problem is a case of history repeating itself, for sooner or later those interested will realize the need of making common cause. Probably the ultimate outcome may be legislation similar to that in the case of the Sutro tunnel in Nevada, with the same result.

ROSSLAND, B. C., MINING MEN are inclined to think that the process of concentrating mineral values from the ores by the use of oil may mean as much for that district as the cyanide process does for South Africa, the Le Roi mine manager citing the fact that that mine's large low-grade ore bodies, with too much silica and too little copper for profitable smelting, can with assured success use the Elmore process of concentration—or, rather, separation. In the case of the Le Roi ores ordinary concentration methods are precluded, because of the brittle chalcocopyrite in the ore. The manager's figures show that the total cost of mining and getting the ore on cars is \$2.62 per ton. Of all mined, one-fifth was sorted out, the remainder having to pay all charges, including the sorting, the sorted material being of no value under present treatment. Mr. McKenzie figures that by using the oil process all the ore mined can be treated, bringing the cost of mining down to \$2 per ton, the cost of crushing and concentrating 50 cents per ton, the oil loss 15 cents per ton of ore treated. The tests, so far on a small scale, show a saving of 80%. Mr. McDonald, manager Le Roi No. 2, says on this subject: "Tests of the ores of this camp show that the Elmore process can concentrate what is now considered waste rock—that is, ore running one-half of 1% copper—twelve tons into one, making a product containing 6% copper, and eliminating at the same time a large percentage of the silica and aluminum, that now constitute the chief expense and difficulty in smelting these ores. The resulting product—that is, the concentrates—will require less than one-half of the fluxes and not more than one-half of the coke now required to smelt a ton of the crude ore. All the costs of concentration by this process should not exceed \$1 per ton, including freight to the works." Meanwhile Manager Severin Sorenson is to be the Rossland pioneer in any kind of concentration, he being about to put in a small concentrating plant at the Velvet mine, the whole thing being purely experimental in that region.

Concentrates.

QUICKSILVER is quoted at \$50.00 per flask in Denver, Colo.

A 1½ H. P. MOTOR would run ten or twelve 16-candle power incandescent lamps.

SO FAR as "Concentrates" knows, the altitude has no appreciable effect on the result of an assay.

BLUE PRINTING by electric light is feasible, and often found in actual practice to be as satisfactory as by sunlight.

INCREASING railroad speed from 30 to 60 miles per hour doubles fuel consumption and increases water consumption 50%.

ACETYLENE GAS can be used in a gas motor, but there is no object in such use; it costs more and requires more care and precaution.

MOST certainly two years' assessment work can be done at one time—beginning the assessment for the current year in December, working right along and in the following January doing the assessment work for that year.

A DYNAMO for igniting a charge in a gas engine is usually a small machine built for this special work. It is not adapted for lighting purposes. Current from a lighting plant could be used to ignite the gas for a gas engine.

THE theoretical is but a study of the practical; the practical man is often of little use at theory except in so far as he builds under competent supervision the parts which the carefully evolved theories of his more studious confreres have made possible.

SOUTH AMERICAN ores are mostly treated in Europe, though a small portion goes to Pueblo, Colorado, via San Diego, Cal., and a still smaller portion comes to San Francisco. There is an increasing amount of ore treatment at Autofogasta, Chili, and other points on the west coast.

WHERE a sheet of water is falling vertically down the face of a dam, practically no vacuum could exist between the sheet and the dam, as there would be nothing to resist the external pressure on the water sheet, and at the very instant that the water began to form external air pressure would force the sheet of water back against the dam.

IN the case of *Ober vs. Schenck*, 65 Pac. Rep., 1073, the Supreme Court of Utah decided that, where a mining lease provided that it should terminate on "a sale or transfer" of the property, the word "transfer," as there used, related to a transfer of the title to the property, and not to a mere transfer of the right of possession of same.

ONE 42-gallon barrel of oil, specific gravity .920, will weigh 325 pounds. Three such barrels of oil will produce as much steam as one ton of anthracite coal. One pound of oil, gravity .920, free from water, sand and clay, will evaporate as much water in a steam boiler as two pounds of anthracite coal, two and a quarter pounds of ordinary bituminous coal, or three and a half pounds of lignite coal.

MAGNET WIRE is ordinary copper wire covered with one or two layers of cotton thread so that the wire of one turn or layer shall not touch the wire of the adjacent turns or layers. Magnet wire is just insulated wire; common wire is uninsulated. Insulated wire is used so that the electricity must go through the whole length of the coil round and round, and not pass across to the other end of the coil directly.

IN setting telegraph and telephone poles the earth should be removed a few inches from the poles and at a depth of 2 or 3 inches, and this hole should then be filled with tar oil, so that the pole is tarred just above and below the ground. After this is done the earth should be placed back. In some localities companies using large, round poles dig narrow channels from 2 to 3 feet deep around the poles and fill the channels with rock salt for surface preservation.

A BOILER explodes because it is not strong enough to stand the pressure that is put upon it, and that covers the whole ground. The boiler may be new, with defects that render it at once unsafe, and when working pressure is put upon it there is trouble, or it may be old and gradually grow weaker until it fails under an ordinary pressure. Of course, it takes an experienced engineer to tell when it has become unsafe, but there is nothing supernatural about it.

TO USE one of those divining rods or magnetic indicators in the search for gold or silver, it is easier and just as effective to get a good map of the region, and pass the divining rod or indicator over its surface. Thus instead of wearily traversing what may be a rough country the devout believer can save considerable exertion by the use of a map in the manner indicated. It is much easier, and the result, so far as tangible results are concerned, is the same in either case.

TO TEMPER and harden a tap, bring the completed tap to a blood red, even heat. Dissolve a handful of salt in a bucket of clean water, set the water to whirling by stirring in it a stick and thrust the heated tap vertically into the vortex of the whirlpool. The tap is to be drawn to a straw color. Heat a piece of cast-iron tube to a dull red heat. The tap is then to be held in the center of the tube and carefully turned until the proper

color is produced. Quenching will fix the color and finish the tap.

THE Parke-Whittaker cyanide process is designed mainly for the extraction of gold and silver from cupriferous ores or concentrates. After the ore has been given a chloridizing roasting the soluble copper chlorides are leached out by water, and after the subsequent application of an alkaline wash a dilute solution of cyanide is used to extract the gold and silver.

WHERE two mining locations adjoin, and have one common side line, and where the croppings of a vein, apexing upon the senior of these two locations, and dipping towards the junior, crosses this side line to the surface of the junior location, the vein does not become the property of the latter until the whole of it (both foot as well as hanging wall) passes into the territory of the junior. Nor does the latter acquire any underground or extralateral rights under said croppings until all of them and both the enclosing walls are in their territory.

IN modern chain making the chain cables are rolled direct from steel bars. The bars are heated in a furnace 70 feet long, and are drawn direct into the rolls. In the course of its passage a bar of this length, weighing two tons, is quickly converted into a red-hot 1½-inch cable, 90 feet long, link within link, without weld. The links are connected by webs and fins, which are afterwards removed cold by punching and special planing machines. It is stated that a cable made in this manner from the usual ship quality of steel is 50% stronger than the best welded iron cable of the same size, and that it is very tough.

A PLACER LOCATION covering 160 acres is considered as one claim by the Land Department since July 1, 1898, and \$4000 worth of work is necessary; but all may be patented under one application, if adjoining each other. It were well to note in revised U. S. statutes as to all that is necessary under rule 53. The eight locations are assumed to be united in each 160-acre lot. If they are in thirty-two 20-acre locations \$500 worth of work will have to be done upon each claim to entitle the applicant for patent. It would require a separate application for each lot or location if the same are separate or cannot be joined either before or after that date.

IT IS POOR PRACTICE to use a file in attempt to dress the commutator of a dynamo or motor. Sandpaper is much better, and even with the latter a little oil on the sandpaper is in order as a preventive of particles of copper flying into the armature, increasing the danger of short circuits or burning out. Copper dust and metal filings in general should not be allowed to collect about a dynamo or motor. Emery cloth should never be used on a commutator, for the particles of emery are so sharp they become lodged in the copper of the segments, making a grinding tool of the commutator. Then, too, the particles get into the mica and occasion short circuits. A motor with short-circuited coils or bad grounds will draw excessive current, even though running free of load.

INFUSORIAL EARTH, sometimes known as fossil meal, diatomaceous earth, and by other names, has of late years found numerous applications in the arts. Its principal use is in the manufacture of dynamite, by virtue of its property of absorbing and holding in suspension several times its weight of oily substances, such as nitro-glycerine. It is used also as an ingredient of soaps, the cleaning powers of which it assists principally by its mechanical action. It also affords a source of silica in the manufacture of the so-called soluble glass, or silicates of the alkalis. It is used in the manufacture of extremely light bricks and other compositions for fire-proof linings of magazines and the like, and in similar compositions as a filtering medium for water, and for other uses less important.

TO MAKE anything like a good job of soldering, the pieces to be soldered must have all grease and dirt removed so as to expose the clean, bright metallic surface. This is best and easiest done by the application of some acid. Muriatic acid is as cheap and as easily applied as any. It is prepared as follows: Into an earthen jar or cup put about one ounce of muriatic acid, into which drop small pieces of zinc until it ceases to boil. When the acid has cooled pour it into a four-ounce bottle and add sufficient water to fill the bottle about three-fourths full. The acid is applied with a swab, after which a thin coating of solder is rubbed over the surfaces with a soldering iron. When dissolving the zinc in the acid care should be taken to avoid inhaling the fumes which arise during the resultant "boiling."

NOTICES OF LOCATION are always to be liberally construed. A notice of location of a mining claim which describe it as bounded on the east by H. Mine, and as being a quarter of a mile south of the B. road and about 2 miles east of C., sufficiently describes the claim with reference to natural monuments. The law will not hold the locator of a mining claim to a strict and technical observance of the statute in respect to the terms of his notice, so long as he substantially complies with its requirements; and if it appears that the location was made in good faith, and if by any reasonable construction, in view of the surrounding circumstances, the language employed in the description will impart notice to subsequent locators, it is sufficient. A final notice of the location of a mining claim which fails to mention either the State or county of the purported location, but which refers to the preliminary notice posted by the locators as required by law, and recorded in the proper county, which latter notice named the county in which the claim is located, is a

sufficient compliance with Rev. St. U. S., Section 2324, requiring all records to contain such a description of the claim located, by reference to some natural object or permanent monument, as will identify the claim.

If a hole were bored through the earth, and if all friction and resistance to the passage of a ball dropped into this hole were eliminated, the only force acting being that of gravity, the ball would fall with an increasing velocity till it reached the center of the earth. At that point it would have its greatest velocity and momentum. It could not stop there. It would pass beyond the center of the earth as far as it had fallen to reach it—that is, it would go through the earth to the other side and then fall back to its place of starting. This it would continue to do forever under the conditions imposed. The motion would be no different from that of the pendulum of a clock, which oscillates under gravity alone as readily as any other falling body. A pendulum is a falling body, exactly like the supposed ball dropped into the earth. It falls to its lowest position and rises as far beyond it as it has fallen, just like the ball dropped into the earth. The mechanism of the clock is simply designed to restore to the pendulum the energy which it loses in each swing because of the friction of the air and other frictions in its motion. These the freely falling ball, by the conditions of the question, would be freed from. Hence it would move forever without loss of energy. If this be disputed or denied the disputant or denier can bore the proposed hole and try it for himself.

THE old method of making potassium cyanide was to take dehydrated ferro-cyanide of potassium and heat it with potassium carbonate— $2K_2Fe(CN)_6 + 2K_2CO_3 = 10KCN + 2KCNO + Fe + CO_2$. The resulting cyanide contained cyanate, but this did not materially interfere with its use. An almost pure cyanide can be obtained by heating the ferro-cyanide alone until it decomposes into potassium cyanide, nitrogen, and a compound of iron and carbon— $K_4Fe(CN)_6 = 4KCN + N_2 + FeC_2$. This method entails the loss of one-third of the nitrogen contained in the ferro-cyanide, and to avoid this waste of nitrogen it is now not uncommon to add the proper amount of an alkali metal to the melted ferro-cyanide— $K_4Fe(CN)_6 + 2Na + 4KCN + 2NaCN + Fe$. It is in this way that the most of the so-called chemically pure potassium cyanide now sold is made. The product is not a pure potassium cyanide, but a mixture of potassium and sodium cyanides. It also contains a considerable quantity of potassium carbonate, which is added to it during the course of manufacture to reduce its strength, for the combined cyanides, made according to the above formula, have a higher percentage of cyanogen than chemically pure potassium cyanide could possibly have. An inert material like potassium carbonate is therefore added in sufficient quantities to reduce the cyanogen contents to 39-40%, which is equivalent to 98-100% cyanide of potassium.

The legal measurement of water in California is the miner's inch, which is the quantity of water that will flow through an opening of 1 square inch, under a pressure of 4 inches above the top of the opening. A miner's inch is equivalent to a flow of 1.394, theoretically 1.57 cubic feet, or 8.976 gallons per minute. The velocity of running water is measured by the same laws as that of heavy falling bodies. A falling body increases its velocity in proportion to the time it is falling; and the distance fallen is in proportion to the square of the number of seconds of time it is falling. The theoretical velocity of water flowing out of an aperture of 1 foot is 8.02 feet per second; experimentally it is but 5.4 feet. The velocity of a stream of water flowing from a ditch, or other source, is equal to that which a heavy falling body would acquire in falling from a height equal to the distance between the surface of the water and the middle of the orifice. This distance is called the head of water. The quantity of water issuing from an aperture is in proportion to the square root of the head, and the velocity is in proportion to the square root of the head. With an aperture 1 inch in height the head of water under a 4-inch pressure would be 4½ inches. The square root of a 4½-inch head is 2.12 inches and of a 6½-inch head 2.55 inches. Therefore, an opening that will allow the escape of 100 inches of water under a 4-inch pressure will in the same length of time under a 6-inch pressure discharge 120 inches. The work which water can do is in proportion to the quantity multiplied by the square of the velocity; that is, the work is in proportion to the square root of the cube of the head. By means of the following rough-and-ready rule the quantity of water flowing in a ditch or stream may be approximately determined: Select some point where the flow of water is about the same for a distance of, say, 50 feet. Then make a number of different measurements to find the average width. In like manner make a number of measurements in the middle and along the slope of the banks of the stream or ditch, to ascertain the depth of the water; add these measurements together and divide by the total number of measurements made to ascertain the average depth. Then, to find the velocity, place a piece of heavy wood in the stream and as accurately as possible rate the time required for it to pass over the distance above mentioned. Multiply the area by the main velocity and the product is the volume in cubic feet; divide the number of cubic feet by 1.57 and the result will be the number of miner's inches. Take, for example, a stream of the average width of 100 inches and average depth 10 inches, with an average velocity of 5 feet per second: $100 \times 10 \times 5 = 5000$ cubic feet; $5000 \div 1.57 = 3184.71$ miner's inches.

The Credit of Mining Engineering.

Written for the MINING AND SCIENTIFIC PRESS by C. H. FITCH.

There is in the State of Kansas a man who has recently made a most notable advance in higher mathematics, in the practical solution of equations. This work is recognized the world over by university professors in this special branch of science, but I venture to say that the average reader even of engineering journals would be puzzled to name the man, or to explain what he had done to be credited to the American account in the advancement of science for the benefit of the whole world. It may be too much to expect that so abstruse a subject as the higher mathematics can be made to take hold of the popular imagination. It is said that one of the most honored correspondents of (in its sphere) a great mathematical society died recently, recognized by his technical fellows as a man of rare genius, but known to his local neighbors only as a market gardener who sold them ordinary vegetables.

After college graduation I, like many others, have spent some years of laborious study largely devoted to work in advanced mathematical courses. In the stress of commercial work less favorable to concentration of mind on abstruse studies than market gardening I have "backslidden." I am no more than within shouting distance of such achievements as I have mentioned. I can follow and define what has been done with difficulty, but I have lost all reserve force and power of origination in such work.

Imagine the great mathematician, his ponderous brain teeming with calculations and conceptions such as ordinary mortals "wot not of," jogging along on his vegetable wagon. Past him rushes the tallyho, cutting a wide swath of notoriety with its red paint and varnish and loud hughle calls, bearing members of the "smart set" whose pictures are already in press to announce to a news-hungry public that such and such persons have achieved the unique distinction of going to see a show. No doubt each party to this comparison has his own sphere and his own reward. I note the contrasts. I do not quarrel with them. To popularize mathematics may be neither possible nor desirable.

But there are less extreme tasks which lend themselves better to popular interest. It is possible, and legitimate and desirable, to popularize mining in the public estimation. In this subject mining, miners and mining engineers constitute one united interest. What position is taken by this fraternity as a factor in the national life? A useful and important one, no doubt, but it might be made still more useful and more important. It might command a larger measure of public interest. It might have a secretary in the President's cabinet. When its national conventions are held at Milwaukee, or Boise, or Butte, they might not be considered as side shows and unessential affairs, to be dismissed with a paragraph like the synd of some small sect.

To enhance popular interest in mining helps everybody and everything connected with mining. And mining, in turn, will help the people more than they realize. We may toil at other industries in competition as hard as we please, and have only our labor for our pay, but in the mining product we strike the keynote of values and obtain from it not only intrinsic worth, but the power of distribution which justifies wealth and puts it where it will do the most good, namely, in the hands of live people.

The issue of all politics and statesmanship the world over is rapidly gathering into one portentous question: Shall the wealth which is being produced in ever increasing abundance be used to promote life or to stifle it? Shall our civilization go forward or shall it recede?

In the answer to this question, in the decision upon it, mining has the conclusive vote. Conservatism and restriction in the general commercial world tend ever to hoard and tie up wealth, to take it away by process of law from the mouths that need to be fed, the bodies that need to be clothed, and the minds and souls that need to be educated, nourished and equipped with vital interest. These are the essential things, and avarice with its cash account, fearful of loss of a penny of profit, undoubtedly does tend to crowd them to the wall. Then social discontent arises and there is a movement to break the law that binds too hardly upon life as a woman might break her corset steels. Some execrate plutocracy, others execrate anarchy, and when they get at each other's throats in earnest the strife will be very nasty and very deadly.

But mining of the precious metals in ever increasing abundance comes as a mediator to prevent this strife. It reduces the value of the hoard, takes the edge off from avarice, removes the restrictions put upon life. Every ounce of gold redeemed from the grasp of the hanks of nature in the mountains of the West loosens an ounce of gold in the grasp of the banks of man in the cities of the East. In the prosperity of gold mining the field of opportunity in life is widened for every laborer. It affects favorably even every negro picking cotton in the South, and every mill hand in the woolen mills of the North. It is as necessary to the farmer as his wheat, and to the machinist as his tools.

The people do not realize these things. They do not know what a good brother they have in mining.

If they did they would insist on a mining secretary in the cabinet, and they would insist that no artificial restriction should be placed on the right preservative of all commercial rights, the right to get value, determining value out of the ground.

The miner has something more than the natural and laudable desire that his work and profession should have a large and honorable place among other professions. He has a public duty and service in making it strong and influential and popular.

The technology of the subject is all right, treatises are all right in their way, but they do not affect the strong popular interest and sympathy which should pervade every class with respect for mining. We look to the mining papers to arouse this kind of interest, and, while a large work remains to be done, it is a simple matter of fact that the MINING AND SCIENTIFIC PRESS comes nearer to filling the measure of its opportunities in this line than any other publication. I say this not because I am writing for the MINING AND SCIENTIFIC PRESS, but I am writing for the MINING AND SCIENTIFIC PRESS because I feel this fact, and incline toward the paper as one flame inclines toward another.

I do not underrate the value of the technical articles, not only the articles which come from the proceedings of engineering societies and make good copy and give good information to readers of several journals, but the exceptional rich fund of original contributions which are peculiar to the columns of this paper, and which come from practical and technical men in position to observe and report facts of great value. Yet I think that the fact that the MINING AND SCIENTIFIC PRESS draws to itself so many of these is due largely to the other fact that mining men like the MINING AND SCIENTIFIC PRESS and turn to it naturally with a home-like sense, a sense that they find in it good company and an honest, genial and fitting representation.

The MINING AND SCIENTIFIC PRESS is always interesting. Its news is seasoned with humor. It is not too stilted to admit an anecdote or a campfire story. It relaxes in amiable spirit, but never, I believe, in its disposition to hew close to the line of truth in representing the facts about mining properties. It brings us into close and vital touch with mining and the miner's life. It is the most popular of mining papers.

For this reason it is the best influence we have in the large and growing work to be done in popularizing mining. I feel that this work requires to be pushed, that it may be made to avert the most serious political dangers, and that if there were no politics it would still be an entertaining and beneficial work. The problem is to make the tale of mining so interesting that it shall draw, even like those other tales which were strong enough "to draw children from their play and old men from the chimney corner."

I am persuaded that the subject in itself has all this power of magnetic interest. There remains the ability to call it into action, for the good credit of mining engineering.

Electro-Metallurgical Industries of Germany.

There are seven copper works and the total copper production of Germany has increased from 24,700 to 32,000 tons in the last ten years. The Hoepfner copper process is there in diminished use. Only a small quantity of copper is produced there at present, and the production of copper at that plant may be given up, "because copper-nickel matte is not available." The Elmoro process, in use at Schlarden for making copper tubes, has reached approximate perfection. At a Hamburg refinery about 3000 kilograms of fine gold are produced yearly by the Wohlwill process, the anodes being of raw gold, 980 fine, with impurities of platinum and silver. From the sludge about twelve to fifteen kilograms of platinum are obtained. Quantities of Transvaal gold, down to 850 fine, are electrolytically refined. The electrolytic zinc industry is languishing. The deposition of pure solid zinc is impossible, if the solution contains many impurities. Zinc is more electropositive than hydrogen and can be obtained from neutral or slightly acid solutions only for the reason that a higher E. M. F. is required to make a hydrogen ion give off its charge at a zinc electrode than at an electrode of most other metals. If the solution contains impurities of metals which are more electronegative, these are preferably deposited, with the result that the cathode is then no longer pure zinc, but is mixed with other metals, by which a hydrogen ion gives off its charge more easily than a zinc ion. The most dangerous impurity is iron. In reference to the troubles in the analytical examination of zinc by electrolysis, if iron is in the solution, as long as there are much more zinc ions than iron ions zinc is deposited; but when the ratio of the number of iron ions to that of zinc ions reaches a certain value, iron is deposited, together with the zinc. The cathode then contains iron, and at this iron hydrogen ions can give off their charges more easily than zinc ions. Zinc is dissolved with vivid development of hydrogen and disappears from the platinum pan. This is brought into connection with the influence of current density upon the form of the zinc deposit. When a pure zinc salt solution is electrolyzed with a pure zinc cathode, zinc is deposited and hydrogen appears only at high current densities.

Mining Asbestos in Canada.

W. MOLLMAN.

The principal localities in the province of Quebec where asbestos is mined are Black Lake and Thetford. The asbestos is there found in narrow fissures 1 to 1½ inch in width of the belt of serpentine. The fibers are generally perpendicular to the walls of the stream. Although the veins seem to run in all directions, yet on closer examination a certain order is discernible. Foremost among the latter is the grouping of the fissures in long-drain zones, which again may include narrower and richer ones. It does not always follow that by penetrating deeper the veins enlarge. In fact, the reverse is often the case.

As long as the genesis of asbestos is not thoroughly understood, we shall not be able to set up definite rules and methods, as obtain in the mining of ore and coal, to assist in the opening and development of asbestos mines. I surmise that the formation of asbestos from the serpentine magma was materially influenced by granitic eruptions. The frequent occurrence of fissures running in all directions in the serpentine gives evidence that the area must have been subjected to intense disturbances after the cooling or solidification of the serpentine. The effect of these disturbances causes the greatest difficulties in the development of an asbestos area.

The mining of asbestos is carried on by quarrying. As the fissures or seams are small, it naturally follows that a great deal of dead matter has to be moved. The serpentine carries on the average from 3% to 4% of asbestos, and rarely does it reach as high as 6%. Dynamite is used as the explosive, and is put into 10 to 12 feet deep drill holes. In out-of-the-way places the hand drill is still used, otherwise steam or compressed air is utilized. The broken rock is reduced to smaller pieces by means of heavy sledges and steel wedges, and then smaller hammers are used for separating the asbestos from the gangue. The latter work is done either in the quarry or under cover when a purer asbestos is desired. For this work boys from fourteen to sixteen years of age are employed. As magnetic iron ore is sometimes found in the asbestos, particular attention must be paid that the fibers are not unnecessarily damaged in separating the mineral. This treatment furnishes what is known as "crude" asbestos, which is then ready for shipment in bags of 100 pounds. There are two grades, crude No. 1 and crude No. 2.

On account of the relatively small percentage of asbestos in the rock blasted, it is necessary to have special appliances for moving the latter. For the smaller mines the ordinary crane answers, but for larger ones the crane is supplemented by cables. In the latter case the cable is put at an angle of not less than 30°, so as to utilize gravity in returning the pit boxes to work. It is evident that by either of the above two methods the area that can be served is very limited, and this has led to the introduction of cable derricks with tail rope. In applying the latter means a cable 1½ inch in diameter is stretched across two masts from 30 to 60 feet high. One end of the cable is fastened to some high point in the quarry, while the other end is fastened on the other side of the mast, and distant as far as possible from the foot of the mast. By means of the endless cable the engineer is enabled to lower the pit box quickly, and to hold it at any desired point. The hoisting cable (¾ inch) brings up the load. The pit boxes are shallow wooden boxes lined with sheet iron, and carry from one to one and a half tons. After being hoisted to the surface they are either loaded directly onto wagon frames or are dumped into larger dumping cars, and then moved by horse or steam power. For hoisting, twin steam engines of from 15 to 20 H. P. are used.

A few words may be added about the treatment of the less valuable asbestos. This latter consists of waste (mostly serpentine) from the crude asbestos, and of larger pieces of serpentine traversed by small veins of asbestos, which, however, it would not pay to treat by hand.

The extraction of the fiber from this inferior material is done by machinery in asbestos mills. The broken material, or at least the smaller pieces, is first subjected to a drying process in rotating cylinders; it then passes through some stone crushers and rollers, whereby it is reduced to a given fineness, when it passes into the cyclones, where further reduction takes place, especially the disintegration or separation of the individual fibers. This process (centrifugal) continues until the rock is ground to sand and the asbestos fibers are thrown onto the separating sieves. From the latter the fibers are drawn away by exhausts, and the sand is blown into bins. Nothing remains now to be done but to fill this asbestos, known as "paper stock," into bags of 100 to 150 pounds for shipment. According to quality it is designated as No. 1, 2 or 3. Crude asbestos, No. 1, sells from \$150 to \$250 and No. 2 from \$80 to \$150 per ton. Paper stock runs from \$20 to \$40 per ton. To explain the difference between the above prices it is necessary to state that in the different mines for a given class different prices obtain, depending upon the length of the fiber and upon the per cent of impurities.

At the present time there are in Canada twelve

asbestos mining companies, with a capital of \$4,000,000, the mines employing at present about 3000 men. Difficulty is experienced, especially during the summer months, in obtaining sufficient labor, and efforts are made to obtain the requisite supply. The wages for a ten-hour shift are from \$1.25 to \$1.50.

Recent Rock Drilling Contest.

In last week's issue was given the results of the recent rock-drilling contest at Idaho Springs, Colo., on the 4th, 5th and 6th inst. During this week have

Leyner and Sullivan Machines Drilling Uppers.

Owen Williams Operating Ingersoll Drill.

been received sundry photographs and details. In all \$400 was given in prizes. The Idaho Springs Gazette contains an excellent account of the contest, which was of considerable interest. Each crew of two men to a drill, set up and drill two holes, tear down and replace as found; of the two holes to be drilled one was to be above the horizontal and one below, the angle in each case not to exceed 25°; each hole was to be 9 feet deep, the gauge of the finishing drill to be 1 1/8 inch; the size of the drilling machine to be not over 3 inches air cylinder; air pressure to be maintained at 110 pounds, judges' decision to be final. It was a fight to a finish on the part of eleven of the contestants; three makes of machine drills were used. The accompanying tabulated record, as taken from the Gazette, gives the whole thing in detail:

quicksilver produced in California, 20,950 flasks were received at San Francisco, the remainder being shipped East. There was very little variation at San Francisco during 1901 in the price of quicksilver, which ranged from \$46 to \$48 per flask for domestic and from \$44 to \$45 per flask for export. The exports from San Francisco during the year amounted to 5337 flasks, valued at \$242,908, practically the entire quantity being shipped to Mexico and Central America. Notwithstanding the increased production of 1410 flasks, the stock in sight unsold on Jan. 1, 1902, including that at New York, was but 2230 flasks. In California two new mines have been added to the list of producers—the Karl mine and the Libertad

mine, both in San Luis Obispo county. The largest producers were the New Idria, in San Benito county; the Napa Consolidated, in Napa county, and the New Almaden, in Santa Clara county, the production of these being about equal. California has produced nearly all of the quicksilver obtained in the United States, and in the fifty-two years since 1850, inclusive, the grand total of California's production has amounted to 1,884,059 flasks of 76 1/2 pounds net—an average of 36,231 flasks per year. Of this great amount, one mine, the New Almaden, in Santa Clara county, has produced a little over 50%.

The mining and smelting of quicksilver ore in Texas

(1) Second hole 4 1/8 inches short; disqualified.
(2) First hole "fitchered;" contest abandoned; no record.
(3) Second hole ran into old hole; contest abandoned; no record; changed machine; no time allowance.
(4) Back head broke; 17 minutes 45 seconds allowed for changing machine.
(5) First hole 3 inches short; disqualified.
(6) Time of first hole includes 6 1/2 minutes change of machine; no allowance.
(7) Ran into old hole; contest abandoned; no record.
(8) Broke steel in second hole; contest abandoned; no record.
(9) The 40 1/2 minutes include 15 minutes drilling, 5 feet 1 1/2 inch on second hole, which ran into an old hole and was abandoned and a third hole drilled.
(10) First hole, 9 feet 3 inches; second hole, 9 feet 3 1/2 inches.
(11) Contest abandoned; first hole "fitchered."
(12) First hole, 9 feet 3 1/2 inches; second hole, 9 feet 3 1/4 inches.
(13) Abandoned contest before completing second hole; no record.
(14) "Fitchered" in second hole; contest abandoned.
(15) Ran into old hole and abandoned contest before finishing first hole.
(16) Six and one-half minutes allowed for changing valves on machine; "fitchered" in first hole at 37 1/2 minutes total time; abandoned contest.

Extraction of Gold by Chlorobromuration.

C. GROLLET'S PROCESS—(CONDENSED)

NUMBER II.

The screens most generally used in the stamping of gold ores are No. 30. Between the largest grains and the impalpable slimes there is a difference so great that it is necessary to effect a classification by equivalence and to treat each size in separate apparatus. Wet stamping produces 30% of fine dust that resists filtration. In the Transvaal it is treated in two different ways: (1) In special tanks provided with automatic distributors, and (2) in causing the pulp to pass into Spitzluten with ascending current, and then into Spitzkasten. At the Crown Reef, where the MacArthur-Forrest process is used, the pulp classified in Spitzluten and Spitzkasten gives large sands, medium sands, fine sands and slimes. The first (concentrates) represents 5% to 6% of the weight of the ore, and contain 33% of pyrites and 32.77 grams of gold to the ton. They are treated by cyaniding. The treatment lasts sixteen to eighteen days; the residues contain 2.95 grams of gold to the ton, representing a theoretical yield of 90% to 92%. By theoretical yield is understood the difference between the contents of the ore and the contents of the tailings. The medium sands, slightly pyritic, are in the proportion of 7% or 8%. They contain 15.43 to 18 grams of gold to the ton. They are treated by cyaniding, the operation lasting seven to eight days. The residues contain 2.34 grams of gold to the ton, the theoretical yield being about 80%. All the rest of the pulp, fine sands and slimes go into the tanks provided with automatic distributors.

At the Worcester mill, where the Siemens' method is used, the pulp classified in Spitzluten gives four categories of products. The results of the operations are recorded in Table II. The medium sands and fine sands are treated together, the slimes are not treated. The average theoretical yield is 74.6%.

TABLE II.

Gold Contents of Tailings (Grams) per Ton.....	Duration of Treatment in Days.....	Gold Contents of Tailings (Grams) per Ton.....	Theoretical Yield percent.
15% of large pyritic sands...25.71	9	2.57 to 3.43	85.66 to 90.0
50% of medium sands.....10.30	5	1.73 to 2.16	79.03 to 83.2
10% of fine sands 7.71	5	1.73	77.56
25% of slimes... 7.71

The slimes carried away by the water leaving the distributor tanks and Spitzkasten are deposited in pits or in reservoirs, whence the clarified water returns to the stamps. The following figures (Table III), referring to the Crown Reef mill, show the proportion of the different products, their gold contents and the losses of gold:

TABLE III.

Operations.	Gold Lost per Ton Stamped. Grams.	Gold Recovered per Ton Stamped. Grams.	Per Cent.
Amalgamation—Ore stamped: 180,700 tons.....	10.50	57.20	..
Concentrates cyanided: 5,700 tons, or 3%.....	1.04	5.66	0.11
Sands cyanided: 119,200 tons, or 66%... 3.30	19.07	1.45	7.90
Slimes: 55,800 tons, or 31%.....	1.75	9.53
	15.04	81.95	3.31
			18.03

Mr. Grollet's experiments were made on three ores, two of which were poor, the third an ore from the Transvaal.

The first of these ores was from the Puy-de-Dome, France. It had been concentrated on a special table. The results were as follows:

TABLE IV.

Original Ore. %	Pulp. %	Tailings. %
Silica..... 89.40	16.20	98.10
Silica and clay...	0.74
Alumina.....	Trace
Antimony..... Distinct trace	5.14
Metallic iron..... 4.15	35.70
Ferric oxide.....	Trace
Sulphur..... 5.28	41.66
Lime..... Distinct trace	Trace	0.93
Totals..... 98.83	98.70	99.77
Gold, per ton, (grams)..... 1.50	16.0	Nil

The second of these ores was obtained from North Wales. This ore had been concentrated, like the first, after dry stamping, through a dry screen, on the same special table. The analyses of the ore, of the pulp and of the tailings gave the following results (1000 kilograms of ore gave 100 kilograms of concentrates and 900 kilograms of tailings):

TABLE V.

Original Ore. %	Pulp. %	Tailings. %
Silica..... 98.30	91.30	98.50
Lead..... 0.28	2.27
Metallic iron..... 0.21	2.96
Ferric oxide and alumina	1.20
Lime.....	Trace
Sulphur..... 0.37	4.01	Nil
Totals..... 99.16	100.54	99.70
Gold, per ton (grams).... 3.0	34.0	Nil

The third of these ores was obtained from the Transvaal. It had been concentrated in a similar manner. It gave the following results (a ton of ore yielded 46.5 kilograms of pulp and 953.5 kilograms of tailings):

TABLE VI.

Original Ore. %	Pulp. %	Tailings. %
Insoluble gangue..... 93.100	5.70	97.20
Iron..... 3.010	43.16	2.06
Alumina..... 1.320	Nil	Trace
Lime..... Trace	50.22	Nil
Sulphur..... 1.372	99.08	99.26
Totals..... 98.802	99.08	99.26
Gold, per ton (grams).... 20.0	390.0	2.0

These experiments show that in many cases all or nearly all the gold contained in an ore may be concentrated, and that it is separated into two classes—the pulp and the tailings. The washing of the auriferous pulp is carried out in favorable conditions, the filtration not being difficult. As regards the treatment of the tailings, it is only carried out if the gold contents renders it worth while, and this is rarely the case. If it is, the tailings are after treatment washed with the aid of a filter press.

C. ROASTING.—The roasting of ores is either oxidizing or chloridizing.

(a) OXIDIZING ROASTING.—Oxidizing roasting is based on the following principles: When an ore or mineral product, consisting essentially of metallic sulphides, is placed in a bed some centimeters in thickness, 0.150 to 0.200 meter, in a reverberatory furnace (fixed reverberatory furnace, reverberatory furnace with movable hearth, or reverberatory furnace with rotating cylinder), and submitted to a temperature sufficient to give effect to the affinity of the sulphur and of the metals that are combined with it, to the oxygen of the air introduced into the apparatus, a liberation of sulphurous anhydride is brought about, and this has but little tendency to combine with the metallic bases, and, consequently, free oxides and metallic sulphates are the products that are formed.

Many metallic arsenides behave in an analogous manner in the same circumstances. Simultaneously with the liberation of arsenious anhydride, free oxide and metallic arseniates are formed, chiefly the latter, and, more rarely, arseniates.

The sulpho-arsenides and the mixtures of metallic sulphides and arsenides similarly bring about a liberation of sulphurous and arsenious anhydrides, and the formation of either metallic sulphates and arseniates, or of free oxides and arseniates.

In certain circumstances metallic antimonides may be obtained—as, for example, when the ores to be roasted are metallic sulphides containing in the state of combination or of mechanical mixture some antimony sulphide. The latter is charged by roasting into a combination of antimony acid (Sb_2O_5) and antimony peroxide (Sb_2O_4), while part of the antimony is liberated in the state of antimony peroxide.

(b) CHLORIDIZING ROASTING.—The reagent most generally employed in the metallurgical processes of roasting is the oxygen of the air. This plays the most important part in all the operations designed to bring an ore, or crude product, to a state of oxidation suitable for the subsequent treatment.

In certain cases, however, the substances are acted upon, in addition to oxygen, by another body—chlorine, in the form of sodium chloride. This agent is employed in the metallurgy of gold, when it is desired to convert certain metals (silver, lead, copper) or certain bases (lime, magnesia) into chlorides, so that during the chlorination the free chlorine can no longer act upon them.

(c) LOSSES OF GOLD DURING ROASTING.—When the ores or crude products, consisting essentially of metallic sulphides or sulpho-arsenides containing gold, that metal remains in the state of a simple body extremely finely divided in the product of the oxidizing roasting, while the other metals are changed into oxides, sulphates or arseniates. In fact, at the temperature of roasting, the gold does not experience any oxidizing

action either from the oxygen of the air or from the vapors of free sulphuric acid. Nevertheless, experience in various quarters has shown that during the metallurgical roasting of auriferous matters losses of gold are produced. Numerous experiments on this subject have been made by Mr. Grollet. He has roasted at low or high temperatures, for long or short periods, mixtures of finely divided metallic gold obtained by precipitation by sulphuretted hydrogen, or metallic sulphides and arsenides rich in gold, produced artificially, with ores or other non-auriferous substances. The results of these experiments have led him to admit that the loss of gold is produced only when the roasting is carried out too energetically, and when the volatile products of the roasting carry with them very thin particles of gold. It is probable that when a considerable loss of gold is thought to have been observed in roasting, the inference is really based upon the results of an imperfect average assay or an erroneous quantitative determination of the metal contained in the ore roasted. Aidarow, in a paper on the non-volatilization of gold in the roasting of crude matters (Bergwerksfreund, Vol. XVIII, p. 1), directed attention to the difficulty presented by the exact determination of gold by the dry assay—that is to say, by fusion with pure lead and cupellation, a difficulty resulting from the loss of the gold particles, either mechanically retained by the sides of the crucible in which the fusion is effected, or absorbed in the cupel.

(TO BE CONTINUED.)

Lubrication of Gearing.

Lubrication of teeth of gearing is a subject worth attention. The idea that waste lubricants from bearings, engines and machinery generally are good enough to apply to gear teeth is based on the conception that gearing must wear by reason of frictional contact in transmission of power—that its life is dependent solely upon how well proportioned for its work, without regard to lubrication. But there is a difference between the lubrication of a bearing for a revolving journal and that of gear teeth, in which even the rolling effect at pitch line may be lost through inaccuracies of ordinarily constructed gear teeth. Gear teeth are constructed to have little side clearance between the teeth when engaged. Perfect working gear teeth would be those without side clearance.

Its freedom from tendency to form a built-up deposit admirably adapts petroleum products for lubrication, while it is equally evident from the action of gearing described a lubricant must possess tenacious qualities to adhere and build a deposit on the working surfaces of teeth, thus preventing metallic contact and consequent wear and noise, and with a like deposit on the opposite sides of teeth reduce side clearance and form a cushion for backlash, greatly

decreasing noise and destructive action. The accompanying illustration shows in the heavy lines on the sides of the teeth the effects of application of gear shield, in which the above described results are attained, evidenced in the prolonged life and greatly decreased noise of gearing on which it has been used in widely varying lines, from the fast running motor gearing on street cars to the most ponderous and heavily dutied gearing of rolling mills. Its efficiency has been demonstrated on gears not in themselves severely dutied, but subjected to dusty, gritty or atmospheric conditions, causing rapid wear. This gear shield is manufactured by The Ironsides Co., Columbus, Ohio.

Presence of Gold in Iron Pyrites.

How gold came to be present in quartz veins is very hypothetical. All that can be said is that it was evidently deposited from the solutions which gave rise to the formation of the inclosing quartz; and this appears the more evident from the presence of that metal in pyrites inclosed in siliceous incrustations, as well as from the fact of large quantities of gold having been formed in the interior of the stems of trees, which in deep diggings are often converted into pyrites. The constant pressure of iron pyrites in auriferous veins, and when so occurring its invariably containing a certain amount of gold, suggests the possibility of this sulphide being in some way necessarily connected with the solvent by which the precious metal was held in solution. It has been shown that finely divided gold is soluble in the sesquichloride of iron, and more sparingly in the sesquisulphate of that metal. It is also well known that iron pyrites sometimes results from the action of reducing agents of the sulphate of that metal. If, therefore, sulphate of iron, in a solution containing gold, should become transformed by the action of a reducing agent into pyrites, the gold, at the same time being reduced to the metallic state, would probably be found inclosed in the resulting crystals of that mineral—Prof. Whitney.

Oil Furnaces for Assaying and Melting.*

CHARLES BRENT.

In view of the fact that the use of oil fuel in many departments of metallurgy has been greatly extended during the past two years, a few practical notes on the use of oil, as applied to the furnaces necessary in the assay office and melting room, may be found of interest.

The furnaces described were designed by the writer mostly for use in my own laboratory and are the result of practical experiment in the use of oil for fuel for the past twelve years. Petroleum, either as gasoline, refined oil or fuel oil, can be used in any of the furnaces, and it will be found to possess advantages over other fuel wherever steam or compressed air can be obtained, or even comparatively light pressures from an ordinary blower. It will be found in most cases more economical than either charcoal,

nary soapstone footwarmer, hored and fitted with an iron ring for convenience of handling. Behind and above the crucible chamber is the muffle chamber, C, containing the muffle B. The walls of this chamber hug the muffle at the sides, the top and the end within $\frac{1}{4}$ -inch and the opening for the escape of the products of combustion is placed in the middle of the muffle. A small door, lined with a sheet of asbestos, closes the opening to the muffle, and a small shelf beneath this adds to the convenient working of the furnace.

This furnace can, with the right quantity of oil and air at eighty pounds pressure, be raised to the temperature for fusion for assays in less than ten minutes, and the muffle will be found at a suitable temperature for cupellation in fifteen minutes. Work can be carried on simultaneously in both crucible chamber and muffle, as the jet sweeps between the crucible and strikes at once into the muffle chamber. This furnace will make a set of fusions in twenty minutes, and by the use of a second jet of compressed air, E, into the mouth of the muffle, a set of cupellations on 10-gram buttons can be made in from seven to ten minutes. The fuel burned will be less than three-quarters of a gallon of oil, which, after the furnace

the oil is turned off, and there is no further consumption of fuel.

Fig. 2 (Plate 3) roughly illustrates the form of burner used by the writer with an ordinary pressure blower giving a pressure of 6 to 10 inches. The oil comes to the blast pipe through pipe A, its flow being regulated by stop cock B. The blast pipe is contracted to a nozzle, E, and the end of the pipe C is flattened, as shown in diagram. Fig. 3 (Plate 3) shows the ordinary high pressure burner which can be bought now from a number of firms manufacturing oil-burning furnaces for steam raising and forge work.

The air enters through a passage, H, its flow being regulated by needle B. It issues through the central orifice, F, and sprays the oil entering through a passage, C. The flow of oil is regulated by the cap E, which, when screwed up completely, closes the opening D of the passage C, without interfering with the passage of the air.

The furnace designated as Fig. 1 (Plate 2) was designed for washing and drying the gold precipitate from the chlorination process and melting the dried product. The precipitate is dried and washed in a

coke, coal or gas, and wherever ordinary precaution is used, the risk from fire or explosion will be reduced.

The saving of time and labor in the use of oil fuel, as compared with solid fuel, must be known to be properly appreciated, and the ease of manipulation and the freedom from dust and ashes and outside heat will recommend this fuel.

The construction of all the furnaces is the same, in that they are all constructed of sheet steel, of suitable weight, according to the size of the furnace. The shells are lined with a plastic mass, composed of four parts of old assay crucibles ground to about 20 mesh and one part of good finely-ground fireclay. This mixture should be worked up with a small quantity of water and put in as stiff as it can be handled. After a day or two drying, a light wood fire is put in the furnace until the lining is thoroughly hard.

A little caution must be used the first time oil fuel is applied; but if the furnace is thoroughly dried, the heat may be pushed at once to the extreme limit required.

On cooling, the lining will be found pitted together by the small quantity of slag from the broken crucibles and will usually be free from cracks. Should any develop, they should be filled with a thin mixture of the lining material. This lining burns as hard as porcelain, and, as there are no ashes from solid fuel to slag the walls, it will be found practically indestructible.

The combination furnace shown in Fig. 1, Plate 1, was designed to hold six Battersea crucibles, size E or F, and a size J or H Battersea muffle. In the diagram A is the crucible chamber, with an opening below and in front to admit the jet of oil and steam or air. A convenient cover for the chamber is an ordi-

nary soapstone footwarmer, hored and fitted with an iron ring for convenience of handling. Behind and above the crucible chamber is the muffle chamber, C, containing the muffle B. The walls of this chamber hug the muffle at the sides, the top and the end within $\frac{1}{4}$ -inch and the opening for the escape of the products of combustion is placed in the middle of the muffle. A small door, lined with a sheet of asbestos, closes the opening to the muffle, and a small shelf beneath this adds to the convenient working of the furnace.

The furnaces designated as Figs. 2 and 3 (Plate 1) were designed to be worked together in an assay office handling ordinarily 100 assays and upwards per day. Fig. 2 is a crucible furnace designed to take in twelve size E or F crucibles in the chamber H, which is covered with three soapstone covers, B. The jet is admitted through an opening at the bottom and in front and the products of combustion escape through openings between the covers, B, which are arranged to slide apart for this purpose. If it is desired to hasten up the melting of the hack set of crucibles, an opening is left over them by sliding the covers apart. A suitable sheet iron hood about 3 feet above the furnace is connected with the chimney and serves to carry off all fumes, without interfering with the work at the furnace. This furnace will burn a gallon of oil every hour and will turn out a hatch of fusions every twenty-five minutes.

FIG. 3.—This is a double muffle furnace designed to hold two size K muffles, and the regulation of the heat in the two muffles is accomplished by the proper combination of the jet below and the draft above. Ordinarily the bottom muffle will become much hotter than the upper one; but, on increasing the air in the jet below and opening the draft above, the two muffles can be regulated to the same temperature. The furnace will burn from three-fourths of a gallon to one gallon per hour of oil, will be hot enough for cupellation in either muffle in twenty minutes and hot enough for scorification in twenty-five minutes. An obvious saving in fuel is made in furnaces of this size, as, in the oil furnace, the moment the work is done,

series of trays on the hearth B of the furnace, any part of which is accessible by sliding the covers, C. After drying and washing, the product is transferred while hot to the plumbago pot, A, which has during the washing attained a full melting heat. Any fume or dust is retained in an enlarged section of the shaft pipe, which can be opened and cleaned at suitable intervals.

Fig. 2 (Plate 2) shows a double-jet furnace, designed for melting hulsion. The jets form a tangent to the surface of the melting pot and form a whirling flame between the pot and the furnace walls, the products of combustion escaping through a hole in the center of the furnace cover. This furnace will be found rapid and convenient to use, especially on hulsion which requires a good deal of slagging and refining. Any melter who has stood over an ordinary coke furnace, filled with incandescent fuel, for an hour, will appreciate a melting furnace that at a touch can be so cooled off as to be worked over with no discomfort from either light or heat. The furnace can be placed anywhere in the melting room, requires no expensive smokestack, and takes up but little room. The furnace itself is ordinarily only 4 inches more in diameter than the crucible it holds, and is only about 4 inches higher. The rapidity of melting must be also taken into consideration. The writer has melted a thousand ounces of retort sponge and slagged it thoroughly clean in less than an hour with the consumption of $1\frac{1}{4}$ gallons of fuel oil, and has repeatedly melted twenty pounds of brass in less than half an hour with less than half a gallon of fuel.

Fig. 1 (Plate 3) shows an oil reservoir, with screen near the top and gauge glass on the side and connected below to a filter, which is simply an enlarged section of the supply pipe filled with coarse, clean sand. It will be found an important matter to free

*Condensed.

the oil from every trace of suspended matter, especially when using the high pressure jets, as the openings are so minute that a very small particle of grit will stop the flow of the oil. It will be found convenient to locate the oil reservoir at least 10 feet above the jets, to keep a proper head of oil on the burners.

This Paper's Wrapper.

Since this paper began being placed in the mails rolled, complaints have been received from subscribers regarding annoyance in opening the wrapper.

To obviate such inconvenience a new style of wrapper is adopted.

The attention of our subscribers and the trade generally is respectfully directed to the peculiar feature of the wrapper in which this paper is mailed each week. These wrappers have pasted inside of them a small black thread running from one end to the other, for the purpose of cutting the wrapper open automatically. As shown in the illustration, one end

of this thread should be grasped in one hand and the paper in the other, and with a sharp pull the thread cuts the wrapper open and the paper unrolls itself. Anyone who has gone to the trouble of trying to tear the wrapper open with the fingers, or even to cut it open with a knife, will appreciate at once the value of the device described. The new system goes into effect with this issue.

Water From Miner's Ditch.

The accompanying picture is interesting from the point of view of practical mechanics—a pump house and workshop, which show how water from a miner's ditch may not only be taught to pump itself to an elevation above the ditch, but furnish water for

The Pump House and Workshop at Jackson, Amador Co., Cal.

the mine shop besides. By means of a turbine wheel a pump is worked and saws and grindstones revolved. The outfit of turbine and pump was made in the vicinity by Knight & Co. of Sutter Creek, Cal. Its capacity at full stroke is 10 miner's inches. The turbine is 12 H. P.

A Multiplication-Addition Table.

The following table from Popular Mechanics is interesting to look at and ingeniously constructed:

1 time 9 plus 2 equals 11.
12 times 9 plus 3 equals 111.
123 times 9 plus 4 equals 1111.
1234 times 9 plus 5 equals 11111.
12345 times 9 plus 6 equals 111111.
123456 times 9 plus 7 equals 1111111.
1234567 times 9 plus 8 equals 11111111.
12345678 times 9 plus 9 equals 111111111.
1 time 8 plus 1 equals 9.
12 times 8 plus 2 equals 98.
123 times 8 plus 3 equals 987.
1234 times 8 plus 4 equals 9876.
12345 times 8 plus 5 equals 98765.
123456 times 8 plus 6 equals 987664.
1234567 times 8 plus 7 equals 9876543.
12345678 times 8 plus 8 equals 98765432.
123456789 times 8 plus 9 equals 987654321.

Treatment of Oxidized Ore.

In the vicinity of Victor, Cripple Creek district, Colorado, many of the veins are narrow, the gold in some instances occurring along the fracture planes of the rocks, these fracture planes becoming the narrow veins. In some cases, when thoroughly oxidized, the vein matter becomes a gouge which separates easily from the walls, and the veins being so narrow that a good deal of the wall rock must be broken down. The value of this broken material, taken as a whole, is low—too low to pay for working it—but the following method is used to concentrate the valuable gouge matter and make a good grade of material: The ore as it comes from the mine is put over bar screens having 1½-inch spaces. The ore going over the screen is usually considered waste, although roughly handpicked before going to the dump. What falls through the bar screen goes to a wire cloth screen with ¼ to 1-inch openings situated directly below the bar screen or grizzly. The material which passes through this wire screen contains all the loose fines (the gouge), which carry the value, and this grade of ore is generally high grade enough to ship. What passes over the wire cloth screen is mostly barren rock, to which, however, adhere particles of rich gouge. This material goes to the washer, which in

the larger plants is usually a revolving screen, having ¼ to ½-inch perforations, on which the ore is fed with a plentiful supply of warm water. The fine gouge matter is washed through the revolving screens and caught in settling boxes, where the excess of water is drained off and the resulting mud dried by means of properly arranged steam pipes beneath the boxes. In smaller plants this washer is a shallow rectangular box, in which is placed a perforated screen through which the fines collect in the lower part of the box. The ore is worked over on the perforated plate by means of a shovel, water being added, until the gouge is all worked off. Then the coarse rock is shoveled off and a fresh lot thrown on the screen. When the lower part of the box, below the screen, has become filled with fines, the screen is removed and the fines are shoveled on the drying floor to be dried. The fines obtained in this manner generally run three or four ounces gold per ton. The separated coarse rock runs about .15 ounce per ton.

Hydraulic Mining Failures.

If there is one branch of mining more than another that calls forth the ability, taxes the ingenuity, and at the same time exposes the weak points and ignorance of the mining engineer, it is the branch referred to in general as hydraulic mining, covering placer mining and alluvial mining, and, of late years, including gold dredging. Without doubt more money has been wasted and more ignorance displayed in connection with such ventures than any other kind of mining. It seems to be taken for granted, even by many men who have world-wide records as successful financial and business men, that mining ventures are easily handled—that it requires little or no training to successfully manage them, and it is a common occurrence to find mines in which large sums are invested in the hands of some friend of the president or relation of a director, who has been brought up in a large city and in many cases has never seen a mine, and has neither practical training nor experience. There are innumerable monuments of failures in which the above state of affairs may be traced for cause, in which many well-known successful financiers and business men have squandered fortunes of their own and of their friends. The sooner mining investors realize these facts the sooner will mining of all classes become a more legitimate form of investment.

The different forms of mining entitled to be grouped under the head of hydraulic mining include the most interesting and fascinating methods, and many of the various problems in connection with them that are continuously cropping up will always make this branch of mining the most enticing to professional mining men, as well as to investors.—George H. Evans in Cassier's Magazine.

AUSTRALIA is not a consumer or buyer of silver,

but a heavy producer and seller. London will be the chief silver market so long as England controls the trade of the East. Ultimately, of course, San Francisco will be the principal shipper of silver. That will be when the Pacific ocean becomes an American lake.

A 50,000-Volt Transmission System.

Twenty miles east of Helena, Mont., the Missouri River Power Co. has located its 50,000-volt power plant and transmission system at the town of Canyon Ferry. Ten years ago the project was first taken up; the present plant is the result. At the canyon's mouth a 480-foot dam has been thrown across the Missouri river and gives a working head of 30 feet, the canyon varying from 400 to 700 feet in width. It is about ½ mile long. There is sufficient water in the river at all seasons to develop a minimum of 10,000 H. P. Four years ago the plant was begun. It then consisted of four 750 K.W., 550-volt, two-phase generators, with two 90 K.W. exciters, the capacity of the plant being 4000 H. P. In the fall of 1900 the present plant began to take shape, the idea being to enlarge the old one to a capacity of 10,000 H. P. Six extra 750 K.W. generators, with the proper accompaniment of exciters, transformers and other apparatus, were therefore installed, to be driven by 45-inch turbines. All generators in the power house are direct connected to the wheels, flexible couplings being used throughout. With the new generators there was also installed a 225 K.W., 150-volt exciter, driven by a separate wheel, and a 115 K.W., 150-volt exciter, driven by an induction motor. The power plant now consists of ten 750 K.W. direct connected generators, with four exciters, of which two are 90 K.W. machines, direct connected to separate wheels, one a 225 K.W. machine, with a separate wheel, and one a 115 K.W., motor-driven generator. To make the plant uniform throughout, the four old generators have been overhauled and changed from two-phase to three-phase. Power is sent to Butte at 50,000 volts and to Helena at 10,000. Among the customers of the power company are mining, smelting, lighting and power companies in Helena, East Helena, Anaconda and Butte, Mont.

Compressed Air for Mine Haulage.

During the last ten years a great many mines have replaced animal haulage with compressed air motors, which lend themselves splendidly to the work desired. There are, in general, two systems—the low pressure system, in which air is compressed to 500 or 600 pounds, and the high pressure system, with air pressure of 2000 pounds and over. The former system can be used in large galleries or tunnels or drifts, where the width is ample and the track is reasonably straight. This permits a large receiver on the motor, 30 to 40 inches in diameter and from 8 to 16 feet long, to be banded with ease. The high pressure system is used where the drifts are narrow or the curves on a small radius, permitting only a small wheel base on the motor. Large receivers are, therefore, impractical, and steel tubes must be used and charged with high pressure air to get sufficient volume.

Compressed air may be used cold on either of these motors, or the air may be passed to small tanks of hot water supplied to the motor at the charging stations.

The air and hot water combination does almost double the work that cold air will do. These motors can carry sufficient air for any ordinary run desired and haul tremendous loads. Two miles and return, with fifteen or twenty loaded cars, is not an extraordinary effort, and from the general results obtained the cost of haulage is from one-half to one-third of the cost of animal power. The air escaping from the exhaust of the motor engine adds to the ventilating effect in the mine, and the whole system harmonizes thoroughly with the power outfit in the average mine.—E. A. Rix in Cassier's Magazine.

The Deep Lake Mines.

State Geologist Lane, who is investigating the temperature of the deep mines of the copper country in the vicinity of Houghton, Mich., has found that the temperature increases 1° in every 160 feet. As a rule, the increase in other deep mines of the world is 1° to every 110 feet. The deepest shafts of the Tamarrack and Calumet & Hecla show a temperature of 86° to 90° above zero. Experiments in deep well borings in lower Michigan give data which would cause a temperature of 130° in these shafts if the rate of increase were so great there. Dr. Lane ascribes the coolness of the lake mines to the great conductivity of the rock strata.

Want Bids on Aerial Tramway.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

DRILL-HOLDING CHUCK BOLT FOR ROCK DRILLS.—No. 704,502; O. H. Bossert, Denver, Colo.

In drill holder for rock drills, combination with drill and drill chuck, of clamp block which fits in recess in chuck, block provided on its under side with semi-circular recess which overlies end of drill; U-shaped bolt, straddling block, members thereof passing through chuck, each member being provided with groove or recess near lower end; yoke having vertical holes and holes at right angles to vertical holes, which intersect same, yoke adapted to fit on depending ends of U-shaped bolt; pins which pass through last-mentioned holes in yoke, and through grooves or recesses in ends of U-shaped bolt so as to lock yoke upon bolt, and wedge which is driven between connecting member of U-shaped bolt and top of clamping block, so as to clamp block upon end of drill, to retain same within chuck.

TANK.—No. 704,539;—E. N. Harmon, Belvedere, Cal.

Tank composed of staves, each having longitudinal edge grooves, and intersecting passage connecting grooves; intersecting passages in adjoining staves being in different planes, all passages and grooves forming, in series, a single continuous waterway; communicating horizontal passages, arranged alternately near top and bottom of adjacent staves.

DUMP CAR.—No. 704,578; E. M. Ray and R. B. McConney, Denver, Colo.

In car of class described, combination of fixed frame portion formed of longitudinal sills and U-shaped transverse metal members which form tie beams for sills and side posts for car, metallic members for tying upper ends of posts together, rock shafts arranged longitudinally of car, one at each side of longitudinal center thereof, dumping hoxes L-shaped in cross-section and substantially U-shaped in longitudinal section secured to rock shafts so that they may be tilted to dumping positions, swinging doors pivotally secured to sides of car frame at or near upper portion thereof with their free edge at or near lower side of car to form closure therefor and for outer side of dumping hoxes, hooked plates provided with rock shafts pivotally secured to outer lateral edge of dumping hoxes adapted to engage with free end of swinging doors and hold same in locked position, lever for operating rock shaft and means for holding it in locked position, means for holding and rocking main rock shafts and thereby tilting dumping hoxes into carrying or dumping positions.

PROCESS OF EXTRACTING COPPER AND NICKEL FROM SULPHIDE COMPOUNDS.—No. 704,640; C. Hoepfner, Frankfort, Germany.

Process consists in oxidizing roasting copper and nickel sulphide ores or mattes, thereby forming sulphurous acid gas and sulphate of copper, dissolving latter and converting it into cupric chloride by means of alkali-metal chloride, converting cupric into cuprous chloride by means of incompletely roasted material and sulphurous acid, thereby dissolving nickel salts from roasted material and leached resi-

dues, removing cuprous chloride from solution and treating new quantities of ore with resulting solution containing some alkali-metal chloride and cuprous chloride.

ORE SAMPLER.—No. 704,853; S. E. Bretherton, Val Verde, Arizona.

Ore sampler consisting of vertical shaft and means for rotating it, spider adjustable on supporting shaft and having radiating arms detachable therewith as specified, arms carrying at their free ends balanced buckets having projections for engaging fixed tripper device dumping buckets, buckets having stop device permitting it to swing in one direction only beyond its balanced position.

COMPRESSOR.—No. 704,914; F. W. Parsons, Elmira, N. Y., assignor to Rand Drill Co., New York, N. Y.

In fluid compressor, combination with two power cylinders arranged side by side, two compression cylinders also arranged side by side, and each in line with one of power cylinders, pistons for cylinders, sectional piston rods connecting pistons in opposite cylinders, one section of each such piston rods being connected to one piston, the sections of piston rods being separable from each other, crosshead for such piston rod, located between corresponding cylinders, provided with inwardly projecting wrist pin, of crosshead guide for each of crossheads having means for resisting lateral stress upon crosshead, transverse crankshaft, intermediate of cylinders, flywheel thereon, and connecting rod connecting each wrist pin with crankshaft, connecting rods each arranged eccentrically of axis of its corresponding pistons and piston rod, and to have path of movement to one side of path of movement of piston rod.

ELECTRIC SMELTING FURNACE.—No. 704,993; F. C. Weber, Chicago, Ill.

In an electric smelting furnace, combination of furnace chamber, several superposed series of electrodes projected laterally into furnace chamber from opposite sides thereof at different planes of inclination, with arcing space between companion electrodes of each series for superposed arcing space to form graded vertical downwardly extended and con-

tinued smelting and arcing space, means for regulating and graduating voltage or temperature of each separate series of electrodes, and feed or delivery spout projected downwardly into furnace chamber in juxtaposition to arcing and smelting space at commencement thereof and having central opening for discharge of material in line with smelting and arcing space for initial subjection of material to heat as it is discharged and final subjection of material in its passage through arcing space.

ROTARY ENGINE.—No. 705,004; W. D. Williams, Fredericksburg, Va.

In multiple engine having ports, one for each engine, valves controlling ports, fixed part having passage adapted to communicate with ports of engines, and an indicator mechanism adapted to be applied to fixed parts.

LEACHING AND EXTRACTION OF METALS FROM THEIR ORES.—No. 704,639; C. Hoepfner, Frankfort, Germany.

Process of treating ores and metallic compounds, which consists in leaching same with warm cupric-chloride solution containing solvent of cuprous chloride in quantity less than is required for saturation, precipitating lead and part of silver chloride formed by refrigeration, reconvert resulting solution into cupric-chloride solution, returning same at higher degree of temperature to material treated, thereby dissolving copper, precipitating any excess of iron by an oxygen compound of copper, electrolyzing solution to recover copper and zinc, returning resulting electrolyte into cycle of operations.

PROCESS OF SEPARATING ALKALI-METAL SULPHATES FROM MIXED SOLUTIONS.—No. 704,036; C. Hoepfner, Frankfort, Germany.

Method of separating alkaline sulphates from mixed solutions, which consists in rapidly cooling same by allowing them to flow into cold solution of chloride while being constantly stirred, using resulting cold solution to reduce temperature of cooling gasses used in refrigerating plant.

Volumetric Copper Determination.

M. F. Repiton, in an article on this subject, recommends the use of potassium ferro-cyanide, instead of potassium cyanide. A N-10 solution is added to a neutral boiling solution of the copper as sulphate, until test drops show up blue with ferrous sulphate. The application of this method to other metals is being investigated by the author, who is continuing his experiments and going into the matter exhaustively. Exact results may also be obtained if a neutral solution of the copper as sulphate, chloride or acetate is precipitated with an excess of a standard solution of oxalic acid. Let this mixture be set aside for three hours, then add a little sulphuric acid and titrate the excess of oxalic acid with a permanganate solution of known relative value, the amount of oxalic acid combined with the copper being calculated by difference. The value of this, in terms of copper, is decided by repeating the process on copper solutions of known strength.

Some Australian Salaries.

In developing the Chillagoe mine Mr. A. Stewart, general manager for three years, drew £10,000 per annum; Mr. Smith, mining manager, three years at £1000 per annum; Mr. Back, managing director, five years at £2500 per annum; Mr. Wienberg, general manager, one year at £4000; five directors, three years at £400 per annum, making a grand total of £58,000.—Gladstone Observer.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

At the Treadwell mines, on Douglas Island, 2 miles from Juneau, with which the mines are connected by hourly steam ferry service, the first stamp mill was put in in 1885 and gradually increased until now there are 800 stamps in daily operation at the Treadwell mines. One of these stamp mills runs through about 3000 tons of ore daily; the tonnage for May was 89,000 tons.

Four associated companies, under one management, are working the ledge—the Alaska-Treadwell, the Alaska-Mexican, the Juneau-Alaska and the Ready Bullion. Manager J. MacDonald is in immediate charge.

Besides the open quarry work, the property is also opened to a depth of 700 feet, with thousands of feet of crosscutting and drifting. In the quarry, now about 1000 feet long, 400 feet wide and sides each 450 feet high, the ore is broken down by the machines and run through 30-foot raises to the 600-foot level of the mine. From this point it is raised to the surface by means of skips. In the deep workings of the Treadwell a system has been put in operation by which but little timbering is done, and which, it is said, has resulted in a saving of 34 cents per ton in the expense of mining. The ore body at the Treadwell is about 400 feet wide, with well defined walls, but the length and depth of the ore has never yet been determined—it is of such magnitude. The ore is a white quartz and very hard. The values are entirely in gold and not visible to the naked eye.

Five years ago the late Capt. T. Mein made expert report on the Alaska-Treadwell, saying that there were 5,000,000 tons of ore above the 220-foot level, and estimating that it would last 100 feet below that level, which would make 7,000,000 tons. At that time he recommended the adding of stamps to bring the total up to its present number, saying that in that way the cost of mining and milling the ore should not exceed \$1 per ton.

ARIZONA.

The Troy Copper Co. will turn over the property to the Troy-Manhattan Copper Co., recently incorporated under Maine laws. The original Troy Co. was incorporated under West Virginia laws. The exchange will be made on the basis of five shares of new stock for four shares of the old. The consolidation of the Troy and Manhattan companies gives a combined area of 1100 acres, upon which are four mines. The directors have voted to increase the smelter capacity to 250 tons. The enlarged plant will, however, largely turn out matte.

COCHISE COUNTY.

The Hecla & Arizona G. & C. M. Co. has been organized to operate in the Bisbee district. J. M. Carroll, general manager. The company has eleven mining claims on Iron mountain.

General Manager Bagge of the Black Diamond C. M. Co. has the 200-ton smelter ready to be blown in upon the completion of the tramway, which will be ready August 15. The tram is 3 miles in length and has a carrying capacity of 600 tons per day of twenty-four hours.

The Copper Bell mines at Gleason have shut down on account of attachments by Tombstone and Pearce firms.

Eureka M. & M. Co. of Tombstone, O. B. Steen manager, has properties near the line in the Huachuca mountains, across from the Cananea. There are seven claims in the group and there has been 3000 feet of development work done on them. They are pushing work on the 20-ton concentrator. It will be in operation September 1 and concentrate the low-grade ores. The higher grade will be shipped as taken from the mines.

GILA COUNTY.

At Globe the Old Dominion mine in June produced 820,000 pounds of copper. A production of 800,000 pounds per month has been averaged through the year.

R. M. Foree of the Arizona-Colorado C. B. & G. M. Co. has assay of sample of ore from the Baltic: Gold \$39.29, silver 408.10 ounces, copper 9%. The company's properties are 3 miles from Globe. They will sink to water level. At the United Globe the Gray shaft is unwatered.

GRAHAM COUNTY.

C. H. Merrill is Supt. Graham County M. Co., a reorganization of the old Spenazuma M. Co. Twenty-five men will be employed. The property is near Solomonsville. The claims are the Mocking Bird, Fenton and Everett. Schuyler S. Moore is general manager.

MARICOPA COUNTY.

At Phoenix are incorporated the Chicago-Alaskan G. M. Co., by M. E. Parenteau, R. M. Griffith, F. E. Hayner, and the Socorro Mine Co., by S. P. Anderson, D. G. Adams, P. Gray, A. Chapelle of Chicago.

MOHAVE COUNTY.

At the Homestake mine, 3 miles south of Kingman, bigger ore bodies are being opened. The mine will soon be fitted with a milling plant to handle the ore from the property on a large scale. The average of the ore so far opened up is \$8 per ton and the estimated cost of mining and milling \$2 per ton.

The Chloride smelter is being tested preparatory to the contractors turning it over to the company.

The Kingman Miner directs attention to the fact that Mohave county is a producer of copper. The smelter returns of the Grand Gulch mines by Supt. Jennings show that from November, 1899, to date there has been shipped to the smelter 1000 tons of ore, the average of which was 44% copper, 5 ounces silver and \$1 gold. For this nearly \$100,000 was received from the smelter. The wagon haul from the mine to the railroad is 180 miles, for which haulage \$23 per ton is paid. Railroad freight amounts to \$6 per ton, a total haulage charge of \$29.

SANTA CRUZ COUNTY.

In the Apache Chief mine, Tyndall district, Santa Rita mountains, the shaft has water at a depth of 348 feet, developing at the same time a body of ore.

YAVAPAI COUNTY.

Manager E. W. Platt, Illizona M. Co., has two shifts drifting on the 100-foot level. He intends putting in two power drills, to be run by gasoline. His address is Kirkland.

The board of equalization of Yavapai county has raised the assessment of the United Verde Copper Co. of Jerome from \$625,000 to \$1,200,000.

The Carrigan group, near Congress, is being worked by the Senate Co., O. F. Woodward, C. N. Kenney, S. H. Hooker and C. A. Akers. The property was bought March 12, 1902. A depth of 300 feet has been made and 400 feet of drifting done. At the 120-foot level and at the 220-foot level drifts have been run. As soon as the 320-foot level is reached the present force of twenty-five men will be increased to seventy-one.

CALIFORNIA.

AMADOR COUNTY.

The 20-stamp mill and surface works of the Wheeler mine, near Plymouth, were totally destroyed by fire on the 18th inst. The property was owned by the Western Penn. M. Co., and was not in operation.

Thirty stamps are in operation at the Wildman mine, near Jackson.

The Standard Electric Co. has begun the survey for the new power line from its plant at Electra to Sutter Creek.

BUTTE COUNTY.

The Kaiora M. & M. Co. has incorporated; principal place of business, Phoenix, Ariz.; E. K. Wood, D. M. Tomblin, J. E. Spencer.

CALAVERAS COUNTY.

(Special Correspondence).—Increased interest has been added to the present favorable outlook for deep mining at Angels through the prospects obtained by the Oriole M. Co. in sinking on the Thunderbolt mine, near old camp Los Muertos. Their shaft is now down 630 feet, and 250 feet south from which, in the 500-foot level, the company have ore on the vein 6 feet wide. Returns from the samples taken have not yet been had owing to pressure of work in the local assay office. In the north drift on the same level at 400 feet from the shaft they have a body of low-grade ore. These prospects indicate another addition to the list of deep paying mines in that vicinity.

The Ghost mine, which has been pumping now about two weeks, has the main shaft about free from water, and the Drake Co. will soon recommence underground work.

The Last Chance, a parallel vein thereto, is now working twenty-five men, with good prospects. This is the property recently bonded to Salt Lake people through Messrs. Street & Higgins.

Angels, July 22.

A new hoist goes on the Fannie Marie mine at Glencoe. Supt. C. H. Blake will have a 10-stamp mill in operation in September.

Near San Andreas, at the Watcher mine, a hoist is being erected and an incline shaft run.

In the vicinity of Angels, at the Last Chance, men are sinking and arrangements are being made for a hoist capable of 2000 feet.—At the Melones sixty stamps are in operation. The new 8-ton electric engine will haul eight 6-ton ore cars from the tunnel to the ore bin, 2200

feet.—A new 25-stamp mill at the Oriole is projected.—The shaft at the Sultana mine is down 600 feet.—The Altaville shaft is down 423 feet. This shaft, including engine, hoiler, hoist, gallows-frame, timbering and labor, has been put down at an average cost of \$23.20 per foot; it is a two-compartment and manway shaft.—At the Benson mine sinking is going on. A hoist capable of sinking 1000 feet is up.

DEL NORTE COUNTY.

M. E. Horr has been examining the properties owned by the Elkhorn M. Co., sixteen claims 80 miles south of Grant's Pass, it being necessary to take the stage from that point to within 3 miles of the property, and to cover the remaining distance by trail. The placer ground is formed by a basin, walled in by the mountains, and the black sand in the cavity showing with flake gold.

KERN COUNTY.

The Miner says men are stringing wires between Garlock and the Mammoth Coal Co.'s mine; a 30 H. P. dynamo is on the ground. The Mexican miners have been discharged and places taken by Americans. The shaft is down 140 feet; drifting on a 12° rise.

The Yellow Aster M. Co., Randsburg, has borrowed \$100,000, securing the payment thereof by a mortgage of some of the property, payable in one year.

The Boston & Kern River M. Co. has incorporated; principal place of business, Portland, Me.; T. W. Pack, B. E. Kemp, G. M. Barney, H. M. Verrill.

LOS ANGELES COUNTY.

The La Crescenta M. Co. has incorporated in Los Angeles; W. Haerle, P. Walters, B. W. Lee, G. W. Eddy, A. R. Young.

MARIPOSA COUNTY.

The Hite Cove mine has been bought by San Francisco men, who will operate it. F. W. Krogh, of the Krogh Manufacturing Co. of San Francisco, is interested in the property.

MONO COUNTY.

At Lundy Manager Pierce in the new tunnel of the Crystal Lake M. Co. is reported to have 4 feet of paying ore 1808 feet from the mouth of the tunnel.

In the Standard Con. mine at Bodie, for the week ending July 12th, 437 tons of ore were crushed; average assay vanner tailings, \$7.04; concentrates produced, 1.40 ton; assay value, \$112.35; amalgam produced, 2048 ounces; assay value, \$2.67 per ounce.

NEVADA COUNTY.

By Sept. 1 it is expected that the new 20-stamp mill at Allison Ranch will be ready.

The old chlorination plant at the Delhi mine has been repaired and about 5000 tons of sulphurets on the dumps will be worked by the Pioneer Reduction Works of Nevada City.

Nevada county will have a fine mineral display at the Ferry Building, San Francisco, during the Pythian festivities next month. Chairman Dunlap states that arrangements are completed for a \$250,000 gold brick from the Selby Smelting Works.

F. DuLmaine is Supt. the Normandie mine at Deadman's Flat. Men are removing the steam hoist and pumping plant from the Diamond property for the Normandie.

The Bay Counties Co.'s property in the Nevada county division is reported in fine condition. A new stone sub-station has been completed which supplies power to operate the Nevada County Traction Co.'s electric railroad. The Colgate power house has been practically completed. The Yuba power house has been in operation under almost a constant full load and has shown great capacity. The demand for electric power to operate gold dredgers at Oroville has increased.

Grass Valley reports the finding of a pocket by J. & R. Gassaway, worth over \$7000, at Deadman's Flat.

PLACER COUNTY.

The Colfax Sentinel says W. R. Russell of Boston is at the head of the company which bought 7 miles of channel below Forest Hill. The tunnel to work the property is being run at Peckham Hill, 1100 feet below the level of the town of Forest Hill. Fifteen men are employed. Suitable machinery will be put in.

The Bonnie Bee Q. M. Co. of Dutch Flat, H. A. Frost secretary, will put a 10-stamp mill on its property.

SAN FRANCISCO COUNTY.

The Mt. Boliva G. M. & M. Co. has incorporated in San Francisco; F. D. Hopkins, F. J. Cardozo, R. E. Leif, L. J. Charlevella, H. P. Griffith, G. W. Toohy.

SAN DIEGO COUNTY.

The Julian Con. M. Co. and the Owens mine, including the Helvetia and High Peak, are bonded to Eastern men.

SAN LUIS OBISPO COUNTY.

The Madrone Quicksilver Co. is incorporated in Los Angeles to work properties 16 miles from Cayucos. A ten-pipe retort is put in and the mine is paying its way. In the tunnel 200 feet of work has been done. The cinnabar ore is found in the serpentine rock. The average is 24%. The company will place an order for a twenty-ton furnace. There was shipped from the mine last week twenty-one flasks of quicksilver, the result of two months' work.

SHASTA COUNTY.

The Redding Searchlight says "209 mining claims on Pit river have been transferred to the Electric Iron & Steel Co. of San Francisco by Esterle, Smyth, Bruson and Hall."

Three ore trains are running between the Iron Mountain mine and Keswick smelter.

E. W. Hayden at Redding says he has a bond on the 400 acres comprising the Dakin tract for a company composed of San Francisco and New York people. The terms of the bond required that two dredgers be operated within ninety days. Prospect drills will be put to work.

In Old Diggings the Central gold mine, A. A. Anthony Supt., has an upraise from the tunnel 210 feet to the surface, making good ventilation. The upraise shows good ore nearly all the way up.

Three years labor, involving an expenditure of \$12,000 in the Evening Star mine, owned by Panter & Litsch, has been put on a 1400-foot tunnel to tap the ledge.

H. C. Woodrow has resumed work at the Texas mine.

The Shasta May Blossom C. M. & S. Co. has incorporated; principal place of business, Phoenix, Ariz.; M. B. and M. Lindley, L. A. Booth.

T. F. Lawson, a copper share promoter of Boston who brought out the Trinity Co., says: "In all probability on the first day of next January the price of copper will be established the world over at 15½ cents, established in a way that will be self-evident to all, producer as well as consumer, and the public, that it is established legitimately and for all time, and that the stocks representing good copper mines are to be made conservative, legitimate investments upon a permanent basis of 6%, 5% and finally 4% net returns, which will enable more than the doubling of the present market price of the copper stocks."

The Mountain Copper Co. want their tax assessment reduced from \$1,535,215 to \$734,215, but the county board declined to make the reduction.

During the hearing the information was elicited that the drop of 4 cents in the price of copper had deprived the corporation of two-thirds of its net profits; and if the company desired to sell its holdings at the present time, a better price than \$734,215 could hardly be obtained. In the past five years the Mountain Copper Co. had earned \$5,416,000 on an original investment of \$6,250,000. The annual net earnings of the company were as follows:

1901	\$1,716,000
1900	1,300,000
1899	1,500,000
1898	600,000
1897	300,000

Total.....\$5,416,000

During 1901 the price of copper was about 16 cents per pound, and under those favorable circumstances a net profit of \$1,716,000 was realized. Manager Wright's estimate of the profits to accrue during the current year, with copper at 12 cents per pound, was \$610,000. The depreciation of copper was not the only loss to the company from the year 1901, as fire in the mine had rendered inaccessible large bodies of ore. The amount of ore blocked out and actually accessible in the mine on March 1, 1902, was given at 538,635 tons, which, at an estimated value of \$2.65 net per ton, would give a value of \$1,587,382 to the immediate ore supply. Against this sum Manager Wright charged the cost of the present equipment of the company, which the statements showed was \$977,784, leaving a net reserve ore supply valued at \$549,598, upon which he had based his estimate of \$332,000 for the reserve supply of ore, after deducting a certain percentage for possibility of loss or depreciation in values from the estimated values by reason of the fire. The property was bought in 1895 and the reduction of the ores begun January 1, 1897. Two failures had resulted before a satisfactory method of reduction had been discovered. The legal representative of the company referred to the assessment of the Bully Hill M. & S. Co. as something over \$448,000. He said it was stated that the De Lamar property is or was earning from \$100,000 to \$150,000 a month. They were producing bullion said to be worth \$1 a pound.

SIERRA COUNTY.

Supt. E. Squier at the Tabor mine, near Gibsonville, has 3000 feet of the tunnel in and has pierced the rim of the channel and struck pipe clay, with the bedrock still pitching. He will run the tunnel 100 feet farther and then sink to bedrock.

SISKIYOU COUNTY.

The Yreka Journal hears of the organizing of a company to reopen the Greenhorn blue gravel mine, which has been a good paying property.—Supt. Cook of the Punch Creek mine at Humburg has ore paying \$16 a ton, with a 2-foot ledge. His mill is running constantly.—Hydraulic mining at Humburg bar, Sciad and other points on the lower Klamath, is suspended in most of the claims, the water giving out.—The Quartz Valley hydraulic mines are still running, with a good supply of water to keep the giants and hydraulic elevators in constant operation. Supt. Brokaw expects the supply to last several weeks longer.—At Etna the Ball mine is closed owing to lack of water. There will probably be improvements made, to be ready for the fall run.

SOLANO COUNTY.

At Mare Island, the Atlantic, Gulf & Pacific Co., New York and San Francisco, submitted the lowest bid at 17 74 cents a cubic yard for 100,000 cubic yards of dredging at the navy yard. The West Coast Dredging Co., San Francisco, submitted the only other bid, 18.69 cents a cubic yard.

SONOMA COUNTY.

The Sonoma Con. Co. has incorporated; principal place of business, Santa Rosa; C. Winters, S. S. Bogle, F. H. Newman, L. V. Hitchcock, E. C. Barham.

TRINITY COUNTY.

G. L. Carr has fifteen men on the Yellow Rose of Texas.—The Golden Jubilee shows a new 6-foot ledge of ore that averages \$20.—In the Dorleska mine a 3-foot ledge of high-grade ore has been struck in the lower tunnel.—Two giants are at work on the Nash mine, the property of the Trinity G. P. M. Syndicate.—The Strode mine has fifteen men at work.—Meade Bros. mill, 7 miles above Carrville, is in operation.

F. P. Burris is acting Supt. Valencia C. M. Co., east fork of New River. The company owns some copper claims in the New River section. C. S. Laumeister of San Francisco is president. It is the intention to develop.

TUOLUMNE COUNTY.

The Sonora Banner says the Eagle Shawmut ledge in the workings is 160 feet wide. No waste is run out of the mine, abandoned workings being filled in. At the new hoist on the Eagle the pipe line delivers water at a pressure of 550 feet. At the new mill the pressure is 950 feet. The cost of running approximates \$30,000 per month, the wage account being \$17,000 for 250 men. A stone dam is contemplated to dredge the creek bed, deepening the channel and making it easy to sluice out the tallings. It is stated as a fact that ores are worked by this company at 75 cents per ton.

The Republican mine shaft will be sunk 600 feet and ten more stamps added to the mill.

The Hunter mine is bonded by San Francisco men from C. A. Holland for \$15,000, \$3000 payable in four months, \$6000 in nine, the remainder in twelve months. Ten miners will be put on. C. Sweeney has charge of operations.

The Hazel Dell mine on the Stanislaus river, 15 miles north of Carters, is working twenty men. Supt. Cope is sinking for the 300 foot and stopping out from the 200 level.

C. A. Smith has started up the Sunnyside mine. A roller mill will be put up immediately and a tramway 1700 feet long built from the top of the hill to the river.

The Sullivan mine near Soulsbyville is being reopened.

YUBA COUNTY.

A Marysville report is to the effect that the building of the four restraining barriers across Yuba river, near that city, is not the only undertaking which the California Debris Commission is looking after in that section. Statement is made that the Commission proposes to straighten the channel of the river between De Guerre Point and Marysville.

The Pennsylvania and Jefferson mines, Browns Valley, bond expires August 7th. An effort is being made to secure additional capital. About \$50,000 has been expended by the present company.

On the Yuba river, 10 miles above Marysville, prospecting is now being carried on by means of four Keystone drilling machines under the direction of W. P. Hammon. Seventy men are employed. Four improved dredgers, averaging in cost \$75,000 each, are taken of in connection with extensive dredging work in that vicinity.

COLORADO.

Colorado has appropriated \$50,000 for its State building at the St. Louis World's Fair and will raise \$250,000 more by municipal taxation. The assessment is for two-fifths of a mill upon every dollar's valuation in the State. The building will be constructed principally of yellow onyx and mottled marble. Every article embodied in its erection will be of local production, down to nails and glass. It will take an entire train to transport the materials and things which will be shown in the exhibition halls. The structure, approximately, will be 150x75 feet in dimensions, and two stories in height. Work will be commenced upon the assignment of the area. The State structure will be a colossal lounging place, superbly appointed and finished in onyx and marble. The mineral exhibits will consist of gold, silver, copper, lead and iron. Probably the most interesting exhibition planned by the commission is a miniature mine, to be operated. If the exposition company's consent can be secured, a 150-foot shaft will be sunk.

BOULDER COUNTY.

Wall Street reports the sale of the Black Cloud and Gold Hill group of mines to Boston men by B. F. Langridge for \$100,000. The group consists of seventeen mines and prospects, all passing to the Corona M. Co., organized under the laws of the State of Maine. The group has about 4000 feet of development work. A tunnel 700 feet long will be run to cut the Gold Hill property. A new mill will be put in.

Near Boulder Eastern stockholders in the Corona M. Co. have planned a large concentration and reduction mill to treat the low grade ores.—The Nancy G. M. & M. Co. at Wall Street is shipping regularly from the Gillard & Grey copper veins. The main tunnel is in 1600 feet.

CHAFFEE COUNTY.

At Turret the Anaconda mine, owned by the Bancroft M. Co., shows a vein of good ore in sinking. The new smelter will be running September 1. The Independence mine has begun the delivery of a 200-ton lot to the smelter.

CLEAR CREEK COUNTY.

The properties and interests of the Con. Stanley M. Co. and the Sallsbury M. & M. Co. are consolidated under the name of the Stanley Con. M. & M. Co. The new company controls 100 acres in the Idaho Springs district. The mines have 5 miles of underground workings.

At Yankee a rich strike has been made in the Lombard mine, belonging to the Yankee Con. M. & T. Co., in the second level of the mine, in the stope. The vein is 11 feet wide, of which 6 feet is smelting ore. The remainder is mill ore, worth about \$20 per ton. H. I. Seaman is general manager.

GILPIN COUNTY.

Russell and Lake districts are shipping large quantities and values, and great interest is shown in properties in that section. The Pittsburg group of mines, Lake district, are being operated by the Cashier G. M. & R. Co., under the management of B. L. Campbell. Seventy men are employed, the average monthly output of the mines is 750 tons of mill ore and 100 tons of smelting ore. The mill ore carries from two to ten ounces gold to the cord; the smelting ores have an average value of \$100 per ton.

GUNNISON COUNTY.

Gunnison reports that the East River G. M. & M. Co. will operate its property in the Gothic district extensively this season. The company owns six claims, on which has been done 1200 feet of development work. One tunnel is 500 feet in length. The vein, 3 feet in width, runs twenty-five ounces silver and \$5 gold.

Gunnison reports likelihood of the building of the Taylor Park railway, grading to begin next month. The proposed route will cover 50 miles, linking Buena Vista and Aspen. The Taylor Park Railway Co. is interesting in mining in that part of Gunnison county through the Taylor Park M. Co.

The Forest Hill Con. M. Co. has the main shaft down 400 feet. The company has a concentrating mill in operation 2 miles from the mine.

HINSDALE COUNTY.

Near Lake City, Supt. H. W. Brown of the Hanna G. M. Co. has the concentrating mill completed. The completion of the tramway is scheduled for Aug. 1.

LAKE COUNTY.

At Leadville, D. H. Moffat, owner Louisville mine, has sold it to E. A. Hanf and W. O. Reynolds, two local miners. Progress is being made at the Yak tunnel, 10 feet a day.

At Leadville, the A. M. W. is treating its slimes. A spur from the D. & R. G. runs to the mill, and along the tracks are mine ore bins, each with a capacity of seventy tons. Two sluice boxes carry

streams of water laden with zinc or lead concentrates. The water passes out of the bins through fine screens, and is caught in settling tanks. The material is loaded on the cars at the bins and it is not transferred until it reaches Galveston.

The Keystone M. Co. has secured sufficient money to pay off all its indebtedness and will resume operations.

At Leadville the Printer Boy M. Co. is locally reported to have opened up a vein of ore that will run \$500 to the ton.

The News-Dispatch reports a placer mining proposition on the Hayden ranch by men who have floated a steam dredger and steel rail track into the river bed of the Arkansas, cutting out a 2-foot road with a steam shovel, swinging it around and dumping it into a sluice box. The values are taken out by a set of rifles; the dredger will work in a 10-foot breast and on bedrock. This work, now in 2 feet of gravel, is paying expenses. The company has a large tract to work and is moving towards Leadville.

The Home Extension M. Co. will buy the Morocco M. Co. Manager Schlessenger, who it is understood will be the manager for the Home Extension M. Co., says that, if a market was open for the sale of manganese ore, the Morocco M. Co. could be put on a paying basis at once and begin shipping. As the market stands now, with no demand for manganese ore, he thought that \$30,000 would be sufficient to put the Home Extension on a paying basis by working through the Morocco shaft.

MINERAL COUNTY.

(Special Correspondence).—The Delmonte Leasing Co. here are operating the Delmonte, Last Chance and Volunteer mines on Bachelor mountain and are now shipping about seventy tons per day. J. W. Westlake is the superintendent, who also has charge of the New York mine, operated by the New York Leasing Co. The ore is mostly siliceous, averaging fifty ounces in silver. They expect to raise the tonnage to 100 tons per day next month. Considerable development work is being done on the New York, running three levels south towards the Commodore line. Mr. Westlake also has charge of the Big Kanawha Co., operating the old Happy Thought mine. They are sending sixty tons per day to the mill and expect in a short time to ship about thirty tons per day of their crude ores to the smelters at Pueblo. They employ about thirty-five men on the Big Kanawha and about fifty men on the balance of the properties.

The Amethyst M. Co. here are taking out 250 tons of \$18 to \$20 ore per month. They have been repairing their shaft the past six months, which accounts for the small tonnage. The Humphrey tunnel has cut through and connection made with the Amethyst, and it may be that the ore will be handled through the tunnel instead of by team as they have been doing since the burning of their tramway building in upper Creede about a month ago. Cyrus Miller is superintendent of the Amethyst.

The Ridge mine and mill at Creede have recently been leased by Mosher, Coulson, Carr & Eichbaum. They intend doing a great deal of development work on the mine, driving a raise of 150 feet.

They have the ore bin full of ore and are running the mill one shift. They expect to put on another shift in about a week.

The Ethel mill, J. A. Smith, Supt., is running steady one shift at present, but will run another shift in about ten days. They shipped 225 tons of concentrates last month. Zinc runs 60% and lead 75%. Creede, July 20.

PARK COUNTY.

The Queen City placer has been sold. It is 3 miles southwest of Fairplay on Four-Mile creek. The purchasers are Topeka, Kansas, men, who, after investigation, paid \$80,000 for it. The property consists of over 1000 acres, and as tested shows an average value of 50 cents per cubic yard. The owners say they will put on the best modern appliances for gravel washing and gold recovery. J. B. Adams, of Denver, is still in charge.

RIO GRANDE COUNTY.

(Special Correspondence).—B. F. Herr, Jasper, is putting up a large mill for the treatment of ores in that district. Mr. Oliver is also erecting a mill, and if these two mills prove successful there would be another one put up in the district, as they have a very large amount of low-grade ores and all they need is some kind of process to treat the ores successfully. The Oliver people have about fifty men doing development work on their property. The ore runs \$5 to \$6 per ton. It is understood Mr. Herr is putting in the Gage process for treating the ore. Jasper, July 19.

SAN JUAN COUNTY.

(Special Correspondence).—The Sioux

M. Co., E. C. Condit manager, is pushing work on the property. They were unfortunate last spring in losing their power plant by fire, but will soon be in working order again.

The Sunnyside mine, J. L. Terry manager, Eureka, is enlarging its mill from twenty to forty stamps, and will put in several concentrators. The mill is now daily handling seventy-five tons. The improvements are being made in Sunnyside mill No. 2. Development work is being pushed in the mine.

Eureka, July 17.

(Special Correspondence).—J. B. Warner, general manager Ledge M. & M. Co., Red Mountain, has the foundation completed for his 200-ton concentrating mill at Chattanooga, on Mineral creek, and work on the mill will be pushed as rapidly as possible. He is doing considerable development work on the mine and taking out ore running \$13 to the ton. The ore carries equal values in gold, silver and lead.

Red Mountain, July 17.

(Special Correspondence).—The Hercules Con. M. Co., operating on Sultan mountain, have bodies of ore. The lower tunnel, known as the Empire, is in 2400 feet; the Montezuma tunnel, 208 feet above the Empire, is now in 1800 feet; the Ricker or upper tunnel, 280 feet above the Montezuma, is in 800 feet. They are doing a great deal of development work, and are also operating the Little Dora mill, which was closed down last fall on account of scarcity of water. The mill is handling sixty tons per day. They have been running on the old dumps with the ore they are taking out of the mine. On account of the nature of the ore, they are able to get a very low treatment charge at the smelter. As soon as they can get enough ore blocked out, they will commence to operate the mill to its full capacity. H. V. Snow is secretary and acting manager.

The Silverton M. Co., J. C. O'Neill manager, Silverton, operating the North Star group on Sultan mountain, are making extensive improvements on their mill and power plant. They now have 120 H. P. water power, but are putting in a 300 H. P. steam plant. The engine and power house is to be 80x60 feet and the extension to the mill 75x40 feet. They expect to have the mill in operation by October 1st. They are doing a lot of development work in the different levels in the mine. The lower tunnel cuts the vein 700 feet deep. Their shaft is 110 feet below the level of Mineral creek. They expect to keep on sinking the shaft and opening up the different properties belonging to the company. Ore runs 3 ounces gold, 10 ounces silver, 10% copper. R. J. McCartney is Supt.

Silverton, July 18.

(Special Correspondence).—The Kendrick-Gelder Smelting Co., Silverton, have started up their smelter and handle 150 tons of ore per day. The majority of the ore comes from Red Mountain. They have made a number of improvements and are enabled to handle the ore through the furnaces much faster than heretofore. Manager F. C. Kendrick states they have 5000 tons on hand and getting all the ore they can handle.

The Henrietta mine, owned and operated by the Kendrick-Gelder Co., Silverton, is doing mostly development work at present. They have the lower tunnel in 1400 feet and expect to cut the main ore shoot at 1600 feet at a depth of 400 feet below the lowest workings.

The Esmeralda mine in Minnie gulch, Silverton, R. W. Hollis manager, is shipping sixty tons of ore per week which averages about \$60 to the ton.

The Gold King Con. M. Co., at Gladstone, is operating their 80-stamp mill night and day, handling 200 tons every twenty-four hours. About 160 men are employed by the mine and mill. The ore will average about \$10 per ton, about 25% free milling ore. They have cut the lead at 500 feet below the deepest workings and have the same general character of ore as above, but of a higher grade apparently. Total depth 1100 feet. It is rumored that the Gold King has made a rich strike and uncovered a large body of high-grade ore, but was unable to get Manager W. Z. Kinney to confirm the report.

The Royal M. & I. Co., Silverton, working the King mine on Sultan mountain, have their lower tunnel in 600 feet and expect to cut the vein in 300 feet more at a depth of 800 feet. At a depth of 248 feet they have the vein in the third level. They will build a 1500-foot tramway from the railroad to the upper terminal. Ore is a gray copper and lead, carrying gold, silver and lead. Eastern stockholders have been here the past week and are well pleased with the work being done by Manager M. H. Kinney and Supt. W. R. Pyke.

The Contention M. Co., operating the North Star group on King Solomon mountain, are taking out 100 tons per day.

Ninety-five men are employed. This mine probably has the distinction of being at the highest elevation of any mine in the country, the main hoarding house being a trifle over 13,000 feet above sea level. The tramway from the mill to the mine is 11,000 feet long.

Silverton, July 20.

At Silverton the 200-ton smelter of the Kendrick-Gelder Co. was blown in last week. Thirty men are working at the mine and twenty at the smelter.

SAN MIGUEL COUNTY.

Telluride reports the closing of the Peck cyanide plant, the result of the sale of the ground over which the tailings run from the mines in Savage and Marshall basins, to the mining company operating above the plant. The Peck Co. will go to Mexico.

Another statement regarding this matter from Telluride is that the Peck cyanide plant has been bought by the Tom Boy, Smuggler-Union and Liberty Bell; that these companies have bought the surrounding land as a common dumping ground on which to store their tailings; and that the mines will now treat them on company accounts.

The Big Six group of mines, adjoining the Tom Boy group, has been bonded and leased to M. C. Fulton of Ouray for \$25,000.

At Telluride the Double Eagle M. Co., recently incorporated, will develop and operate mines in Bridal Veil basin. The ore is tellurium and strictly a gold proposition, except the Black Diamond, which carries silver values. The character of this ore is petzite. Samples sent to the smelters for tests gave returns of \$70 per ton gold.

SUMMIT COUNTY.

At Robinson the smelter has closed down for thirty days to extend the smoke-stack.

TELLER COUNTY.

The Keystone M. & M. Co. is considering the sale of the Victoria and Nancy Hanks claims to Eastern parties for \$25,000. The claims comprise 3.18 acres on Bull hill. They have never produced anything and are undeveloped.

The Big Twenty G. M. Co., owning 125 acres on Grouse mountain, have begun a tunnel which when completed will be a mile long.

Cripple Creek reports that the lessees on the Anaconda number forty; sixteen of them are shipping 800 tons a month that averages \$15 per ton. The company receives 25% straight royalties.

The mining inspector has ordered work suspended on the Metallic tunnel, being driven into Rhyolite mountain. There are buildings at the mouth of the tunnel, and, should they catch fire, there might be a parallel case to that of the Smuggler-Union at Telluride, though as the Metallic has no connection with other workings such contingency is unlikely.

In six months the Portland will install the largest compressor in the State with power sufficient to drive forty-five machine drills. The foundation will be a solid wall, 9 feet deep, 20 feet wide, 45 feet long. Foundations are also being made for five hoilers, each 250 H. P.

Final payment of \$200,000 has been made on the Granite mine, Victor, by Tutt, Penrose & MacNeill, officers of the United States Reduction Co. The property consists of the Granite and the Baby Mine claims, ten acres on Battle mountain. The present daily output from the mine is forty-five tons.

Manager A. May of the Last Stake M. & L. Co., operating the Last Stake claim of the American Con. Co., Victor, will let a contract to sink the present shaft to a depth of 1000 feet. It will cost about \$20,000.

The Pharmacist Con. M. Co. has decided that in the future no work will be done on company account. The Pharmacist claim on Bull hill is all being worked by lessees. Some of the lessees are in good ore and are shipping.

IDAHO.

ADA COUNTY.

J. M. Ingalls, manager Ingalls property, Charlotte gulch, will erect a 100-ton Bryan mill on his property.

Work is resumed on the Twin Sisters group of quartz claims in the Boise Basin country. Supt. Ingalls has charge of the work. It is understood that the Trade Dollar Co. is furnishing the funds to carry on the development. There is a shaft down 300 feet and a 10-stamp mill.

BOISE COUNTY.

Manager Hodson of the Lincoln mine, at Pearl, is making tests to determine the kind of machinery needed. The Checkmate, at Pearl, has a stamp mill in operation. The Lincoln Co.'s ore is of a character that a Chilean mill might be of better service. As soon as it is determined whether the rolls or stamps will be used, Manager Hodson will place an order for a large mill.

CUSTER COUNTY.

The White Knob copper mine at Mackay, which closed down unexpectedly a short time ago, throwing several hundred men out of employment, will resume operations next week. General Manager Boyd says that the death of John W. Mackay, the principal owner of the mine, would in no way interfere with the intention to resume work on a large scale. A picture of this property, the last mining property with which the late John W. Mackay was associated, will appear in next week's issue.

ELMORE COUNTY.

Near Mountain Home J. Carty, one of the owners of the Bonaparte mine, says the property is a producer and he will begin working it September 1.

IDAHO COUNTY.

Jno. McMahon of San Francisco declares that he has found cinnabar at Thunder Mountain, 12 miles southwest of the Dewey mine, and tells of finding "gold that ran from 20% to 40% quicksilver," a natural amalgam, as it were. So far nothing in the way of precious metal remains undiscovered in that region as reported locally.

The litigation involving title to the Buffalo Hump group of mines has been settled out of court. Three years ago the Buffalo Hump M. Co. bought the group, the price being announced at \$750,000. Later the claims were jumped. The Buffalo Hump Co. now obtains full title to the group.

ONEIDA COUNTY.

Supt. G. M. Corns of the United Mines Co., Rock creek, near Malad; has the inclined shaft 85 feet in ore averaging \$20 per ton.

OWYHEE COUNTY.

Silver City reports considerable activity, new locations are being made on War Eagle, the rich vein at the Poorman is even better than at first reported, the Sinkertunnel ledge is widening in rich ore and other properties are being operated at a profit.

SHOSHONE COUNTY.

Operations may be resumed by the Frisco Con. M. Co., near Gem. When the mine closed down last year it was shipping 1800 tons a month and employing 300 men.

Following is the assessment of the producing mines of the county for 1901 and 1902, and the increased assessment this year over last:

	1901.	1902.	Increase.
Bunker Hill & Sullivan...	\$156,542	\$658,680	\$502,138
Cœur d'Alene Dev. Co.	6,500	108,150	101,650
Cœur d'Alene M. Co.	19,200	66,200	47,000
Empire State-Idaho M. & M. Co.	181,785	1,168,340	986,555
Helena-Frisco Con.	134,975	615,090	480,115
Golden Chest M. Co.	17,650	111,425	93,725
Gold Hunter M. Co.	23,250	223,000	190,750
Hercules		50,808	
Hecla M. Co.	20,605	313,260	292,655
Morning Mine (Larson & Greenough)	170,020	669,370	499,350
Mammoth M. Co.	50,000	551,200	501,200
Standard M. Co.	116,480	608,350	491,870

Total increase of mining assessments on the mines given over assessment of 1901, including the Hercules, \$4,136,008.

At the Snowstorm, near Mullan, the new tunnel is in 75 feet and shows dry sulphide copper.

At Burke the Hercules will run a new tunnel to cut its ore body 500 feet deeper than the present workings. It will be 2300 feet in length. An air compressor will be put in.

MISSOURI.

JASPER COUNTY.

Joplin reports the output of zinc for the week ended July 12 as amounting to 9,606,420 pounds, valued at \$162,437, and lead 1,352,190 pounds, valued at \$32,453. The output for the last twenty-eight weeks was: Zinc, 291,813,680 pounds, valued at \$4,205,184; lead, 34,252,200 pounds, valued at \$742,912.

MONTANA.

FERGUS COUNTY.

C. T. Durrell, manager Central Montana M. Co., will work the low-grade ore of the Spotted Horse and Whisky Gulch mines.

Fire destroyed the Spotted Horse stamp mill near Maiden last week. The mill was built by Holter & Hauser in 1890 and cost \$100,000. It was not in operation.

FLATHEAD COUNTY.

The Snowshoe mine, in the silver-lead

district southwest of Libby, has resumed operations. Two carloads of concentrates are shipped from Libby each week. Eighty men are employed. As soon as the mine is opened up to the 500-foot level new machinery will be put in and the force increased. On this same belt other mines are being opened up that will become producers. In all about 500 men are working in and about Libby. One can see that it is a place of considerable promise.

GRANITE COUNTY.

King & Murray will begin work on the Antelope mine, near Phillipsburg.

Snyder & Huffman, South Boulder, have a 14-inch streak of free-milling ore that goes nearly \$100 to the ton, and propose building a mill.

J. Schneider projects putting machinery on the Dorothy mine, at Boulder.

A gold nugget weighing \$75 was recently found on Willow creek. It contains some quartz. It was found in the tailings and had evidently been thrown out of a sluice box along with the boulders.

JEFFERSON COUNTY.

The Elkhorn mine will employ 150 men and is adding to its force as fast as miners can be secured.

LEWIS AND CLARKE COUNTY.

In the East Helena smelting plant one of the blast furnaces has been blown and the calcining furnaces have been in use a week. The entire plant will be in operation this week. It is locally understood that E. B. Braden will have charge and that C. W. Whitley, who has been in charge, will take the chief position in the Salt Lake City works.

An express carload of cyanide product worth over \$30,000 has been shipped from the Drumlummon cyanide plant at Marysville to an Eastern refinery. The cyanide plant of the Drumlummon has a capacity of 400 tons of tailings per day. The plant is on Silver creek, 16 miles from Helena. It is treating the tailings from the Drumlummon mine, the accumulation of the long milling operations of the company and fill the bed of Silver creek for 5 or 6 miles below the 110-stamp mill belonging to the company at Marysville.

A method of precipitating gold and base metals in the cyanide solution without the use of zinc is employed at the Empire mine, a modification of the Pelatan-Clercl, a further modification of the Siemens-Halske process. The process consists in passing a current of electricity through the cyanide solution containing the gold and other metals and depositing the precious metals upon a series of cathode plates suspended in the solution. It permits the use of a very attenuated solution of cyanide as low as one-tenth of a pound of cyanide to a ton of water being used. The copper, gold and silver in the solution are deposited upon metallic cathode plates in a concentrated form. The product comes off the plates in the form of a combination of gold, silver and copper about the thickness of tinfoil. The hullion product is then refined at the plant.

MADISON COUNTY.

Work has been resumed on the Garnet mine, near Pony.

It will cost nearly \$25,000 to put the new stamp mill in Red Bluff in shape for treating ore. The mill is complete, but the machinery not yet in place.

The Montana & St. Paul M. Co.'s office is at Twin Bridges. The property is on Wisconsin creek, 6 miles from Sheridan.

T. C. McGrath has sold the Boss Tweed Extension and Jeanette mines to L. Lienmann for \$30,000 in cash; the Boss Tweed Extension part of it adjoins the Boss Tweed and Clipper ground in Jeanette, 4 miles from Pony.

The Barnes-King mill, North Moccasin, is to be increased to double the present capacity.

Near Virginia City, dredge No. 2 of the Conroy M. Co. has begun operations.

S. G. Crandall of Tacoma has a lease and bond on the placer ground of the Eagle Hill M. Co. at Summit.

At the Easton mine thirty men are employed in development work on the Easton and Pacific. The second-class ore is treated at the mill, the first reserved for shipment to the smelter.

MISSOULA COUNTY.

A. P. Johnston, on Trout creek, near Cedar creek, will do considerable work there this season.

NEVADA.

DOUGLAS COUNTY.

F. Everett of the Poco Tiempo mine at Alkali lake, reports a mill erected on the property. The ore concentrates freely and reduces from ten tons to one; the concentrates assay 900 ounces silver, \$37.50 gold and 47% lead.

ESMERALDA COUNTY.

Lida, an old mining camp in southern Esmeralda, is reported as "taking a new lease of life."

A gold ledge is reported found 20 miles

from Sodaville, in the direction of Tonopah.

EUREKA COUNTY.

Ore shipments by rail from the mines of Eureka district for the week ending July 19 were as follows: Eureka Con., 36,360 pounds; Diamond, 103,520; Excelsior, 34,240; Richmond, 31,400. From Hamilton: Rocco-Homestake, 53,790.

HUMBOLDT COUNTY.

A 6-inch streak of ore in the Sheha mine, near Unionville, is said to show values of 180 ounces silver and \$10 per ton in gold.

LINCOLN COUNTY.

The Searchlight mine is using electric drills; the mill will be in operation Sept. 1.

The sale of the April Fool Co.'s group of mines and mill at De Lamar to Bamherger's De Lamar Mines Co. for \$200,000, was authorized at a meeting of stockholders in Salt Lake last week.

LYON COUNTY.

F. Leonard, Jr., in the interest of the Gold Canyon T. E. Co., for the extension of the south lateral branch of the Suro tunnel to drain the Silver City mines, is sanguine that arrangements will be concluded for beginning the work of extension.

NYE COUNTY.

J. L. Butler has charge of the affairs of the Tonopah G. C. M. Co., a claim located in early days and afterwards patented by him.

Clyde Jackson is superintendent the Tonopah & Great Western M. Co. with seven claims on about 100 acres adjoining the California. A two-compartment shaft will be sunk.

C. D. Van Duzer writes from Philadelphia, Pa., that he has formed a mining company, composed of Pennsylvania capitalists, to operate Tonopah mines.

Tonopah reports another strike in the Fraction mine. The town is lively; C. & C. trains are crowded with passengers.

STOREY COUNTY.

At a depth of 825 feet drill hole No. 1 in Potosi ground on the Brunswick lode is abandoned; a second hole will be started about 10 feet from No. 1.

WASHOE COUNTY.

A rich strike is reported from the Talylho mine, 1800 feet north of the Wedekind, at a depth of 350 feet, the lead, 4 feet wide, averaging \$150; values are largely in gold.

WHITE PINE COUNTY.

At Ely in the Chairman, the latest strike on the 200 level shows a body of ore assays from which give values of \$200.

OREGON.

BAKER COUNTY.

Ten stamps are in operation at the Golconda mill, Sumpter; C. J. Carlson is mill Supt.

Chief Surveyor West of the Sumpter Valley Road says that there will be no extension of the road for several years.

There are twenty-four mills and cyanide plants in present operation in the Sumpter district.

The Big Producer group of mines, comprising eleven claims in the Alamo district, are sold to W. R. Eisenhower of Spokane, Wash., for \$15,000 cash. The new owner intends to push development. A new hoist, capable of sinking a shaft 1500 feet, will be put in.

Sumpter reports at the Quebec mine the 10-stamp mill started up for the summer and ore in sight to keep running for six months. The Don Juan mine has been unwatered and the shaft started down with three shifts. Drifts are being run on the vein every 100 feet. The mill will be started next month.

JOSEPHINE COUNTY.

The Mountain View Copper Co. has incorporated at Kirby, W. J. McNamara, W. E. Olmstead, J. L. Lowell.

Ramsey & Ingram, two miners of Grant's Pass, say they have discovered a nickel ledge, Butcherknife creek, western Josephine county, with a width of 100 feet and exposed for 200 feet up either wall of Butcherknife creek, at the point where that stream cuts through it. Serpentine is the predominating formation.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Columbus Con. G. M. & M. Co., organized by H. J. Mayham of Denver, N. T. Mason and A. Baldwin of Deadwood, has property embracing nearly all of the townsite of Central City.

The Hidden Fortune Co., in its main working tunnel on Deadwood gulch, has driven it 1800 feet along the strike of the gold ledges of the Belt mines.

The Spearfish G. M. Co. have a gold brick weighing 834 ounces, sold to the Denver mint for \$15,025.30, from the property at Ragged Top. The mill will handle about 6000 tons a month. It costs \$1.86 a ton to mine, treat and ship ore. The ore averages between \$4 and \$7 a ton.

UTAH.

BEAVER COUNTY.

The Blue Acre M. Co. has incorporated, H. M. Crowther, Salt Lake, president; M. H. Wait, Kansas City, Mo., secretary. The company owns 636 acres near Milford. Manager Crowther is sinking in copper ore.

Near Beaver, Brooks & Ferris, owners Lone Cabin group, on North Creek, have started work on a tunnel 1000 feet long, to cut the vein at a depth of 1500 feet. The surface is gashed with veins, and some gold ore has been found.

JUAB COUNTY.

The Mammoth mill is dropping fifty-five stamps on an average of 135 tons of ore daily.

SALT LAKE COUNTY.

R. W. Rodgers, Supt. Dalton & Lark group at Bingham, has the main tunnel driven 3400 feet from its portal; work is progressing in both directions from the headings at the bottom of the shaft.

TOOELE COUNTY.

Supt. G. Z. Edwards of the Con. Mercur furnishes figures concerning the recent free gold strike that indicate extraordinary strength, justifying the belief of some engineers concerning it, of an added value of \$2,000,000.

WASHINGTON.

FERRY COUNTY.

At Wauconda the mill is idle, but the manager states that it will soon be running again.

Supt. Crummer of the San Poil has men at work stoping ore in that property.

WHATCOM COUNTY.

Sumas reports that Supt. Wm. Martin of the Gold Run M. & M. Co. is developing the company's property on Red Mountain, in the Mount Baker district. G. Pierce, of the Pierce G. M. Co., says the tunnel is driven along the lode 120 feet.

WYOMING.

Sixty of an order for 400 new side-dump ore cars have been received at Cheyenne by the Colorado & Southern and placed in service in the ore traffic between the Sunrise iron mines and the smelter of the Colorado Fuel & Iron Co. at Pueblo, Colo. The average daily tonnage from the Sunrise mines is to be increased from thirty to sixty tons.

FOREIGN.

BRITISH COLUMBIA.

The Trall refinery reports that the new process of refining by means of electricity is a success. The daily ten-ton refined product turned out by the plant is .999 pure; in 1000 pounds of lead turned out there is but one pound of material other than pure lead.

During the week ending the 19th Rossland mines produced 6730 tons of ore, as follows: Le Roi, 5100 tons; Le Roi No. 2, 1500 tons; Giant, 130 tons. The total for the year to date is 179,376 tons.

The Granby mines, at Phoenix, have resumed work; the output of the district is below the ordinary standard. Recently 2330 tons were sent to the various smelters, making a total for the year of 259,854 tons. The Rossland mines shipped 7000 tons during the same period, making the year's total to date 172,646 tons.

MEXICO.

SONORA.

Phelps, Dodge & Co. of New York now control the Indiana-Sonora mining properties at La Cananea, adjoining those of the Greene Con. M. Co., and form a wedge in the Greene mines. S. A. Provot, formerly of the Copper Queen smelters, will be the Supt.

The Cananea Railroad has been sold to the Nacabo Pacific. The road runs from Nacabo to Cananea, 45 miles.

SOUTH AFRICA.

U. S. Consular Agent W. D. Gordan, of Johannesburg, says he has been asked to secure information in regard to automatic scales, or automatic registering devices, which can be attached to scales used in weighing ore.

Obituary.

JOHN W. MACKAY.

John W. Mackay, a typical miner, and the last survivor of the famous four, Mackay, Fair, Flood & O'Brien, died in London on the 20th inst., in the seventy-first year of his age. Mackay was born in Dublin, Ireland, came to California in 1851, mined in Downville, Sierra county, Cal., learned a little and knew that little well, kept on learning mining, went to Virginia City, Nev., started a tunnel, failed, got a job at \$4 a day timbering in the Mexican mine there, mined a little on his own account at Gold Hill, and about 1863 began to get a good idea of conditions and

requirements in that vicinity. He started in on what was afterward known as the Comstock, but, his money giving out, he got Flood & O'Brien, two San Francisco men, to go in with him. Subsequently J. G. Fair became a "partner." Mackay was the miner, and worked resolutely, the others supplying the money, disregarding scoffs and rebuffs, saying, "I know it's there, and I am going to get it." At one time he had spent \$450,000 of the firm's money, with nothing to show for it but considerable development work. Finally the "bonanza" was struck, in 1873, Mackay working right along as mine superintendent, while he and Fair took out \$150,000,000 gold and silver from one mine alone.

This is but the barest, baldest recital of years of privation and dazzling success, but, whether packing his dinner bucket or handling millions, Mackay was always the same—generous, charitable, and ready to recognize anyone and everyone.

When he left the Comstock he was among the world's richest men. He invested largely in San Francisco, then in New York, and then plunged into financial enterprises that attracted world-wide attention. He laid two cables from the United States to England and France, and was just arranging for a cable from the United States to the Philippines when death called him.

He never hoarded money; he gave away millions, made many men's lives glad, and was creative of conditions. He was probably the best known miner in the country and in his day was the most dazzling and successful. There was no "luck" about Mackay's career. He had nerve, knowledge and sticktoitiveness, and won out. His death awakens a multitude of reminiscences of the old days, and a hundred columns could be written of his career without exhausting the subject.

Commercial Paragraphs.

JONES & LAUGHLIN of Pittsburg, Pa., are continually making additions to their electrical equipment, and have just recently ordered from the Westinghouse Electric & Manufacturing Co. one 800 K.W. direct connected generator, two 150 K.W., motor-driven, two-phase alternators, and two 125-light, motor-driven arc generators.

The Ironside Co., Columbus, Ohio, report a substantial increase of business during its last fiscal year, recently ended, with encouraging prospects for continued growth in the current year. Its manufactures comprise special lubricants for ropes, gears and machinery, not only to protect against wear, but also to resist the corrosive action common to mining operations.

The C. O. Bartlett & Snow Co. of Cleveland, Ohio, are putting in a drier for drying coal for the McCormick Harvesting Machine Co., Chicago, Ill., their object being to first dry, then grind the coal into dust and use it in this form in their annealing ovens. They are also furnishing one of their large driers for the Indianapolis Water Co., Indianapolis, Ind., for the same purpose, to be used in the water works boilers in place of natural gas. There is quite a saving in this process.

POPULAR MECHANICS of the 10th inst. has an illustrated article descriptive of an aerial tramway built by A. Leschen & Sons Rope Co., St. Louis, Mo., in 1900 for the American Gold Mining Co. at Ouray, Colo. The line is 4200 feet long. The loaded buckets run on an 1½-inch rope, the empties returning on a 1-inch rope, the buckets being propelled by a ½-inch endless steel wire rope, which passes around one 8-foot sheave at both the terminals of the line. Each bucket has a capacity of 6½ cubic feet. The St. Louis firm is now building a tramway of the same gravity type at Encampment, Wyo., to be 16 miles long, the longest tramway of the kind in the country.

A. TAIT, assistant manager George Angus & Co., Ltd., Newcastle-on-Tyne, England, one of the largest leather belting manufacturers of the United Kingdom, is spending two weeks in Syracuse, N. Y., having come to this country especially to visit the works of the New Process Raw Hide Co. An arrangement was made with Messrs. Angus & Co. by T. W. Meacham, president of the local company, during his recent visit abroad, whereby the English concern is to establish a plant in England for the manufacture of rawhide gears and other products under the patents and processes of the local company and using the latter company's trademark. This plant, it is expected, will take care of the company's business not only in Great Britain, but throughout Europe. Upon Mr. Tait's return to England, he will place orders with American firms for the latest gear-making machinery. Messrs. Angus & Co. have been the agents of the New Process Raw Hide Co. for Great Britain for eight years.

Personal.

PERCY GARDNER is Supt. Delaware mine, Carson, Nev.

FRANK ROBBINS of British Columbia is in San Francisco, Cal.

DUNOAN FALCONER is Supt. Tenabo M. Co. at Cortez, Nev.

J. P. REUTER is Supt. Mt. Goram M. & M. Co., Dutton, Colo.

J. C. SHERMAN is manager the Placer M. Co., Pactola, South Dakota.

G. A. WANDER is manager Cerbat Mining & Reduction Co., Cerbat, Ariz.

JAMES D. HAGUE, president North Star M. Co., is visiting Grass Valley, Cal.

GEORGE H. ROBINSON has returned to Salt Lake City, Utah, from London.

U. B. CURTIS and T. L. ODDIE of Tonopah, Nev., are in San Francisco.

CHARLES MOYER, president Western Federation of Miners, is at Fernie, B. C.

R. B. TURNER is now superintendent Kearsarge mine, Virginia City, Montana.

A. J. McDONNELL has been re-elected Supt. Union Con. M. Co., Virginia, Nev.

WM. TYACK succeeds Robert Ousby as foreman Kennedy mine, Amador county, Cal.

WM. M. MILLER now has charge of the Chase mine, Russell Gulch, Gilpin county, Colo.

J. M. SHALLER is the new manager Burns-Moore M. & T. Co., Idaho Springs, Colo.

E. F. ROBERTS has been elected manager Deer Lick M. Co., Spearfish, South Dakota.

W. B. KEHOE of Spokane, Wash., is examining Shasta county, Cal., mining properties.

B. ROSS succeeds W. M. Tanner as manager Bertha mine and mill, Idaho Springs, Colo.

JOSEPH DIXON takes charge next week of the Antelope mine, 11 miles from Phillipsburg, Mont.

WM. WEBBER of Sacramento, Cal., has gone to superintend his mining interests in South Africa.

MANAGER ROCKWELL has returned from Chicago to the Minnie Moore mine, Bellevue, Idaho.

C. PLATONOW, representing Baku, Russia, oil interests, is examining the oil fields of California.

E. M. DE DA VERGNE has been elected general manager the Elkton Con. Co., Cripple Creek, Colo.

A. R. GIBSON, president Gibson Dev. Co. and American Con. Copper Co., is visiting Clifton, Ariz.

R. E. PALMER, formerly chief engineer Le Roi, B. C., mine, is now assistant Supt. Rio Tinto mine, Spain.

JNO. MOORE of West Point, Cal., late foreman at Treadwell mine, Alaska, goes to South Africa next month.

GEORGE DERN, manager Con. Mercur mines and mills at Mercur, Utah, has returned there from New Jersey.

S. A. PROVOT will be the Supt. of the newly acquired Indiana-Sonora properties at La Cananea, Sonora, Mexico.

A. DE WET, who has been operating the diamond drill in mining camps in Peru, has gone to New York City.

J. T. SIMMONDS, long time shift boss Bunker Hill mine, Wardner, Idaho, has gone to Johannesburg, South Africa.

CHARLES WIER has been elected general manager Yellow Aster M. & M. Co., Randburg, Cal. E. H. Barton continues as Supt.

LEWIS T. WRIGHT, general manager Mountain Copper Co., Keswick, Cal., goes to Europe next month for a two months' sojourn.

P. J. NEVINS has resigned the management of the French Gulch M. Co., Breckenridge, Colo., and is succeeded by J. C. Whisler.

C. W. AMENT, president Golden Drift M. Co., says he will bring a trainload of people from Chicago to Grant's Pass, Or., next month.

A. H. BROOKS of U. S. Geological Survey in Alaska, expects to go as far as the Tanana river, thence to Circle City and Forty Mile district.

P. P. SWINDLER, formerly superintendent De Lamar, Nevada, mines, is in charge of the Searchlight property, Searchlight, Nevada.

F. N. NEWELL, W. W. WEED, W. LINDOREN and R. N. CHAPMAN of the U. S. Geological Survey will attend the Mining Congress at Butte, Mont.

W. L. BELL, for some years Supt. Candelaria M. Co., Juarez, Mexico, has been appointed manager of a copper company in New South Wales, Australasia.

G. A. YAEGER is general manager and M. M. Pender Supt. Chicago & Colorado

M. & D. Co., operating the M. M. mine, Ute creek, near Georgetown, Colo.

F. S. MASSON is general manager Arizona Construction Co., which proposes to build an electrical power plant 50 miles from Prescott for the Arizona Power Co.

L. CRONIN, Supt. Camp Bird mine, Ouray, Colo., who tendered his resignation, to take effect August 1, was killed on the 24th by falling 120 feet through a manhole in the mine.

F. A. JONES, the retiring director of the New Mexico School of Mines, has gone from Socorro to Albuquerque and has taken position as field assistant with the U. S. Geological Survey.

R. D. HUNTER, Denver, Colo., manager Sullivan Machinery Co., has gone to South Africa, to be absent till January 1, 1903. In the interim the Denver office will be in charge of W. P. J. Dinsmoor.

C. F. URQUHART, of the U. S. Geological Survey, is in Baker City, Or., to extend the system of triangulation to be utilized in making a topographical map of the country north and east of that city.

J. D. YOUNG, a Chicago mining engineer and chemist, has been examining and reporting upon copper properties in Vernon county, Wis. J. Eddy, representing Prof. Young, has been examining bituminous coal mines near Cornell, Ill., for Chicago men.

A. J. McMILLAN, the new director of the Le Roi Co., Rossland, B. C., says that Manager John H. McKenzie has tendered his resignation, but that he has consented to remain in office until his successor is appointed. No information is given out as to the identity of the new manager, though B. nard McDonald is locally mentioned.

PROFS. R. A. S. REDMAYNE AND T. TURNER, who hold respectively the chairs of mining and metallurgy in the University of Birmingham, are at present in America, investigating our technological schools with a view to the arrangement of their departments in Birmingham. Prof. Redmayne is quoted as saying: "In no part of England, nor anywhere on the continent, in fact, can you find a school of mining or a department of metallurgy in any university that can in any way compare with those to be found in Canadian and American universities."

F. KLEPETKO has resigned as general manager Boston & Montana mines, Butte, Mont., and smelters in Anaconda and Great Falls, Mont. Next month he goes to New York to take the position of consulting engineer of the Corra de Pasco mines, Peru, South America. He will make New York his home. The mine to which he goes is said to be the largest single deposit of copper in the world and is being developed by J. B. Haggin of New York and his associates. These mines, famous as silver producers for 250 years, were worked by the Incas before that. Later investigations show great copper deposits; \$3,000,000 is said to have been expended by the present company in securing four-fifths of the mineral region. The mines are 80 miles from Oroya. A railway is to be built to cost \$2,000,000, connecting them with the Oroya Railway, terminating at the port of Callao. This road will be standard gauge and cross a ridge of the Andes at an elevation of 14,000 feet. With the exception of two short lengths of 3%, the average grade will be 1½%.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

STEAM GENERATOR.—No. 704,743. July 15, 1902. J. L. Gironx, Jerome, Ariz. This invention is especially designed for the employment of a fuel which can be continuously supplied and removed when exhausted. Also it is intended to use the slag from smelting furnaces and the like, though other forms of fuel may be employed in conjunction with a generator of this description. It consists of an annular, tubular and horizontally revolvable shell, a continuous firebox or furnace in the form of an open channel with one side, and the means for continuously supplying the fuel at one point, and means for removing it when the heat is exhausted.

OIL AND AIR MIXING AND GAS GENERATING APPARATUS.—No. 704,732. July 15, 1902. J. Behm, San Francisco, Cal. This invention relates to an apparatus for burning petroleum oil. It consists in mechanism for separating and introducing compressed air and the oil and for comminuting the oil and intermingling or mixing it with the air and heating the mixture and jets through which it is discharged, with means for delivering it to the point where combustion is to take place.

CENTRIFUGAL PUMP RUNNER.—No. 704,756. July 15, 1902. F. Ray, San Francisco, Cal., one-half assigned to James Spiers of same place. This invention relates to improvements in centrifugal pump runners of the class known as "closed" type. It consists in the combination in a centrifugal pump of a casing with suction in a centrifugal pump of a closed runner revolvable within said casing, said runner consisting of radial

vanee of less peripheral diameter than the interior of the casing, and disks fixed in parallel planes upon each side of the vane, said disks having a diameter equal to the interior diameter of the casing less clearance.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING JULY 15, 1902.

704,496.—CIRCUIT BREAKER—B. Ballentine, Sumpster, Or.
704,672.—VELOCIPED—H. Berry, S. F.
704,581.—ELECTRIC LAMP—H. W. Beecher, Port Townsend, Wash.
704,732.—GAS GENERATOR—J. Bebm, S. F.
704,773.—TANK HOOP LUG—A. J. Behrens, S. F.
704,735.—ALARM CLOCK—W. C. Bethel, Seattle, Wash.
704,371.—FLUME GATE—E. Campbell, Redlands, Cal.
704,616.—MOTOR VEHICLE—H. Charles, Kofa, Ariz.
704,532.—CURTAIN SUPPORT—J. Gale, S. F.
704,743.—STEAM GENERATOR—J. L. Giroux, Jerome, Ariz.
704,923.—DRAPER—W. T. Gordon, Juniper, Or.
704,972.—BOTTLE COVER—F. T. Griffin, Los Angeles, Cal.
704,539.—TANK—E. N. Harmon, Belvedere, Cal.
704,978.—SHIP'S BERTH—A. W. Hitt, S. F.
704,746.—LOCK FOR SIDEWALK DOORS—P. H. Jackson, S. F.
704,977.—GAS GENERATOR—F. L. Kinoid, Stockton, Cal.
704,551.—PARCEL CARRIER—Lambert & Joy, Portland, Or.
704,557.—CHECK VALVE—W. R. Michener, Oakland, Cal.
704,901.—BICYCLE—F. C. Moore, San Bernardino, Cal.
704,660.—BAKE OVEN—J. Nestor, Tacoma, Wash.
704,910.—RAT TRAP—F. Olafsen, Tacoma, Wash.
704,687.—GAS GENERATOR—P. B. Perkins, Los Angeles, Cal.
704,756.—PUMP RUNNER—F. Ray, S. F.
704,588.—STEAM BOILER—J. P. Simmons, S. F.
704,666.—CAMERA SUPPORT—J. R. Stephens, Portland, Or.
704,768.—FREEZER AND CHURN—S. Sweeney, S. F.
704,697.—SCREEN HANGER—A. L. Taber, Corona, Cal.
704,717.—FUEL—B. M. Thomas, S. F.
704,723.—BELT CARRIER—J. Weichhart, S. F.

Latest Market Reports.

SAN FRANCISCO, July 25, 1902.

METALS.

SILVER.—Per oz., Troy: London, 24½d (standard ounce, 925 fine); New York, bar silver, 52½c, refined (1000 fine); San Francisco, 53c; Mexican dollars, 43½c; San Francisco, 41½c New York.

COPPER.—New York: Standard, \$11.35@11.50; Lake, 1 to 3 casks, \$11.75; carload lots, \$11.50; Electrolytic, 1 to 3 casks, \$11.75; carload lots, \$11.50; Casting, 1 to 3 casks, \$11.65; carload lots, \$11.50. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: 253 13s 9d spot, per ton.

LEAD.—New York, 4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco, \$4.50; carload lots, 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £11 5s per ton.

SPELTER.—New York, \$5.37½; St. Louis, \$4.50; London, £19 5s per ton; San Francisco, ton lots, 5½c; 100-lb lots, 6½c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$28.25; San Francisco, ton lots, 31c; 1000 lbs., 31c; 500 lbs., 31½c; 200 lbs., 32c; less, 32½c; bar tin, 3½c, 37½c. London, £128 spot.

PLATINUM.—San Francisco, crude, \$18.25 ½ oz.; New York, \$19.00 per Troy oz.

QUICKSILVER.—New York, \$48.00 large lots; London, £8 16s; San Francisco, local, \$46.50 ½ flask of 76½ lbs.; Denver, \$50.00. Export, \$44.50.

BABBITT METAL.—San Francisco, No. 1, 10½c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER.—Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100-lb. lots, 16½c.

NICKEL.—New York, 55@60c ½ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.00; gray forge, \$21.00; San Francisco, bar, 3c ½ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$33 and \$34; open hearth billets, \$35.00; San Francisco, bar, 7c to 12c per lb.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2*, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ½ set; 14 oz., 40s., 9c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$11; Welsh Anthracite, \$13.00; Rock Springs, \$9.00, long ton; Colorado Anthracite, \$14.00. Coke, \$13 per ton in bulk, \$15 in sacks; Sunnyside, \$11.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 27@28c ½ lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 66c ½ B, 3c ½ lb.; soda ash, \$2.00 ½ lb.; hyposulphite of soda, 2½@3c ½ lb.; blue vitriol, 5½@6½c ½ lb.; borax, concentrated, 7@8c ½ lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, 2.00@2.25; flour sulphur, French, 2½@2¾c; California refined, 1½@2c; nitric acid, in carboys, 8c ½ lb.; caustic soda, in drums, 3@4c ½ lb.; Cal. s. soda, bbis., \$1.25 @1.50 ½ lb. 100 lbs.; sks, \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins.

ASSAY LITHARGE.—Per lb., 8½c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c ½ lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, ½ lb., 60c.

MERCURY.—Bichloride, ½ lb., 90c.

MOLYBDENUM.—25c ½ gramme; 1000 grammes—2½ lbs.

PHOSPHORUS.—(American) ½ lb., 80c.

SILVER.—Chloride, ½ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ½ lb., \$1.00.

URANIUM.—Oxide, ½ lb., \$3.50.

ZINC.—Metallic, chemically pure, ½ lb., 50c.

ZINC.—Dust, ½ lb., 10c.

ZINC.—Sulphate, ½ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Montana State School of Mines.

The State School of Mines, located at Butte, Montana, in the midst of the greatest mining camp in the world, offers unrivalled opportunities for practical work and observation. Its third year will open September 9th. Examinations for admission or advanced standing, September 8th. For catalogue or other information, address

N. R. LEONARD, PRESIDENT.

MICHIGAN COLLEGE OF MINES.

An Engineering School with unique location, giving it unusual facilities. New Mining Engineering and Hydraulic Building, also Chemical and Metallurgical Building ready for fall term 1902. For catalogue giving list of graduates and their occupations, address

F. W. MCNAIE, Pres't, Houghton, Mich.

SITUATIONS WANTED.

Position wanted by Assayer and Surveyor at present employed in Arizona. Will go any place. Few years' experience East and West, and a good technical education. Address A. B. C., care of Mining and Scientific Press.

WANTED.—Position as Assayer and Bookkeeper in a mine; experienced in underground work; good references; present position not desirable. Address Box No. 137, care of this office.

WANTED.—Position by a technical graduate. Am an experienced stamp and cyanide millman, good assayer and chemist. U. S. deputy mineral surveyor. Can handle any kind of a mill or mine. Address Technical, care of this office.

ASSAYER, familiar with cyanide practice, desires position as assayer, or if some capacity, in cyanide plant. Address X, care of Mining and Scientific Press.

PRACTICAL MILLMAN.—AMALGAMATOR, Cyanide Man and Assayer, wishes position. School of Mines graduate. Best references. Address R. B., care of Mining and Scientific Press.

Cyanide and Stamp Mill Superintendent open for engagement after September 1st. Graduate. A thorough assayer and chemist; also accountant. Speaks Spanish. Will go anywhere. Specialty, construction; also successful treatment of low-grade and slimy ores. References "A." Address Practical, care of Mining and Scientific Press.

MINE FOREMAN.—Young man (33) with 14 years' experience as a practical miner in Montana, Idaho, Black Hills, Arizona and California, energetic and possessed of fair technical knowledge, desires position with some progressive company. Fully conversant with standard air drills and familiar with all systems of timbering. Would like position where progressive methods applied to economical extraction would be appreciated. Foreign countries not objected to. First-class references as to ability and general reputation. Address C. M. A., care Mining and Scientific Press.

A technically educated Mining Engineer, at present employed as superintendent of mines for one of the largest corporations in Mexico, desires a change of position to the United States about July 1st. Has had 18 years' successful experience as engineer and superintendent, never having made a failure; 36 years of age; strictly temperate; a skilled designer, geologist and metallurgist, and a practical miner, as well as a hard worker and thorough business man. Reference of the highest order, including present employers. Address Supt., care this office.

EXAMINATION OR SUPERVISION

of Mines, Smelters and Mills.

Mining Engineer and Metallurgist, of unquestionable reputation and long experience, now permanently residing at Seattle, Wash., will examine or take general supervision of mines, smelters or mills, in Pacific Coast States, British Columbia or Alaska, as consulting engineer, for reliable parties. Is also reliable accountant to examine. Box 813, Seattle.

WANTED.

A YOUNG MECHANIC WITH SEVERAL EXCELLENT PATENTABLE IDEAS would like assistance of capitalist or manufacturer. No airships, just plain every-day necessities. Address J. H., care of this office.

WANTED.—A party thoroughly posted in mining who can sell mining stock in a reliable company developing its property in Idaho. References required. Address Hoosier Mining Company, Marion, Indiana.

WANTED.—BY TWO ENERGETIC AND EXPERIENCED MINING MEN the acquaintance of persons interested in the development of mining property in old Mexico. Address D. L. C., care of this office.

Wanted to Bond a Dry Placer Claim, One Rich in Flour Gold.

Must be a dry proposition. Address "Placer Claim," care this office.

MINERS' AND PROSPECTORS' GUIDE.

REVISED THIRD EDITION.

By James Irving & Co., Gold Refiners and Assayers, 128 N. Main St., Los Angeles, Cal.

Contains U. S. State and Territorial Mining Laws, as well as much useful information for miners and millmen.

Our New and Revised Catalogue of Practical and Scientific Books, 92 pages, 8vo.; a Catalogue of Books on Chemistry, Mining, Prospecting, Mineralogy, Geology, Metallurgy, etc.; a Catalogue of Books on Steam and the Steam Engine, Machinery, etc.; a Catalogue of Books on Sanitary Science, Gas Fitting, Plumbing, etc., and our other Catalogues and Circulars, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

ASSESSMENT NOTICES.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of July, 1902, an assessment (No. 30) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 415 Front street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of September, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHAS. BOVONE, Secretary.
Office—415 Front street, San Francisco, California.

MAYDAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of July, 1902, an assessment (No. 6) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 405 of the clause Spruells Building, Cor. Third and Market Sts., San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 15th day of September, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
EDWARD H. STERN, Secretary.
Office of the Company—Heald's Business College, 24 Post St., San Francisco, California.

WILLIETTA MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Jacksonville, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of June, 1902, an assessment (No. 4) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 233 Crocker Building, corner of Post and Market streets, San Francisco, California. Any stock upon which this assessment shall remain unpaid on Monday, the 4th day of August, 1902, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 2d day of September, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
E. MCALLISTER, Secretary.
Office—Room 233 Crocker Building, corner of Post and Market streets, San Francisco, California.

DELINQUENT SALE NOTICE.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Placerville, El Dorado County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 13) levied on the 13th day of June, 1902, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Am't.
Mrs. Harriet O. Huntington.....	223	1,500	\$30.00
Mr. J. O. Huntington.....	223	1,500	20.00
F. A. Robins.....	378	500	10.00

And in accordance with law, and an order from the Board of Directors, made on the 13th day of June, 1902, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at 112 Main street, San Francisco, California, on MONDAY, the 11th day of August, 1902, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expense of sale.

N. F. REMINGTON, Secretary.

Office—112 Main street, San Francisco, California.

DELINQUENT SALE NOTICE.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 10) levied on the 2nd day of June, 1902, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Am't.
H. Barth.....	225	250	\$12.50

And in accordance with law, and an order from the Board of Directors, made on the 2nd day of June, 1902, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 773 Mission street, San Francisco, California, on MONDAY, the 18th day of August, 1902, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expense of sale.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from Fred. G. Low Jr., in the Lone Star Mine at Cromberg, Plumas County, Cal., to deposit tailings in Jackson Ravine, draining into Jackson Creek; from E. H. Wemple and A. M. Davis, in the Clippiship Mine, near St. Louis, Sierra County, Cal., to deposit tailings in Cedar Grove Ravine, draining into Slate Creek; from Cataract Gold Mining & Power Co., in the Indian Bar Placer Mine, near Spanish Ranch, Plumas County, Cal., to deposit tailings in basin draining into North Fork of Feather River; and from Geo. W. Fox, in the Doherty Mine, at Hartsburg, Plumas County, Cal., to deposit tailings in Slate Creek, gives notice that a meeting will be held in room 96 Flood Building, San Francisco, Cal., on August 4, 1902, at 1:30 P. M.

Caswell Bros.' Cabin—Ranch on Big Creek: Lou, Caswell Sitting on Extreme Left.

Mule Creek Cabin and Post Office, Roosevelt, Thunder Mt., Idaho: Site of Proposed 100-Stamp Mill.

Thunder Mountain City, at Mouth West Fork Monumental Creek, 8 Miles From Dewey Mine.

The Dewey Mill and Mine, Boarding House, Etc., Thunder Mountain, Idaho.

The Dewey Lead Near Apex, Thunder Mountain, Idaho.

Scenes In and Around Thunder Mountain, Idaho.

SO MUCH has appeared herein regarding Thunder Mountain—special articles, correspondence, etc.—that little remains unsaid. The pictures on this page are from photographs taken by Mr. W. B. Kehoe of Spokane, Wash., a practical miner, who thoroughly prospected that entire region. They show just how the country looked last month, and are given prominence because they are believed to be the first of the kind that have appeared anywhere.

The opinion of the MINING AND SCIENTIFIC PRESS on the subject is well understood. There is undoubtedly good prospecting ground, but so far the public has been worked more than the ground. More than usual effort has been made to create a boom, to start a rush, and there is the usual number of disappointed men. Half the effort and expense put in better localities nearer home would have produced better results—for the men who do the mining.

Meanwhile that whole region is well mineralized and is almost ideal for summer prospecting. There will be a scattering out and some good ground will be located and, subsequently, developed. So far the Caswell Bros., who sold their discovery to Col. Dewey of Pittsburg for \$100,000, have made the best "strike." They are good prospectors and also understand how to enlist the attention of newspaper reporters on the lookout for something sensational.

EDITORIAL—Regarding Thunder Mountain, Idaho, 56. Absorption of Joplin, Mo., Zinc and Lead Properties; A Poor Economy; Declining Rate of Interest; Work of National Bureau of Standards; The Century of the Engineer; Production of Copper; Starting Theories About Gold Production, 57.

MINING SUMMARY—64-65-66.

LATEST MARKET REPORTS—68

MISCELLANEOUS—Concentrates, 58. Mineral Products of California for 1901; Canadian Mining Institute; Publications Received, 59. The Patio Process for Amalgamation of Silver Ores, 60. Extraction of Gold by Chlorination; The Absorbent Roller, 61. Hints to Prospectors; Resumption at Mackay, Idaho; Copper in Northern California, 62. Mining and Metallurgical Patents; Electric Blindness, 63. Personal; Commercial Paragraphs; Obituary; New Patents; Notices of Recent Patents, 67-68.

The latest merger is the absorption of the combined Joplin, Mo., zinc and lead properties by a company composed of some officers of the American Smelting & Refining Co. The latter corporation, as a corporation, does not appear in the transaction, having little to do in its general business with Missouri ores. The natural effect will manifestly be, however, that the new company may be looked upon as an adjunct or auxiliary of the American Smelting & Refining Co.

It is poor economy to keep in use a machine which requires frequent repairs. Better throw it out first than last and get one that will save money and hence make money. It is equally poor economy to do work with an old-fashioned machine when the work thus done costs more than it would on a newer improved machine, even if the new device costs considerably more money. Suppose the new machine or device or plant does cost \$5000 more. If it saves \$5 a day or makes \$5 a day the investment is a good one. Five dollars a day is easy \$1500 a year. Deducting \$250 for interest leaves a net gain of \$1250 annually, or 25% on the investment, and 25% is always good business. Nor is there anything made by keeping in machinery "that isn't worn out." It is better to work a machine for all that is in it, crowd it, wear it out, and then throw it away if there is anything in that line new and better that can be had, for the new improved machine will usually make more money for its owner than the old one possibly could.

This is the century of the engineer, for the rule of thumb is giving way to the rule of three, and in this the engineer, the man of applied science, leads. Inventiveness, ingenuity, the scientific spirit, exemplify the work to be done by the mining engineer, the metallurgical engineer, the chemical engineer, the electrical engineer, and the wide domain of the civil engineer. This is to be largely a matter of practical education, of technical training, the specialist, who has learned what to do and how to do it and yet expects to die learning, being ever ready to seize and use specialized knowledge. In this industrial battlefield, whose conflicts are constant and colossal, the engineer is to be a most prominent figure. In this regard it is to be noted that the technical school is of prime importance. We speak of the "technical school," not of the "college of engineering" or "college of chemistry," etc., tacked on as a sort of "side line" by sundry universities. The technical school is essential to the embryo engineer; later, shop practice and practical experience will give value to his laboratory

instruction. The chief difference between the technical education spoken of and the usual "college education" is that the latter is general, the former special, and this is the age of the specialist.

The work of the national bureau of standards has begun at Washington, D. C. The Government has appropriated \$250,000 for a laboratory; a \$60,000 power plant is to be placed. This is the initial of a work of prime importance to mining, metallurgy, electricity, chemistry, engineering work and applied science in general. The bureau has a tremendous amount of work to do and of a kind that involves skilled effort and patient experiment and research. Its first efforts will be to establish legal standards for all scientific measurements; then provide place for keeping legal standards of weights and measures, arrange means for correct comparison, and certificate as to accuracy of commercial appliances submitted for test. Years must necessarily elapse before much tangible result will appear, but a beginning has been made. The plan deserves the hearty co-operation and support of mining men everywhere, for it will be of ultimate economic value to all their allied interests.

The steadily declining rate of interest is having its reciprocal effect on mining investments. Twenty years ago 15% was not an uncommon rate of interest; ten years ago 10% and 12% was paid. The rate has dropped to 6, 5, 4; in savings banks 3, and it is predicted by financiers that 2%, and even 1%, will eventually be the ruling rate. Men with money turn from the present proffered 4% to the more lucrative inducements for revenue offered by judicious mine investment. In this connection, though in a different line of thought, it is to be noted that this dropping of interest rates levels things up (or down) in accordance with the theories of some socialistic reformers. It curtails the "leisure classes," and compels more men to work. Time was when the man possessed of \$50,000 could secure an annual safe return of \$5000 therefrom. Time will be when none but the millionaire can keep from active employment of some kind, as nothing less than the possession of a million will keep its owner from the necessity of having to work for a living.

MANAGER GREENE of the Greene Con. Co., just across the line in Mexico, south of Bisbee, Arizona, is locally credited with claiming ability to produce copper for 1½ cents per pound. It is not at all likely, however, that the manager of that or any other copper mining concern would make any such preposterous claim, though in the case of the Greene Co. the cost of producing copper is unusually low, not so much because of any extraordinary richness of ore or superior economic facilities for handling or treatment, but because the company has a virtual monopoly, and everything in the place pays tribute, so that if the number of pounds of copper handled be divided into the company's receipts the quotient would in that way appear to be an abnormally low cost figure of production. Just what it really does cost to produce a pound of copper is an interesting question. Much depends on locality and conditions. That word "conditions" would take every line of space available to duly explain. In the (geologically) old mines of the Lake region the market selling price has regulated the cost of production. When copper was "up," the lowest grade ores were worked, in some instances the copper costing 15 cents per pound. When copper was "down," the lean ore reserves were untouched and the higher grade ores mined. Thus, for instance, the Calumet & Hecla can produce copper at 4 cents per pound, or at 10 cents, actual cost, as circumstances arise. So with the Atlantic mine, which has been able to extract profit from ore yielding only six-tenths of 1%, or twelve pounds of copper to the ton. At the mines of the Mountain Co., in California, at Rossland, B. C., the United Verde, Arizona, the Bingham, Utah, and, in general, on the Pacific coast, entirely opposite conditions exist. Different arrangements for smelting, freights, charges, etc., difference in the ores themselves, which are young (geologically), and a variety of other causes, make cost charges figure on a different basis. The same applies to Montana. In that State costs run from 7 to 15 cents per pound. The by-products,

which may include gold and silver contents, cut considerable figure. In Utah, the Utah Consolidated has been credited with producing copper at 4 cents per pound; the United Verde, Arizona, has been similar subject of numerous statements setting 3 cents as the cost there of producing one pound of copper. At the Old Dominion M. Co., Globe, Ariz., Supt. F. W. Hoar says that for the calendar year 1901 the cost of production was 12½ cents, and that for the three months ending June 30, 1902, the cost was 10½ cents, laid down in New York. It is manifestly impossible to state just what it costs to produce a pound of copper, unless it be definitely understood what it is that the word "cost" means. So many factors may be made to enter into the problem, or so few, according to local conditions, as to preclude possibility of accuracy in any general figure.

PROF. N. S. SHALER, the geologist of Harvard University, who promulgated some startling theories about gold production some time ago, has been looking around some more, and now announces that gold is widely diffused through both the water and land of the earth and that the chief difficulty consists in getting it out. This is a proposition that does not admit of successful contradiction, even though it lack the merit of originality. The melancholy fact was learned long ago. Still the Professor admits that a great many men have overcome the difficulty, that the gold production of the world is increasing, and he thereupon figures that the first thing we know there will be "an increase in the price of anything for which money is paid," which means that gold will partly lose its present purchasing power. Prof. Shaler further argues that, as this rise in prices will increase the cost of mining gold, it will "tend to lessen the profits of such operations," and "at some point in the movement a balance would be attained which would check the further increment of the supply," or, in plain English, he thinks that if we keep on increasing the annual gold output, everything will get so dear after a while that it won't pay to mine gold any more, and that there will then be a decrease in the world's annual gold output. But the Professor, in writing this way, forgets or ignores the fact that even if there were such a general rise in prices, all other forms of mining would have to cease before gold mining itself could be affected—a condition that 20th century progress makes manifestly impossible, gold being the standard of values, monetary and otherwise. The break in Prof. Shaler's argument is lack of recognition of the one prime fact that the more gold the more money, of the value that gold alone can bestow, and that, unless gold is "demonetized" and some higher standard of monetary value created, present conditions will continue. There is, however, another phase of the whole subject that has more than an academic interest. The increased output of gold is not the direct result of gold mining per se. Nowadays there is a general tendency to having gold production lower the price of nearly all other metals mined in connection therewith. As silver some years ago began to be a by-product of lead mining in many instances, so in gold mining there is now incidental production of lead, copper and silver—that is, where the ore itself would not pay to have the gold alone extracted, other metals are now produced in the process of mining gold, and that, too, in increasing quantities, to the effect of depressing the price—under the immutable laws of supply and demand—of all metals so produced, excepting gold alone, which, being unaffected by competition, maintain its standard price. There is still another idea in connection with this, that further tends to upset Prof. Shaler's arguments and deductions. He overlooks the general progress. The great development of the world, the tremendous business activity and the consequent monetary requirements will more than offset any probable increase in gold supply. South American and South African developments, the opening up of the Orient, the inevitable change of countries now dominated by paper money to the gold standard, are among the solid answers that negative the professor's argument. The manner in which great production of gold is distributed indicates how little attention gold miners anywhere need pay to these constantly recurring articles concerning a possible gold glut.

Concentrates.

MAGNET WIRE is copper wire covered with a winding of cotton or silk thread.

MUSTARD GOLD is theoretically recognized as indication of telluride at greater depth.

ANTIMONY, finely powdered, if sifted into perfectly dry chlorine gas, will combine very rapidly with it.

THE floating debt of a corporation usually is the concern's unsecured liabilities, current unpaid accounts, etc.

ONE DOLLAR is the legal fee in Arizona for recording mineral location certificates or affidavits of annual assessment work.

TIN has been repeatedly discovered in Arizona, and the recent reports are more repetitions of former statements more or less authentic.

COAL at \$3.85 per ton is about equivalent to oil at 2½ cents per gallon. At \$2 per ton coal is 37% cheaper than oil; at \$4.85 per ton it is 20% dearer as a fuel than oil.

THE first International Mining Congress of the present series was held at Denver, Colo., July 7, 1897. The current convention will be held at Butte, Montana, next September.

WHERE working fine ore in a large size furnace "clogs things" there are but two things to do, use a smaller furnace or briquette the fine ores. The latter is feasible and uniformly satisfactory.

It is not common to ship waste as it comes from the shaft or drifts where dumpage ground is not to be had; such procedure is always costly. Where necessary a dump must be cribbed to keep it from encroaching on neighboring ground.

CHLORIDE OF MAGNESIUM in 600-pound barrels is worth 1½ cent per pound, and chloride of manganese in same shape 4 cents per pound in New York City. The two are quite dissimilar. Either in smaller quantity at the point required would cost considerably more.

THE Tomboy mine, at Telluride, Colo., is nearly 12,000 feet above the sea. The ore in that vicinity occurs in andesitic breccia, overlying Tertiary conglomerate, among the most recent rocks formed, the fact being fatal to the theory that gold is found only in the "older" rocks.

THE first elevator bucket gold dredger operated in that country was the F. L. Graves, at Bannack, Mont., in 1895. The Dieselhorst Bros., near Redding, Cal., operated a rude form of gold dredger in 1894; the first scientifically constructed gold dredger operated in California was in 1896.

CYANIDE SOLUTION is powerless in the presence of antimony. One-tenth of 1% of that metal taken up by the solution makes it worthless. Sulphuret of zinc is almost as bad. Copper carbonate in the ore makes necessary the use of sixty pounds solution to each per cent of such copper in the ore.

THERE is no legal requirement that stakes or monuments shall be maintained upon mining claims after they have been set properly, but convenience makes it manifest that such maintenance be made. It is, however, an offense against the law to pull up or remove location stakes once rightly placed by others.

NEITHER hypsulphite of soda nor calcium hypsulphite are solvents of metallic gold. Cyanide of potassium, chlorine and bromine are the three solvents of greatest commercial success, though there are several others that give laboratory results, as sodium sulphide, iodine, salt and niter, chloride of sulphur, etc.

ORDINARILY, in pyritic smelting the charge would consist of a mixture in the following proportions: Pyrites, 15%; quartz ores, 45% (containing lime and pyrites); lime ores, 20%; low-grade matte, 10%; slag, 5%; coke, 5% to 3%; and from 1% to 2% charcoal, the charge of fuel added being about 5% of the total.

THE blow struck by an air drill is usually figured at seventy-five pounds. The actual weight of the blow is not really known. The weight of the blow struck by a hammerman is greater than that struck by a power drill. The blow struck by a blow is inversely proportional to the number of blows he strikes per minute. The faster the blow the less the weight.

THERE is nothing phenomenal about the trisecting of a right angle. The radius of a circle is equal to the chord of 60°. If the radius be laid off as a chord from one extremity of the arc of a quadrant, or the arc subtending a right angle and a radius be drawn to the other extremity of the chord, the angle formed on one side will be 60°, and on the other side the angle will be 30° or one-third of a right angle.

WHILE no dictionary gives authority to use the word "inquartate," yet the prescriptive right of genius will justify an assayer in using that term to express the idea it conveys. In such cases where a suitable word is not found in the dictionary the American way is to coin a suitable word, and after some years of general use it will find its way into the dictionaries and become a permanent part of "the language."

A CUBIC YARD of gneiss will weigh, approximately, 4540 pounds. A rubble wall, carefully laid with full mortar beds and joints, will require about 0.3 cubic yard of mortar, which, if composed of one part natural cement and two parts sand, will weigh, approximately, 940 pounds. In a yard of rubble in which there is 0.3 yard

of mortar there is 0.7 yard stone; one cubic yard rubble will weigh 4118 pounds, or 152 pounds per cubic foot.

ACCORDING to laws of hydraulics determined from experiments and observations a cutoff raises the surface of the river at the foot of the cut nearly as much as it depresses it at the head. The country above the cut is relieved only at the expense of the country below. If a series of cutoffs be made, the height of the floods will be regularly decreased from a point midway in the series to the upper end, and regularly increased from the same point to the lower end.

A SIMPLE condensing engine is one having a single cylinder. The steam, after performing a certain amount of work in the cylinder, is exhausted into a condenser, where it is condensed and a vacuum formed. A non-condensing engine of any style or type is one in which the steam, after passing through the cylinder, or cylinders, as the case may be, is allowed to escape into the atmosphere, or into the heating pipes if the exhaust steam is used for heating.

THE term "unit," used in connection with tin ore, as with all other similar use, is equivalent to per centum; thus tin ore assaying 70% and never at \$2.92 per unit is worth the assay value multiplied by 2.92. One ton of ore assaying 72% would be worth therefore $72 \times 2.92 = \$210.24$ per ton. Ore assaying anything below 70% loses 3.04 cents value per unit, 68% being worth \$2.858 per unit; 60%, \$2.615; 50%, \$2.31; 40%, \$2.007; one ton of ore assaying 30% would be worth \$67.688.

MINING MEN visiting Chicago are invited to have their mail addressed to our Chicago office, 737 Monadnock Block, where they will also see what is considered one of the finest mineral museums in the country. Visitors to Colorado are also proffered the courtesies of our Denver office, 606 Mack Block, especially fitted up for the convenience of mining men. San Francisco visitors are likewise cordially invited to use similar facilities afforded by the office at 330 Market St.

AS APPLIED to measurement of electric light, the term "candle power" is obsolete and unmeaning. The standard candle is supposed to consume so many grains of its substance in an hour, but the light that it emits varies according to the plane in which it is looked at, and the condition of the wick and the atmosphere in which it is burning, and whether or not it is affected by drafts, until, upon the whole, the candle is an utterly unreliable measure of luminous intensity.

A GOOD aluminum solder is: Block tin, twenty-eight parts by weight; phosphor tin (10% phosphorus), fourteen parts; lead, three and one-half parts, and seven parts of spelter. Dirt and grease should be carefully cleaned from the surface with benzine, the solder being applied with a copper. When the molten solder covers the surface of the metal, it should be scratched through with a wire brush, by which the oxide is broken and taken up, a quick manipulation being necessary.

DYNAMITE CARTRIDGES are ordinarily 8 inches long, and are either ¾ inch, 1 inch, 1½ inch, 1¾ inch, 1½ inch, 2 inches, 3 inches or 4 inches diameter. To calculate the weight of the charge in a dynamite cartridge multiply the square of the diameter of a cartridge by its length— $\frac{1}{2}$ of the product is the weight of the cartridge in ounces. Thus the weights of the above sizes would be, respectively: 3.8 ounces, 5 ounces, 7.8 ounces, 11.3 ounces, 15.3 ounces, 1 pound 4 ounces, 2 pounds 13 ounces and 5 pounds.

IN the use of caustic soda for the prevention of scale and corrosion in boilers, the precipitation may be carried out in the boiler, only one small tank being required in which to mix the soda with the feed water. The proportion per 1000 gallons is 1½ ounce of pure caustic soda for each grain of lime per gallon; a water containing ten grains of bicarbonate per gallon would thus require fifteen ounces of caustic soda for each 1000 gallons. Carbonate of lime is soluble in 82,500 parts of pure water at freezing point.

It is not easy to state exactly "what was the biggest mass of pure gold ever found?" If the word "pure" were taken out of our inquirer's question, probably a correct answer would be citing the chunk of gold free from quartz that was taken from the Byer & Haltman claim, Hill End, N. S. W., May 10, 1872, weighing 640 pounds and worth \$148,000, which would make it about 930 fine. It was imbedded in blue slate 250 feet from the surface. It was 57 inches long, 33 inches wide, and averaged 4 inches in thickness.

A SLOW but certain way of assaying cyanide solution is to first filter two liters of the solution to which sufficient oxalic acid is added to slightly acidify it. This filtrate is evaporated in a porcelain dish and when thus drawn to a low bulk is transferred to a leaden dish with an excess of litharge and a reducing agent, or about 10 c.c. of lead acetate solution. When evaporated add borax, carbonate of soda, litharge and reducing agent (mixed together before such addition) and the ashes from the burned filter, the whole to be melted in a small pot, the resulting button to be scorified if too large for the cupel, the required silver for parting to be added to the button. This determines the gold values only.

IN the southwest of Spain are the largest open-cut copper mines in the world—the Rin Tinto, Tharsis, Penia and Calanas. Labor is so cheap there that mechanical appliances, other than railways and trucks, are not necessary and are not used. One of the mines handles nearly 2,000,000 tons of ore annually. The ore, after

the copper has been extracted, and occasionally before, is exported in great quantities to England, Germany, France and the United States, because it contains about 50% sulphur, which is used for the manufacture of sulphuric acid for the general chemical trade. On account of the peculiarities of the ore, the copper can be extracted by simple means. The ore is merely placed out in huge heaps (terros), when the copper sulphides contained in it decompose and become soluble. They are then washed out with water and precipitated into long canals by means of pig iron and scrap, thus producing metallic copper.

CONCERNING a "Concentrate" in the issue of Nov. 30, 1901, regarding the antiquity of assaying and the finding of cupels in ancient Roman relics, a Capetown, South Africa, reader writes that "Zimbabwe, in Mashonaland, Central South Africa, has ruins which show an almost modern acquaintance with the arts. Hinting at even prehistoric times evidence of abundant supplies of gold are reported—and later abundant gold in Arabia and gold in Phoenicia and Tyre was well known. Recent discoveries point to Zimbabwe, South Africa, as the place of its origin. Iron smelting furnaces are unearthed, a crude blow pipe was found and also the remains of a bellows; and discovered among other relics was unearthed an ingot mold with patterns of Phoenician gold ornaments showing they worked for the Phoenician market. Crucibles were found there and specimens brought away. The excavators found that the gold was crushed and separated by a water process, then put in clay crucibles well closed up and left for a long time in the furnace."

USUALLY the term pay shoot is a relative one, depending not only upon the presence of ore in the vein, but also upon economic conditions for mining and milling at the mine in question. Although the vein throughout the entire extent of a claim may be more or less mineralized, the pay ore will almost always be found limited to certain zones called pay shoots. The length of the pay shoot is determined by the distance a body of ore of certain magnitude, character and value continues, or nearly so, along a level driven longitudinally on the vein, the length varying, as shown in the various levels driven from end to end of such body. Should the pay shoot be proved to extend down into the fissure or whatever other the character of the ore deposit to a depth of 3000 feet, more or less, and should it be one continuous, unbroken shoot from the apex to the greatest depth attained upon it, even though its marginal lines should average only 100 feet apart, more or less, it might be argued that the true length of the shoot would be the verticality, and the true width the distance between the boundary lines indicated in the levels; and yet the length and width are not so determined. Occurring thus, it would describe an irregular oblong form, following a prescribed dip and trend, and the width would be invariably known as the length and the thickness as the width, while the length would be referred to as the vertical depth. Yet this is confusing, as it would appear from one standpoint with such form of shoot that it would be just as reasonable to call the apparent width of an ordinary house chimney the length, and the thickness the width, and to refer to the length from base to top only as the height; and there are probably people who calculate the height of a chimney as the length of the chimney. Miners sometimes call ore shoots in mines chimneys, but they refer to the length of the chimney as it is indicated in the levels.

RENEWING cylinder head packing in a gas or gasoline engine is something that should be done at least once a year under favorable conditions, but new packing may be required much more frequently unless the work is done carefully and receives attention at once when needed. The gasket usually is of such form as to include both the water jacket and cylinder head packing in one piece. The first occasion for removing the cylinder head of a gas engine should be used in making an accurate template of sheet metal by which gaskets can be cut. A template of this kind is easily made and will save much time, making also a better gasket than can be cut directly from the face of the joint. These gaskets may be made of straw board soaked in linseed oil, asbestos sheet, or one of the combination packings consisting of asbestos and rubber, with wire cloth insertion. The last is probably the best for joints somewhat roughened by rust or other cause. Any of the above materials should be thin, so as to bring the metal faces as close together as possible when the head is drawn up. These gaskets should be cut on a smooth board with a sharp chisel, and must be handled very carefully while being put in place. Asbestos sheet will make a better joint if well dampened after being put in place, as it then presses more closely into the small irregularities of the metal. Before putting on a new packing it were well to remove all traces of the old gasket and smooth the metal with emery cloth to free it from rust and any roughness in the surfaces to be joined. While the cylinder head is removed and the cooling water space accessible it should be thoroughly cleansed of all mud and scale deposited by water. With an engine provided with a separate water jacket this is not a difficult matter, as the jacket can be removed and the hard scale scraped from the cylinder. With some waters practically nothing but mud is deposited, in which case a stream of water directed into the jacket will usually clear it very thoroughly. However, if the deposit is a hard, cement-like substance, it must be scraped from the metal to which it adheres like the scale in a steam boiler.

Mineral Products of California for 1901.

State Mineralogist L. E. Aubury reports the yield and value of the mineral substances of California for 1901 as follows, as per returns received at the State Mining Bureau, San Francisco, in answer to inquiries sent to producers:

	Quantity.	Value.
Antimony.....	50 tons	\$ 8,350
Asbestos.....	110 tons	4,400
Asphalt.....	21,364 tons	312,219
Bituminous rock.....	24,052 tons	66,354
Borax (crude and refined).....	22,221 tons	982,380
Cement.....	71,800 tons	159,842
Chrome.....	130 tons	1,950
Brick.....	130,766 M	860,488
Pottery.....	55,679 tons	39,144
Coal.....	150,724 tons	401,772
Copper.....	34,931,785 lbs	5,501,782
Fullers earth.....	1,000 tons	19,500
Glass sand.....	4,500 tons	15,750
Gold.....	821,923 ozs (fine)	16,989,044
Granite.....	214,943 cu. ft.	519,285
Graphite.....	64 tons	4,480
Gypsum.....	3,875 tons	38,750
Lead.....	720,500 lbs	28,820
Lithia mica.....	1,100 tons	27,500
Lime.....	317,383 bbls	334,688
Limestone.....	76,937 tons	99,445
Macadam.....	360,883 tons	313,974
Manganese.....	425 tons	4,405
Magnesite.....	4,726 tons	43,057
Marble.....	2,945 cu. ft.	4,630
Mineral paint.....	325 tons	875
Mineral water.....	1,555,328 gals	559,057
Natural gas.....		92,034
Paving blocks.....	1,920 M	41,075
Petroleum.....	7,710,315 bbls	2,961,102
Platinum.....	250 ozs	3,200
Pyrites.....	4,578 tons	18,429
Quartz crystals.....	4,000 lbs	17,500
Quartz sand.....	500 tons	500
Quicksilver.....	26,720 flasks	1,285,014
Rubble.....	169,513 tons	327,063
Salt.....	126,218 tons	366,376
Sandstone.....	226,741 cu. ft.	192,132
Serpentine.....	89 cu. ft.	890
Soda.....	8,000 tons	400,000
Silver.....		1,229,356
Slate.....	5,100 squares	38,250
Soapstone.....	10 tons	119
Tourmaline.....	500 lbs	20,000
Turquoise.....	500 lbs	20,000

Total.....\$34,355,981

In the previous year the total product was valued at \$32,622,945; increase for 1901, \$1,733,036.

The total value of metallic substances for 1901 was \$25,052,796, an increase of \$1,694,066. This includes gold, silver, mineral paint, quicksilver, antimony, copper, lead, manganese, platinum and chrome. Silver is given in coining value. The Bureau has never independently collected statistics of precious metal output, but has used totals and distribution by county, as obtained at the U. S. Mint, San Francisco, where they have the advantages of verification by figures of receipts at U. S. Mint and assay offices, and private refineries and smelters throughout the United States.

The total value of non-metallic substances was \$2,923,201, an increase of \$746,044. This includes borax, coal, mineral waters, salt, asbestos, gypsum, magnesite, pyrites, lithia-mica, fullers earth, quartz crystals, soda, tourmaline and turquoise.

The total value of hydrocarbons and gases was \$3,432,709, a decrease of \$1,080,242, including asphalt, bituminous rock, natural gas and petroleum. The gas is given in value of that commercially utilized. The petroleum price is the average per barrel f. o. b. at the wells or stations in each county. The decrease is due to low prices for oil prevailing last year. The product was much larger, but prices much lower than previous year.

The total value of structural materials was \$2,947,275, an increase of \$373,202. This includes brick and pottery clays, hydraulic cement, lime and limestone, macadam, rubble, and concrete rock, paving blocks, marble, granite, sandstone, serpentine, slate, quartz sand and glass sand.

The relative value of the principal mineral products of the State is as follows: 1st, gold; 2nd, copper; 3d, petroleum; 4th, quicksilver; 5th, silver; 6th, borax.

The relative rank of the counties of the State, in point of mineral production, is given in the following table. In each case the value given includes that of all the mineral substances combined produced in the respective counties for the year. Some counties produce, in addition to gold and silver, five, six or seven other substances, while other counties which produce little or no gold or silver, produce in large quantities quicksilver, mineral oils, copper, lead, asphalt, structural materials, etc. The figures include aggregate value of all mineral products, including precious metals. These latter are based, as stated, upon U. S. Mint returns for the year. The term "unapportioned" includes total value of such substances as are grouped to avoid disclosing private business, as in the case of single operations in a single county. In the large and complete table just published in Bulletin No. 25 by the State Mining Bureau, from which these figures are taken, the amount and value of each substance in the respective coun-

ties is set forth. It is therefore necessary in some cases to place the figures in the "unapportioned" column.

RELATIVE RANK OF COUNTIES.

1. Shasta.....	\$ 6,737,571
2. Kern.....	2,423,918
3. Calaveras.....	2,355,372
4. Nevada.....	2,145,840
5. Amador.....	1,888,191
6. San Bernardino.....	1,844,239
7. Tuolumne.....	1,710,171
8. Los Angeles.....	1,642,591
9. Siskiyou.....	1,067,451
10. Placer.....	1,025,184
11. Butte.....	879,767
12. Alameda.....	786,366
13. Trinity.....	752,280
14. Inyo.....	668,618
15. Sierra.....	576,182
16. Mariposa.....	542,975
17. Mono.....	521,911
18. Napa.....	516,388
19. San Diego.....	514,522
20. Fresno.....	480,696
21. Santa Clara.....	421,150
22. Plumas.....	403,332
23. Madera.....	400,825
24. Ventura.....	350,570
25. El Dorado.....	347,263
26. Lake.....	331,684
27. Riverside.....	316,608
28. Sacramento.....	302,882
29. Santa Barbara.....	300,148
30. San Benito.....	255,219
31. Santa Cruz.....	195,779
32. Yuba.....	189,754
33. Orange.....	187,341
34. Sonoma.....	173,147
35. San Francisco.....	156,947
36. Marin.....	128,227
37. San Luis Obispo.....	116,083
38. Colusa.....	115,107
39. Humboldt.....	108,425
40. Contra Costa.....	101,900
41. San Joaquin.....	80,456
42. Tulare.....	69,626
43. Monterey.....	50,169
44. Stanislaus.....	29,169
45. Alpine.....	27,747
46. San Mateo.....	15,725
47. Solano.....	12,600
48. Merced.....	12,453
49. Mendocino.....	10,720
50. Del Norte.....	10,612
51. Lassen.....	6,100
52. Tehama.....	6,000
53. Kings.....	5,000
54. Yolo.....	2,300
55. Unapportioned.....	23,280

Total.....\$34,355,981

All the asbestos produced in California in 1901 was from Riverside county and all the antimony from Kern county. Asphalt was produced in the counties of Kern, Los Angeles, San Luis Obispo, San Mateo, Santa Clara, Santa Barbara and Ventura. A quantity was derived from the refining of petroleum. Bituminous rock was quarried in San Benito, San Luis Obispo and Santa Cruz counties. The borax was produced in Inyo, San Bernardino and Ventura counties. Brick clays were utilized in the counties of Alameda, Amador, Butte, Colusa, Fresno, Humboldt, Kern, Inyo, Los Angeles, Riverside, Madera, Marin, Mendocino, Sacramento, San Bernardino, San Diego, San Luis Obispo, San Mateo, Santa Barbara, Santa Clara, Shasta, Sonoma, San Joaquin, Tehama and Tulare. Clay for pottery, etc., came from Amador, Los Angeles, Placer, Riverside and Santa Cruz. The hydraulic cement all came from San Bernardino county and all the chrome from Shasta.

Coal was mined in Amador, Alameda, Contra Costa, Monterey, Orange and Riverside counties. Copper was produced in the counties of Alameda, Alpine, Amador, Calaveras, Fresno, Inyo, Kern, Mariposa, Madera, Merced, Mono, Nevada, Placer, San Bernardino, Sacramento, Shasta, Stanislaus and Trinity. While only eight counties produced copper in 1890, eighteen counties made a product of this metal last year, showing the growth of this industry.

All the fullers earth came from Kern, and all the glass sand from Monterey county. Gold was mined in thirty-five counties of the State and silver was produced in twenty-six counties. Granite was quarried for building purposes, curbing, etc., in the counties of Madera, Placer, Riverside, Sacramento, San Bernardino, San Diego, Shasta, Trinity, Tulare and Sacramento. Graphite was only mined in Sonoma county.

Gypsum was derived from the counties of Orange, Riverside and Los Angeles. Lithia-mica from San Diego, and lead from Inyo, Kern, Mariposa, Mono, San Bernardino and Tuolumne.

Lime was quarried and burned in the counties of Butte, El Dorado, Kern, Mono, Riverside, San Bernardino, Santa Cruz, Shasta and Solano; and limestone was quarried for beet sugar factories, fluxing, paving, etc., in Monterey, Napa, San Bernardino, Santa Cruz and Solano. Macadam was quarried in the counties of Alameda, Los Angeles, Marin, Monterey, Sacramento, San Benito, San Bernardino, San Francisco, San Mateo, Santa Clara, Solano and Sonoma.

Manganese came mainly from Alameda, with a small quantity from Plumas. Magnesite was mined

in Alameda, Napa, Stanislaus, Sonoma, Santa Clara and Tulare counties. All the marble quarried was from Amador county, and all the mineral paint from Calaveras and Stanislaus counties.

Mineral waters were bottled and sold from springs in the counties of Butte, Colusa, Contra Costa, Fresno, Humboldt, Lake, Mendocino, Monterey, Napa, Santa Barbara, San Benito, San Luis Obispo, Santa Clara, Shasta, Siskiyou, Solano, Sonoma and Tehama.

Natural gas was commercially used in Los Angeles, Santa Barbara, San Joaquin and Sacramento counties. Paving blocks were quarried and made in San Bernardino, Solano and Sonoma counties.

Petroleum was derived from the counties of Fresno, Kern, Los Angeles, Orange, Santa Barbara and Ventura. Platinum was found in small quantities in several counties, the most of it in Trinity. Pyrites came from Alameda and Nevada counties, quartz crystals from Calaveras, and quartz sand from Riverside.

Quicksilver was produced in the counties of Colusa, Lake, Napa, San Benito, San Luis Obispo, Santa Clara, Shasta, Sonoma and Trinity. Rubble was quarried in Alameda, Los Angeles, Madera, Marin, Monterey, Placer, Riverside, Sacramento, San Bernardino, San Diego, San Francisco, Santa Barbara and Ventura.

Salt came from Alameda, Colusa, Los Angeles, Riverside, San Mateo and San Diego counties. Sandstone was quarried in Colusa, Santa Barbara, Santa Clara, Ventura and Yolo counties. The serpentine all came from Los Angeles county, the soda from Inyo, the slate from El Dorado, soapstone from Los Angeles, tourmaline from San Diego, and turquoise from San Bernardino county.

As far as the banner counties are concerned in the different mineral products, the following is the record for 1901, with the values of material for the county named:

Alameda leads in coal (\$262,272), manganese (\$423), pyrites (\$18,000) and salt (\$324,136). Amador leads in marble (\$4630), Calaveras in quartz crystals (\$17,500), Colusa in sandstone (\$80,082), and El Dorado in slate (\$38,250). Inyo leads in lead (\$24,040) and soda (\$400,000). Kern leads in antimony (\$8350), fullers earth (\$19,500) and petroleum (\$1,131,616). Los Angeles leads in brick clays (\$264,825), gypsum (\$35,500), serpentine (\$890) and soapstone (\$119). Monterey leads in glass sand (\$15,750), Madera in granite (\$294,799), Nevada in gold (\$2,121,054) and Napa in quicksilver (\$338,176). Riverside leads in asbestos (\$4400), clays for pottery, etc. (\$16,624) and quartz sand (\$500). San Bernardino leads in borax (\$898,130), cement (\$159,842), limestone (\$76,710), rubble (\$151,447) and turquoise (\$20,000). San Diego leads in lithia-mica (\$27,500) and tourmaline (\$20,000). San Francisco quarried the most macadam (\$142,500). San Joaquin utilized the most natural gas (\$60,456). San Luis Obispo produced most values in bituminous rock (\$33,070). The most asphalt came from Santa Barbara (\$55,800). The most lime was burned in Santa Cruz (\$161,500). Shasta county made the largest product of copper (\$4,481,048), silver (\$891,994) and chrome (\$1950). The largest value in mineral waters was from Siskiyou (\$175,000). Sonoma produced the most graphite (\$4480) and paving blocks (\$32,675). The most mineral paint was from Stanislaus (\$375) and the largest quantity of magnesite from Tulare county (\$23,210).

It will be noted that only one county leads in five substances—San Bernardino. Two counties lead in four articles—Alameda and Los Angeles. Those which lead in three are Kern, Riverside and Shasta. The counties of Inyo, San Diego and Sonoma lead in two products. The other counties named in the banner counties only have the lead in one substance each.

Canadian Mining Institute.

A public meeting of the Canadian Mining Institute will be held at Nelson September 10 and 11. The preliminary announcement of papers is as follows:

"Coarse Concentration in the Slocan District," by S. S. Fowler, S. B. Nelson.

"Mine Timbering by the Square Set at Rossland," by Bernard Macdonald, M. E.

"A Comparison of Costs for Compressing Air by Steam and Electric Powers at Rossland," by William Thompson, M. E.

"Safety Lamps and Mine Explosions," by James Ainsworth, M. E., Manchester, England.

"Notes on the Machinery Constituting a Mining Plant," by Alfred C. Garde, M. E., Sandon.

"Mine Signalling by Compressed Air at Rossland," by Bernard Macdonald and William Thompson.

"The Mineral Resources of Vancouver Island," by W. M. Brewer, Vancouver.

Among the publications received this week are "Gold Belt of the Blue Mountains of Oregon," "Ore Deposits of Monte Cristo," "Ore Deposits of Elkhorn Mountain," "Rocky Mountain Coal Fields," "Pacific Coast Coal Fields," "Coal Resources of Alaska," and "Southwestern Coal Fields," issued by the United States Geological Survey, and to be had upon application to the Director United States Geological Survey, Washington, D. C.

The Patio Process for Amalgamation of Silver Ores.*

By MANUEL VALERIO ORTEGA

PATIO AMALGAMATION.—The ore extracted from the mine is sorted by pepenadores, who break the large pieces with hammers, rejecting those which contain no ore, set aside the very rich to be smelted, and deliver the rest to be crushed and pulverized for direct amalgamation in the patio. The broken lumps, of about fist size, are first ground in Chilean mills, and then reduced, in arrastras or tahonas, to fine slime.

After the lama or slime has acquired a suitable consistency by the evaporation, through the sun's heat, of a part of the water which it contained, it is spread upon the patio or amalgamating floor, where it is mixed with 5% or 6% of common salt. The next day a certain amount (depending upon the nature of the ore and the season of the year) of bluestone (copper sulphate) is added, and, immediately afterwards, mercury in the proportion of eight units to one of silver contained in the mineral, squeezed through a piece of thick cloth or chamois skin, and spread over the pulp or torta. These chemicals are thoroughly mixed with the slime by means of horses or mules trampling the torta—an operation called the repaso, and repeated daily until the treatment is finished. The time required is from two to five weeks, depending upon the quality of the ore, the temperature of the locality, and the period of the year.

Samples are taken at intervals for assay by washing in a vanning bowl, and when the tests show that amalgamation is too slow more bluestone is added. If it be too active (from the presence of copper sulphate in excess, as indicated by gray color and floured mercury), it is retarded by the introduction of lime, cement copper or wood ashes. At the end of the process it is usual in some places to make a final considerable addition of mercury, in order to collect the grains of amalgam.

Amalgamation being finished, the torta is transferred to deep circular stone vats, or settlers, through which water is passing, agitated by a revolving paddle. The amalgam and other heavy metalliferous materials collect in the bottom, while the light, earthy impurities are held in suspension and carried away.

The fluid amalgam thus obtained is squeezed through canvas bags, whereby the excess of mercury is forced out, and there remains a solid or pasty argentiferous amalgam, containing about one-fifth of its weight of silver. This is compressed into triangular segments, which are transferred to the quemaderas, or retorting houses, for the separation of the mercury by heat.

When in the solution of salt and bluestone that we are studying we add a certain quantity of mercury and the liquid is shaken there appear two kinds of precipitates, both white; but the first one is heavy, and the other floats for a long while. The one is blackened by ammonia and the other is dissolved at last and imparts a blue color to the ammonia. At the same time the mercury is subdivided and becomes gray, and sometimes black. If it is washed and rubbed hard, it separates the same white, heavy substance that we have mentioned. This is nothing but calomel, and the other is pure cuprous chloride.

Not all the cupric chloride formed is converted into cuprous chloride, for the reaction can take place only by direct contact, and the volume of mercury is very small compared with that of the pulp. Moreover, the solution of chloride of copper is weak. Supposing that for each ton of ground ore containing 700 kilos of water 3 kilos of bluestone were used, the cupric solution would not be over 0.5% in strength.

On the other hand, the accident known in practice as calentura, which is recognized by the rapid formation of mercurous chloride, is due to an excess of cuprous sulphate; whereas, if the action of the cupric chlorides formed by it would fall on the silver sulphide, its effect ought only to hasten the amalgamation without injuring the quicksilver at all.

Again, it is well known that when horn silver is submitted to the patio process it encounters the same accident, owing to the stronger affinity of chlorine than of silver for mercury; and if such a thing happens to the combination of silver and chlorine already made, how can we admit that the cupric chloride will act on the argentic sulphide in proportion to metallic mercury?

Native chloride of silver (horn silver) never has been treated successfully on the patio. This difficulty was the origin of the caso or caldron process invented by Barba, in which the reduction of such chloride is made by the metallic copper of the apparatus, and not by the quicksilver. Yet, according to the theory we are analyzing, horn silver ought to be the best ore for the patio, since nature has already operated in it the chemical combination attributed to the salt and bluestone of that process.

To show how difficult it is to treat artificial chlorides of silver by the patio I made the following test: In the lixiviation process the ores are first chloridized, in order to extract the silver by a solution of sodium hyposulphite. I took a ton of ore so pre-

pared and worked it with mercury only, as the silver was already converted into chloride, and there was no need of chemicals to chloridize it. After a month's treatment there appeared no trace of amalgamation. I then added the usual amounts of salt and bluestone. There was an immediate change in the appearance of the mercury, which became coated with a gray, opaque film; but, notwithstanding this, it did not catch any silver, and when washed out, after two months' treatment, half the weight of the quicksilver had been lost and the remainder contained very little—almost nothing—of silver.

If there were really, in the patio, a formation of chloride of silver, subsequently reduced by the mercury, the loss of mercury should be 1.85 times the weight of the silver obtained. This is not the case. In the majority of instances the total loss of quicksilver, including the inevitable waste in the several manipulations, is between 1.25 and 1.5 times the weight of silver obtained.

In the caso, as well as in the barrel, used at Freiberg, where the ores contain silver in the state of chloride, either natural or artificial, the loss of mercury is very small, say from 5% to 10% of the silver, because in those processes the reduction of the chlorides is effected by metallic copper or iron. But when those metals have been tried on the patio the result has been negative. In this respect Mr. Usler says:

"The object of another series of experiments was to protect the quicksilver by means of metallic copper and iron, but the results were entirely different from what was expected. Where there was iron there was no amalgamation. A small quantity of copper seemed to do good, the loss of quicksilver being somewhat less; but the amalgam contained a certain amount of copper, and if the quantity of this metal was increased the resulting amalgam contained no silver, but copper."

The explanation of all this is very clear. Probably the iron was added in excess, and all the cupric chloride was reduced, and, when copper in small quantity was used, some cuprous chloride was formed; but when copper was added in greater quantity it amalgamated before the silver.

In the tortas under treatment there has never been found a single particle of chloride of silver, notwithstanding it has been looked for with positive care. It can scarcely be argued that this is the result of the reduction of the argentic salt by the mercury, because immediate contact between the two is impossible, since the argentic chloride should be dissolved in statu nascendi in the brine with which all the mass is impregnated. There cannot be, therefore, an instantaneous and complete reduction by mercury to explain the observed absence of argentic chloride in the torta—which thus constitutes a strong argument against the formation of that salt in the patio process.

The important function of the cuprous chloride is similar to that of nitrous acid in the manufacture of sulphuric acid, being only the conductor of oxygen absorbed from the atmosphere, first to oxidize the mercury, and secondly to produce sulphuric acid with the sulphur of the argentic sulphide, leaving the silver in the nascent state to form amalgam with the excess of mercury.

At first sight it seems that the loss of quicksilver should be large if this reaction occurs; but that it is, in fact, much less than the so-called consumido, which is unit per unit, will appear from the two formulas corresponding to argentic chloride and mercurous sulphate, respectively:

The oxidation of mercury explains perfectly the accident called frio in the amalgamation, which is characterized by the yellow and sometimes black color of the quicksilver as due to the insufficient strength of the cuprous solution to produce the sulphuric acid, with which the oxide of mercury must combine. This is the reason that amalgamation stops, and to remedy this defect more bluestone must be added.

It may be objected that mercurous sulphate never has been found in the tortas, but the reason is that as soon as it is formed it is converted into mercurous chloride, on account of the excess of chloride of sodium present. It is well known that mercurous sulphate is sometimes employed to prepare calomel by the method of Haermstedt and Planché.

It may be further objected: If there is no chlorination of the silver, what is the use of such an enormous quantity of salt? I think the object of that strong solution of chloride of sodium is to dissolve the cuprous chloride to facilitate its oxidizing action. According to data published by Dr. Sterry Hunt, the solubility of this chloride in a solution of salt increases remarkably with the strength and temperature of the latter. Moreover, in the pan method very little salt is used. Mr. Eisler says:

"Ten pounds of salt is put in each pan to treat half a ton of ore, at a temperature of 180° F., which quantity is about 20% of the salt used in the patio at the ordinary temperature."

It is on this account, also, that the patio treatment takes longer in winter than in summer, namely, the lower temperature diminishes the amount of cuprous chloride dissolved.

Reformed Copper Ores.

Written for the MINING AND SCIENTIFIC PRESS by J. C. GOODWIN.

SOME OF THE INFLUENCES THAT COUNTRY OR WALL ROCK OF A VEIN HAVE UPON ORES BEING DEPOSITED FROM THE BREAKING DOWN OF THE SULPHIDES OF COPPER.—As I leaned against Sentinel rock, far above the main town of Bisbee, Arizona, I looked south down a deep gulch, then to the west along the east side of the Queen hill, a sub-carboniferous limestone, dipping to the west at an angle of about 30°; on the side of the gulch that I was standing is a great feldspathic dike. Some geologists have called it a rhyolite—an eruptive dike. This dike is some 2 miles wide and from 10 to 15 long. As I looked around and studied the geology of the surrounding country I concluded that a great horizontal bed of limestone once existed for many miles in all directions. But during a continental uplift this limestone was flexured, making a great anticline. This flexure was some thousand feet in height and many miles in span. In its formation this flexure broke along the apex of its axis and through this fissure an igneous dike flowed up, dissolving the limestone for a distance of about 2 miles, forming the dike I have described; above this dike is acid in composition and contains fragments of iron sulphides below the point of decomposition.

Sentinel rock on which I leaned, although on the east side of the gulch, is not a feldspathic rock, but limestone. Farther down the gulch all of the limestone is on the west side, and yet farther down opposite the Copper King, all of the gulch is in the feldspathic rock. As I looked west high above the Copper Queen mine, to the top of Queen hill, I was convinced that at one time the limestone extended across the gulch and to the top of the rhyolite dike, and that also at one time no gulch existed where it is to-day; 500 feet above the town of Bisbee; and to the east, the contact between the limestone and rhyolite was all that would have been found. The contact, being soft, eroded easily and the formation of the gulch began. It began to cut down, down and toward the west, and a great gulch is the result. The elements did what man might not have done. It broke off the face of the west monocline and exposed a deposit of copper ore. It cut out a canyon hundreds of feet wide and hundreds of feet deep, and exposed indications that induced mining men to sink the Holbrook, the Czar and Spray shafts. This vast eroding has made it possible for the Calumet & Arizona Co. to discover copper ore.

The cutting out of this canyon discovered the Bisbee mine, and I will venture to say that if no gulch had been cut deep on the contact there would be no Bisbee to-day. I called the attention of the prospector to these facts, namely, that many great ore bodies are buried deep with no surface indications to show their presence. Originally only one outcrop of copper was exposed at Bisbee and there was no other surface indication except an iron gossan dike that contained no copper on the surface. This exposure is on the east side of the Queen hill and about 200 feet above the gulch. Erosion had broken away the eastern face of this limestone hill and exposed a solid body of oxidized copper, iron and manganese ores. This body of ore, about 60 feet by 60 feet in area, yielded about 23% of metallic copper. This ore body dipped into the hill at an angle of about 30° southeastwardly. Between the 200 and 300-foot levels it changed into clay, but below this zone copper carbonate and oxides were found that assayed about 20% in copper. At the 400-foot level on the incline from the surface this ore body terminated abruptly in hard limestone.

A large group of claims on the south slope of the Queen hill had been explored by the Neptune Co.; finding no ore, in 1880 had suspended operations. Another company, the Atlanta Mining Co., had searched for more than three years unsuccessfully for a body of ore. The Atlanta Co. decided to make one more attempt to discover ore before abandoning their enterprise. The Queen at this time had but three months of ore in sight. The Atlanta Co. concluded to sink a shaft southward of the point toward which the Queen was drifting. Neither company was following copper indications, but each was exploring the hard limestone yet almost at the time each struck a body of ore. The consolidation of these two companies and other claims constitutes the great Copper Queen Mining Co. For matter pertaining to the history and the working of the Copper Queen mine I am indebted to Prof. James Douglas. It is taken from his report on the Copper Queen, read before the American Institute of Mining Engineers.

As I stood by the side of Sentinel rock many questions entered my mind. How were these great bodies of ore now being worked originally deposited? What chemical changes and mechanical agencies had deposited some of the ores that the Copper Queen Co. are now bringing to the surface? Why were not the reformed ores the same as found in many other great mines, instead of a honeycombed quartz vein as found at Butte, Montana? What caused this vein? Why are great bodies of manganese oxide found filling great cavities high up in the limestone? Why are not manganese oxides found in all great copper mines? Did the country rock give character to the ores?

Extraction of Gold by Chlorobromuration.*

C. GROULET'S PROCESS.

NUMBER III—CONCLUDED.

Roasting is more often necessary with Groulet's chlorobromuration process than with the cyanide process, but the cost of roasting is not included in the cost of the process, inasmuch as it would also be necessary to include the profits that can be obtained with the sulphur, arsenic, antimony and tellurium, these profits exceeding the cost of roasting. With chlorobromuration, amalgamation is not employed. The ore is either treated directly after stamping or treated after concentration. The concentration is effected by means of a special table that permits, as a rule, the ore to be divided into two classes: A first class containing auriferous pulps, and a second class containing no gold, or hardly any. Numerous experiments made with ores of varied character have shown that the special costs of chlorobromuration vary from 2.10 francs to 5.50 francs per ton for a mill treating 100 tons.

An auriferous mispickel treated by chlorobromuration cost (labor, motive power, chemicals, supplies and maintenance) 5 50 francs per ton. The analysis of this ore was as follows:

	Per cent.
Silica.....	19 30
Arsenic.....	35 47
Metallic iron.....	26 29
Sulphur.....	19.03

Total.....	100.09
Gold, per ton, grams.....	36

The mean yield was 96%. With an ore of this kind no preliminary concentration was made. It would not have been advantageous from an economic point of view. An auriferous pyrites from the Transvaal gave the following results:

	Per cent
Insoluble gangue.....	93 10
Iron.....	3 01
Alumina.....	1.32
Lime.....	trace.
Sulphur.....	1.37

Total.....	98 80
Gold, per ton, grams.....	20

After stamping and roasting, without concentration, the ore was treated by chlorobromuration. The special costs of chlorobromuration amounted, in France, to 4.25 francs per ton (labor, motive power, chemicals, maintenance and supplies). These costs of chlorobromuration would amount in the Transvaal to 5.50 francs per ton, taking coal at 30 francs a ton and labor as follows:

	Francs per month
Foreman.....	1,200
Assistants.....	750
Assayer.....	900
White labor.....	400
Black labor.....	95

The same ore was concentrated on a special table and the results indicated by the following analyses were obtained:

	Pulp.	Residue.
	%	%
Silica.....	5.70	97 20
Ferric oxide and alumina.....	2 06
Metallic iron.....	43.16
Lime.....	trace
Sulphur.....	50.22	nil

Totals.....	99 08	99.26
Gold per tons, grams.....	390	2

The concentration yielded, per ton of ore stamped:

	Kilograms.
Pulp.....	46 500
Tailings.....	953.500

Total.....1,000.000

The tailings containing two grams of gold per ton were thrown aside. The loss thus caused was 191 grams for 95.35 tons, on the assumption that the mill treats 100 tons a day.

Other experiments have been made with an auriferous pyrites from North Wales; after stamping this ore was concentrated. The following are the results of an analysis of the original ore, of the concentrates, and of the tailings:

	Original ore.	Concentrates.	Tailings.
	%	%	%
Silica.....	98.30	91.30	98.50
Ferric oxide and alumina.....	1.20
Metallic iron.....	0.21	2 96
Lead.....	0.28	2.27
Lime.....	trace
Sulphur.....	0.37	4.01	nil

Totals.....	99.16	100.54	99.70
Gold per ton, grams.....	3	34	nil

On concentration the ton of ore stamped yielded:

	Kilograms.
Concentrates.....	100
Tailings.....	900

Total.....1,000

*Condensed.

The special costs of chlorobromuration (labor, motive power, chemicals, supplies and maintenance) amounted to 5.20 francs per ton of concentrates. They were therefore for the ten tons of concentrates 52 francs. To these costs must be added those of concentration, 0.80 francs per ton of ore stamped, making 80 francs, and those of roasting 100 francs.

The total special costs of treatment amounted to 232 francs for 100 tons stamped, or 2.32 francs per ton stamped.

Here, however, the concentration gave no loss, and the total yield was 96.5%.

A mill treating fifty tons of ore a day by Groulet's chlorobromuration process is in operation at Harfleur, near Le Havre, France.

The Absorbent Roller.

Criticism of the wheel conveyor centers upon the rapid wearing of its supporting rollers and their

from the short life of the carrying rollers. The problem of effectively and continuously lubricating these rollers and their journals, and so preventing excessive wear, has engaged attention. Assuming correctness of theory and design in the machine as a whole, it is a perfection of details that makes success and defects failure. An invention which appears to solve the problem of roller lubrication has been patented by the Link-Belt Companies and is applied to all wheel conveyors of their manufacture. Roller lubrication produced the chambered roller, whose interior space is either filled with oil-saturated packing or supplied with oil by fingers, which, dipping into an oil reservoir in the path of rollers, lubricates the journal at intervals without the interposition of the packing. The manufacturers say that the Link-Belt absorbent roller embodies these advantages, as it is provided with fibrous packing, securing the advantage of capillary attraction and conveying oil to the journal of the roller, and combines with this automatic and convenient means of renewing the supply of oil.

Fig. 1 shows the front view of this roller. Fig. 2 is a cross section. In Fig. 3 is shown a method of supplying oil to the absorbent packing when the carrier is either wholly vertical or inclined. Under these conditions the oil is fed to the roller from an over hanging reservoir, the feed being governed by small cocks. Fig. 4 shows the method of supplying the oil on a horizontal run of conveyor, the bar or oil rod running downward from the oil tank is hinged at one end and so guided at the other that it bears on the exposed surfaces. The oil, supplied in a small and continuous flow from the oil tank, is wiped off by contact with the packing, and a continuous feed through the medium of this packing is maintained to the bearing sections of roller and journal.

There is a wide field open for the use of this invention. The principle is not one limited in its application to conveying machines, but of value for maintaining lubrication in thousands of places

FIG. 3.

FIG. 1.

FIG. 2.

FIG. 4.

journals. Carriers and conveyors of this class are in wide and extended use; but their introduction has been hampered by knowledge of delays resulting

where intermittent oiling may cause not only destruction of bearing surfaces, but even the greater losses from fires, caused by dry bearings. The manufac-

turers of this absorbent roller assert their ability to fully meet the requirements in broad application of the invention. Experiments have been made to determine the best oil for use on the absorbent rollers. Heavy black oil is unsuitable. Best results are obtained with oil of a moderate viscosity and high lubricating quality.

Resumption at Mackay, Idaho.

Herewith is a picture taken specially for this paper of the town of Mackay, Idaho, whereat is situated the property of the White Knob Copper Co., the last mining operations with which the late Jno. W. Mackay was connected.

Conditions that recently caused the closing down of the properties of the White Knob Copper Co. have been overcome and operations are resumed after a suspension since June 26th. S. F. Boyd is general manager, J. D. A. Smith superintendent of

White Knob Copper Co.'s Property, Mackay, Idaho.

the smelter, T. Brown electrical engineer and G. R. Hancock superintendent of the mines.

It is the intention to proceed on a limited output until such time as the tunnel is completed. The new smelter will be ready September 3rd; it has a capacity for 600 tons ore daily. The railroad, 10 miles of track, 6% grade, is ready and conditions look favorable to success.

Copper in Northern California.

By J. S. DILLER.

Within the last five years northern California has taken rank among the great copper producing regions of the United States. In 1900 it stood fourth in the series, having produced over 1400 tons, with Montana, Lake Superior and Arizona, respectively, still far in the lead. The output is rapidly increasing, and bids fair to continue to do so with the operating of other mines and the erection of smelters now contemplated.

The copper region lies in Shasta county, among the hills about the northern end of the Sacramento valley, and is largely embraced in the Redding quadrangle, of which the United States Geological Survey has now ready for distribution a contoured topographic map on the scale of about 2 miles to 1 inch. Upon the completion of the topographic map the writer spent two months (August and September, 1901,) making a general geological study of the copper region in the preparation of a geologic map for folio publication. The work will be completed next summer, but, in the meantime, on account of the great geological interest in the region and its economic importance, coupled with the fact that comparatively little has been written concerning it, a preliminary note may not be out of place.

The copper region contains an extensive series of sedimentary rocks, ranging from the Miocene into the Devonian, associated with igneous masses of various ages and kinds which have intercalated or intruded the sedimentaries. A number of mountain building epochs are recorded by breaks already recognized in the stratigraphic and faunal succession, and others will doubtless be discovered in the detailed survey. The general abundance of fossils in the Cretaceous, Jurassic, Triassic, Carboniferous and Devonian sediments is such as to render it possible to work out the structure in detail with a much higher degree of probability than is usually the case.

The ore deposits of the copper region may be conveniently considered in three groups—auriferous quartz veins, sulphides in shear zones.

Auriferous quartz veins are most abundant in the western part of the copper region about Quartz Hill and Old Diggings, a few miles north of Redding, where, although the ores are generally too low grade to pay for milling, they may be smelted with the copper sulphides at a profit. The copper industry has thus invigorated the gold mining, which in the early placer days was the greater resource of the region. The quartz veins have a wide range in size and position. In the National mine a 3-foot vein strikes

north 25° west, dipping 45° to the southwest. The Texas shows a nearly vertical vein, sometimes over 5 feet thick, with strike nearly north and south, while at Quartz Hill the 40-foot vein strikes north 45° east, and dips 70° to the southeast. Further study may result in separating these veins into groups of different ages. They all contain some auriferous pyrite or native gold, and often chalcopyrite, but the vein matter is in most cases almost wholly quartz. Within the copper region nearly a dozen mines in this sort of deposit are active, and yet the output is comparatively small.

The Black Diamond mine, near Bayha, about 20 miles northeast of Redding, is an interesting example of this type. Under the management of C. Doppstein a small but well equipped force is at work developing. At the Rudolph opening slaty shales occur, dipping easterly, apparently beneath the Carboniferous limestone which forms the crest of the ridge. Small masses of pyrrhotite and chalcopyrite

occur, also pyrite and magnetite, with limonite and other secondary minerals. The ore is associated with coarsely crystalline fibrous diopside and garnet, whose relations are not so easily perceived underground, but upon the surface are illustrated at many points in the neighborhood along the contacts of diabase dikes, which cut the Carboniferous limestone. The Black Diamond mine embraces many tunnels and open cuts on both sides of the hill of Carboniferous limestone, and most of them show the effects of contact metamorphism. The best exposures are upon the crest of the limestone ridge, where it is crosscut by a number of diabase dikes running east and west and ranging from 5 to 100 feet in width. Along the edges of these dikes, in contact with the limestone at many points, pits have been dug into the iron-stained fibrous masses of diopside, mixed occasionally with garnet, serpentine and traces of ores. The fibers of diopside, several inches in length, are perpendicular to the contact and are conspicuous. The Roseman group of mines are near by upon the same dikes. All the openings and tunnels of the Roseman and Black Diamond mines were not examined, but as far as seen the small ore bodies of sulphides and magnetite were always associated with diopside in contact zones. The dike rock in question, here designated diabase, is composed largely of calcic feldspar, which generally has the optite arrangement characteristic of diabase inclosing chlorite, epidote, magnetite and quartz from the altered feldspar and pyroxenes. The amount of quartz varies, and in some cases seems a primary constituent.

A wide and very irregular belt of igneous rocks extends northeast through the copper region of Shasta county, from near Iron Mountain to beyond Bully Hill, and traverses a series of fossiliferous sedimentary rocks, ranging from the Devonian up into the Mesozoic, at least as far as to near the top of the Triassic. A large portion of this mass is volcanic, embracing acid and basic lavas with fossiliferous tuffs, which show that a portion of the series, and possibly the whole, is of Triassic age.

The igneous rocks and associated sedimentaries have been greatly compressed, folded, faulted and sheared. The shear zones in some cases have been mineralized, developing in spots by replacement irregular bodies of sulphide ore, ranging in size from a mere film or nodule to masses many hundreds of feet in greatest dimension. Deposits of this sort are the only ones which have been successfully mined.

The ore bodies thus far exploited have generally been found in igneous rocks (keratophy, closely related to quartz porphyry), although, in some cases, within a short distance of sediments. The sheared keratophy in many cases resembles shale, and is so called by the miners, but a microscopic examination readily distinguished it from the sedimentary rocks which generally contain microscopic fossils, such as radiolaria, sponge spicules and other siliceous organisms.

All the copper produced in the region under consideration comes from two districts—Iron Mountain and Bully Hill—and these deserve special mention.

(TO BE CONTINUED.)

Hints to Prospectors.

Written for the MINING AND SCIENTIFIC PRESS by
W. J. ADAMS, E. M.

The average prospector starts to explore a new country with his pick and pan, but only looks for gold and silver. He follows up the streams and gulches, and if colors of gold are found, traces them to their source. If ledges are encountered they are tested by assay for gold, silver, lead and copper; but beyond that, little if any account is taken of the rocks of the country except as curious freaks of Nature.

In the placer mining of the Black Hills the miners were troubled with heavy pebbles, locally called blackjack. On account of the weight of these and of the same mineral when found in place, it was taken for silver ore, but no silver ore could be found by assay. Finally it was discovered to be stream tin and cassiterite in a matrix of feldspar or mica.

In the beach mining along the Pacific coast line there were generally collected with the amalgam, small scales, either a dull lead color or bright-like nickel, which were heavier than the amalgam, though untouched by quicksilver. This was thrown away for years, but was nearly as valuable as the gold, ounce for ounce, consisting of platinum and its alloys.

In Colorado, at Rock Creek, a canary-yellow deposit was found, in appearance like sulphur and clay, but very heavy. This was found to be a compound of uranium and vanadium, called carnotite, and of good commercial value.

In San Diego county, California, a peculiar deposit was found carrying radiating reddish crystals. Money has been made from this through its constituent of lithium. Lately another deposit has been found where these crystals have been of various colors, some so clear as to be valuable as gems. In Siskiyou county, California, a deposit has lately been found, greenish and very hard, which is the genuine jade of great value.

There are other deposits of value, besides the gold and silver content, all over this western country, in the Sierras as well as the Rockies, and it is the object of this article to call the attention of prospectors to this phase of explorations.

The writer has made a specialty of these rarer crystallizations and commercial deposits, and writes with confidence on the subject, realizing how often valuable deposits may be passed by.

Of the metals, rutile occurs in twin crystals of a glassy red color, in a feldspar gangue, and is now commercially worked in North Carolina.

Molybdenite looks like graphite, occurs on the Pacific coast in quartz; in Mexico, in feldite, and is of value in limited quantities if over 60%. It can be concentrated by saving the slimes.

Wolframite, tungstate of iron, has been found associated with the tin ores of Temescal, Riverside county, California, and is of value.

Cassiterite, tin oxide, only found in granites or its allied minerals, never in slate.

Stibnite, antimony, is of value if near transportation, and carrying over 50% of antimony. It looks like galena, but is fibrous and lighter colored.

Chrome iron has been mined on the Pacific coast, but is not valuable till steel works are located on the hays of the Pacific.

Bismuth is found in one mine in a county near San Francisco, California, but, like the blackjack of the Black Hills, has so far been considered a valueless product by the prospector, though there is a market for a limited amount.

Lead—This occurs as carbonate (cerussite), a heavy light-colored earthy mineral; as sulphide (galena), of a bright lead color; and rarer, as wulfenite, of a bright orange color, and anglesite, the sulphate. The ores of this metal are variable in value according to the expense of transportation, the extent of the ore bodies and the percentage of the metal contents; but, with the present price of lead, many mines formerly idle should now pay a profit.

Sulphur—A bright yellow earth which is generally mixed with volcanic ash, as near Humboldt Wells, Nevada. For years the principal source of supply for the Pacific coast was in Japan, but a deposit is now being exploited in Lower California. It is possible that deposits would be found near some of the extinct volcanoes of California, such as Lassen Buttes. In spite of the increased use of iron pyrites for the manufacture of sulphuric acid, pure sulphur is in constant demand.

Graphite, "black lead"—Small quantities of this are found the length and breadth of California, but only when of superior quality can it compete with that which is artificially made.

Asbestos—A white or greenish mineral, fibrous like wool. Generally the fiber is very short, when the mineral is of little value. Though found in numerous localities on the Pacific coast, the deposits so far known are limited in size and poor in quality. A good asbestos will be associated with serpentine rocks, and should occur in the Sierra Nevada and in Siskiyou county, California. For this there is a market.

Mica in large sheets and free from iron has a ready sale.

Crystals—Not all crystals are of value, but it is the gems of which we know little that the prospector should take note, preserving in his hook for future

reference, locality, nature of country rock and extent of deposit.

A few diamonds have been found in several gold gravel mines of California, and quartz crystals, tons in weight, have been shipped from Calaveras county, California. Among other crystals, if specimens are found clear and uniformly colored, they should be saved, particularly red garnets (almandite), green garnets (ourarorite), and the long crystals of colored tourmalines; while among the gem stones, non-crystalline, very often valuable specimens of green chrysoprase, agates, onyx, cat's-eye and opals are found.

The turquoise found in California is superior to that of New Mexico, being without the iron specks of the latter.

There is no reason to doubt but that other gems exist in the mountain ranges of the Pacific coast, where we have the eruptive actions as shown particularly in the Siskiyou on the border of California and Oregon, and the ranges on the borders of southwestern Nevada and eastern California.

The Earths—Only a few of these are worthy of the prospector's attention. Kaolin, for porcelain, is too plentiful; but infusorial earth and Fuller's earth look so closely similar to it that, without chemical tests, the difference cannot be seen.

Magnesite is also white but heavy, while magnesia resembles soft chalk; but of all these the most valuable would be deposits of niter and horax, gypsum and alum.

Salt, having no magnesia, and if in a deposit of sufficient extent, should find a remunerative market and free the coast from the excessive tariff now charged.

The writer suggests to all prospectors to save unknown crystals, with the data of their locality; small specimens of unknown rocks and minerals, and the data connected with them, and submit them to some competent authority for valuation. He may find he has a better proposition than a gold mine.

Mining and Metallurgical Patents.

Patents Issued July 22, 1902.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

WATER WHEEL.—No. 705,087; J. W. Houtz, Republic, Mo.

Overshot water wheel having series of stationary buckets, space intervening between inner end of bucket and wall of adjacent bucket, tubular valve positioned in each bucket and adapted to close space while bucket is being loaded with water.

ORE WASHER AND SEPARATOR.—No. 705,104; J. M. Longan, Empire City, Kan.

Ore washer and separator, combination of a water tank having discharge gate on one side, revolvable vertically movable float table in tank, feed hopper revolvable independently thereof, sweep connected to and carried by feed hopper, sweep being adapted to operate on table, means to raise and lower sweep, and means to adjust same.

PROCESS OF PURIFYING HYDROCARBON OILS.—No. 705,163; J. W. Warren, Omaha, Neb.

Clarifying hydrocarbon oils, treating with solution of sugar of lead; absorbing water and any foreign substances resulting from such latter operation by addition of clay of Wyoming rock-clay constitution; drawing off distillate; treating it with sulphuric acid;

neutralizing same by addition of clay; drawing off distillate; treating it with caustic potash; allowing it to stand; retreating distillate with clay; finally, when clear, drawing off distillate.

FURNACE FEEDING APPARATUS.—No. 705,246; W. H. Howard, Pueblo, Colo.

Combination with furnace, of traveling crane, feed box supported and adapted to be raised into feeding position thereby, cover for feed box also supported by crane and in path of vertical movement of box, supports for box being longer than those for cover so that when box is lowered to filling position cover will be arrested and held suspended before box reaches its lowest point.

PULVERIZER.—No. 705,323; R. Creuzhaur, Brooklyn, N. Y.

Combination with pulverizer of feeding device comprising chambered rotative cylinder, hopper above cylinder, side of which on ascending side of cylinder is extended to form shield over latter covering chambers and preventing entrance of stone into until they have reached approximately uppermost position, thereby avoiding the falling of stone into ascending chambers of cylinder, and consequent necessity of lifting weight of such stone, hopper formed with its side over descending side of cylinder, inclined toward middle terminating some distance above cylinder to prevent stone crowding upon cylinder.

STRAINER FOR MINE PUMPS.—No. 705,364; J. Kurtz, Greensburg, Pa.

Strainer attachment for suction pumps comprising box or casing having sides perforated, strainer held within box or casing, door slidably retained in one end of casing having series of apertures produced therein, hose connected to strainer, hlock arranged in forward end of box having recess produced in upper face thereof, guides arranged adjacent, movable hlock held in guides having recess produced in lower face thereof adapted to register with recess in first named hlock, screw operating in box or casing adapted for engagement with movable hlock, arms carried by screw and pin arranged upon casing adapted for engagement by one of arms of screw, means arranged within box or casing for holding said strainer in position.

METHOD OF REDUCING COPPER MATTE TO REFINED COPPER.—No. 705,109; G. Mitchell, Naco, Ariz.

Reducing copper matte to refined copper consisting in blowing copper matte in converter until practically all the iron contained in the charge has been transformed into slag, removing slag, then blowing remaining charge until it has been reduced to metallic copper and continuing blowing operation until metallic copper has been sufficiently overblown to produce small percentage of suboxide of copper and approximating as nearly as is possible amount required to prepare copper for poling, punching tuyeres during the blowing of charge to maintain constant and practically uniform distribution of air throughout charge; then charging molten contents of converter into reverberatory furnace and subjecting it to the poling process, finally casting product

into pigs, bars or anodes. Charging two or more converter charges into reverberatory furnace, adding to such accumulated charge one or more additional converter charges blown to such a predetermined condition that when mixed with the accumulated charges they will cause the mass to contain the desired percentage of suboxide of copper.

SAFETY HOISTING HOOK FOR ORE BUCKETS, ETC.—No. 705,526; H. B. Gray, Conneaut, Ohio.

Hook for hoisting buckets and other articles, provided with safety guard, having V-shaped notch in its end and adapted to move to and from point of hook, pawl and ratchet, arranged to lock safety guard in contact with hook, notch receiving point of latter. Shank having middle opening and two corresponding curved slots in its sides and hook proper integral with it, in combination with safety guard adapted to fit on point and provided with ratchet and gudgeons, and pawl pivoted within opening arranged to engage ratchet when shank of hook tilts forward, for purpose of holding safety guard on hook point.

GAS FURNACE.—No. 705,077; F. G. Hamer, Cincinnati, Ohio.

Heating furnace, combination of outer inclosure forming heating chamber within, horizontally disposed head 18 closing upper part of chamber by being supported all around on outer inclosure, smoke chamber 26 above this head, smoke flues passing through latter and connecting heating chamber below it with smoke chamber above it, horizontally disposed hollow base 21 in lower part of heating chamber arranged around sides thereof, pipes 22 connecting base with head 18 in manner to leave space between them, drop heating tubes depending from head 18 filling this space arranged in pairs, independent joint 24, box-shaped and of copper which connects to lower end of each pair, one of tubes of such pair of larger diameter than other and means to supply heat to furnace.

Electric Blindness.

Commenting on the increasing use of the electric furnace, which is stated to induce electric blindness, a writer in the American Electrician says:

The eyes do not burn or pain at the time of exposure to the arc, but become very painful two or three hours afterward. Eyes so affected are very red, and have small white spots in them. I am informed that in many cases permanent injury is sustained, so that one can not be too careful in exposing the eyes to this powerful heat. As soon as any pain is experienced from this cause, the eyes should be bathed twice a day in cold water, from 1½ to 2 hours each time, and one drop of the remedy specified in the accompanying prescription should be put in each eye every three hours; the cold water baths should be timed so as to come midway between two applications of the eye drops:

Holocain muriatic (100)3 grams
Adrenalin chloride (1000)3 grams
Distilled water4 cu. cm

The patient should remain indoors and wear very dark glasses until the eyes are restored to their normal condition, and direct exposure to any light should be carefully avoided.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

(Special Correspondence).—Development of this section is progressing and results this season will be satisfactory. The largest enterprise nearing completion is the pumping plant of the Wild Goose M. Co., C. D. Lane president, near the mouth of Smoke river, 18 inch pipes conveying the water 4 miles up the hills off Anvil creek. The W. G. M. Co. will hydraulic their claim No. 2 below discovery on Anvil creek, and also their Nos. 8, 9, 10, 11 above on Anvil creek, and the Mattle claim on the divide between Dexter and Anvil creeks.

The next biggest development work is the ditch made by Leland, Davidson & Bliss from the mouth of Hobson creek to Snow gulch and Dexter creeks. Those people are employing 300 men and 100 horses. The ditch will be a boon to Dexter creek, which is entirely dry during the larger part of the season. The work will be completed in September and should add largely to the output this season. The same company is building a ditch from the headwaters of Skootchebork to Daniels creek and El Dorado creek, where big bodies of pay gravel have been uncovered.

A ditch is in contemplation on Solomon river, where new discoveries, principally on the benches, have been made.

Ophir creek, a tributary to the Neukluk, is the banner creek of this section. On a claim No. 15 above, owned by Chas. D. Lane, a body of pay gravel 26 feet thick has been uncovered and will be worked on a large scale this season.

Near Nome, on the tundra, a number of shafts to the depth of 110 feet have been sunk, with the result of finding a body of 8 to 10 feet of pay gravel averaging 10 cents to the pan.

Otter creek, a tributary of Nome river, has been worked last winter with very gratifying results. No. 1 below discovery produced \$21,000. However, the benches are attracting a good deal of attention on that creek at present and great things are promised from that source.

There have lately been a large number of benches uncovered, and the probability is that next winter there will be a great deal of winter work done. Up to now the excessive price of coal was the only drawback in the development of the camp during the winter months.

The Kasatdegapo is attracting a little attention. Willow creek and Ruby creek are the principal producing creeks.

Concerning Candle creek, the new diggings in the Fairhaven district, very conflicting rumors are being circulated. They say the pay streak is very narrow, only 1 inch thick and 15 to 20 feet wide, and only 2 to 3 feet from the surface. In places the pay streak is rich and it may be a good rocking proposition. However, it will not pay to work the claims on a large scale. On the other hand, it is again contended that very little is known about the creek and that two months more must elapse before anything definite can be said of that section.

The Kougrook and Gold Run sections are not prospected as yet, to make any statements. The York section is being prospected for tin by several Salt Lake parties. The result is not known as yet.

Nome, July 8.

ARIZONA.

COCHISE COUNTY.

The Black Diamond Co. has bonded the Jacklin property, in the Dragon range, paying \$10,000 down. The property is 25 miles north of Douglas.

GILA COUNTY.

In the reports of the Old Dominion M. Co., by D. McViechie and F. W. Hoar, Supt., Mr. McViechie reports exclusively on a shoot of high-grade ore extending from the seventh to the twelfth level. Supt. Hoar has included in his estimate all grades of ore in the mine, believing it to be necessary, to obtain the most economical results, that all grades of ore be extracted and treated. The reports indicate that, by future development, the sulphides developed will open into large ore bodies. The directors believe that the present system of smelting ore should be changed, and for this purpose tests are now being made. From April 2 to before June 30 the floating debt was reduced from \$359,178 to \$75,783. Since April 2 the company has purchased a briquetting plant, two additional boilers and a slag reverberatory furnace. The cost of these and other improvements will amount to over \$250,000. The production of fine copper for the last calendar year was 10,094,787, and it is at present continuing at the same rate. The cost of production was 12½ cents. For

the three months ended June 30 the cost was 10½ cents per pound laid down in New York. It is believed that the cost will be reduced to 8 cents through improvements at the mine. Freight charges during the year averaged 3½ cents per pound. The railroad companies promise to give a material reduction in freight charges. The company is now paying but 1½ commission on sales, instead of 2½, as formerly, when its copper was sold by the United Metals Selling Co. Mr. McViechie, in his report, says in part: "We found 55,559 tons of high-grade sulphide ore, with an average assay value of 11.8% copper, and 53,454 tons of high-grade oxidized ore, with an average assay value of 12.7% copper. We actually found 61,732 tons of sulphides and 59,393 tons of oxidized ore, but have discounted our measurement 10%, providing against pinches or horses of rock that might occur in the vein. Our total estimate, after deducting the 10%, is 109,013 tons, having a gross value (figuring copper at 11½ cents per pound) of \$3,135,986. The ore included in this estimate is found below the seventh level. We were unable to make any estimates of the ore above the seventh level, for the reason that in this portion of the mine many of the old stopes are inaccessible. While practically all the ore that is being treated in the smelter at this time is coming from this portion of the mine, it is almost impossible to form any estimate of what the mine above the seventh level will yield." The mine above the seventh level is expected to yield some 200,000 tons of ore. Continuing, he makes a number of suggestions relative to improvements at the mine. The smelter, in his opinion, is not what the company requires to make a close saving. While the high-grade ore reserves can be considered as fairly good, they should be increased as rapidly as possible. They should be brought up to 250,000 or 300,000 tons. He advises the erection of a new smelter and converting plant, believing that the best treatment for the ore would be to blast it. A new shaft should be constructed. The saving system of mining is recommended. In conclusion, Mr. McViechie states that he sees no reason why the mine should not be a paying proposition.

In his report Supt. Hoar says that it will soon be necessary to retimber the Interloper shaft from the eighth to the tenth level. He considers that if two blast furnaces were run this shaft would be taxed to its full capacity. Additional pumping facilities are needed and the rock house should be enlarged, while the tramming facilities should be greater from the rock house to the smelter. There should be electrical haulage.

On June 30, 1902, the company had on hand 4,401.245 pounds of matte. There were also about 7000 tons of flue dust, averaging about 5 7/8% copper. By the installation of a slag reverberatory furnace, the cost of which installed would be about \$11,500, he expects to reduce the copper in the slag .462%, if not better, thereby saving per month from one furnace about \$2500, or \$30,000 per year.

Fifteen miles from Globe the Yo Tambien mine, one of ten claims owned by the Pinto Creek M. & S. Co., St. Joseph, Mo., is opened by an incline shaft 330 feet, and by two levels intersecting the shaft at 100 and 230 feet. The ore is a high-grade sulphide in a quartz gangue. There is considerable peacock copper and glance scattered through it. It carries about \$3 in gold to the ton. Supt. Teale has the erection of a concentrator under consideration.

GRAHAM COUNTY.

At the property of the New England Copper Co., near Clifton, every drop of water has to be packed 10 miles on mule back, with a climb of 5000 feet.

MARICOPA COUNTY.

Wickenburg reports a new strike in the Oro Grande mine, or the return of an ore body that was missed.

The Wickenburg S. & R. Co. has bought the Black Jack mine, 10 miles east of Wickenburg, for \$4600.

MOHAVE COUNTY.

C. K. McCormick has succeeded in raising \$250,000 in Paris for the development and equipment of the Gold Road mines, near Kingman.

PINAL COUNTY.

The Copper Hill M. Co., with mines on the west side of the Canyada del Oro, 4 miles from Oracle, will install a leaching plant of 100 tons daily capacity, and expects to have the plant in operation by January 1st. They expect to build a traction engine road from the mine to Red Rock railroad station, distant 24 miles. They have 100,000 tons of 5% carbonate and silicate ore blocked out.

SANTA CRUZ COUNTY.

C. N. Thomas of the Buena Vista M. Co. is operating its copper mines 12 miles from Nogales. Forty men are developing the property.

YAVAPAI COUNTY.

H. G. Isenminger, manager J. I. C. M. & M. Co., will work the Portland group of four quartz claims, Big Bug, and put on machinery when workings are deep enough to justify.

The Courier hears that, at the 900-foot level in the Octave mine, Weaver district, a vein of ore 5 feet wide, which carries \$200 per ton gold, is exposed; 700 feet distant from this shaft is another one 1100 feet deep, in which is exposed a vein 8 feet wide, which carries \$26 gold per ton. So much water has been struck in the bottom of this 1100-foot shaft that more powerful pumps will have to be put in before the shaft can be sunk deeper. Water to run the quartz mill is being pumped from this shaft.

G. W. Hull of Jerome will run a tunnel through the mountain adjoining the United Verde properties—the tunnel site selected by the late J. R. Dillon of the Jerome C. Co., and which he ran into the hill over 1000 feet. The tunnel, when completed, will be 3600 feet in length, and at some points will be 1200 feet beneath the surface. It crosscuts the formation. Mr. Hull expects to cut four veins or ore bodies. He estimates the total cost of the tunnel at \$30,000. The tunnel will connect with the workings of the 1888 mine.

The G. A. Treadwell M. Co. is building an oil smelter at Mayer station for the Iron Queen mine, 2 miles away. A 9-mile pipe line—3 and 4 inches in diameter—will bring water from Crystal Springs to the smelter. It is completed to a point 1 mile from the smelter site. The smelter is of 100 tons capacity, and is built under patents issued to M. P. Boss, designed to turn out blister copper at one operation.

CALIFORNIA.

The California Debris Commission reports that forty-five permits for hydraulic mining were made during the year ending June 30, 1902. Nearly all were granted. The total number of applications since 1893 was 565, of which 445 were granted. The total amount of material mined during the year under permits is estimated at 836,500 cubic yards.

ALAMEDA COUNTY.

T. P. H. Whitelaw will build an iron rolling mill and steel works in East Oakland.

AMADOR COUNTY.

(Special Correspondence).—The Standard Electric Co. have installed five 3000 H. P. alternating current dynamos here. Water from the Blue lakes and other reservoirs is impounded above the plant and furnishes the power for water wheels, constructed from special designs by the Union Iron Works. The equipment is all of the S. K. C. system; 220 volts furnished by the dynamos is transformed to 40,000 volts at the plant by means of rotary transformers, oil being used at insulating material. This is carried 175 miles to San Jose, and may even be carried to San Francisco.

Electra, July 28.

At the Sargent mine, near Jackson, a contract to sink the shaft 300 feet has been let. Price, \$10 per foot, contractors to supply candles, fuse, powder.

F. B. Joyce, owner Defender mine, has returns from fifteen tons ore, \$1643 in gold, \$1.60 to the ton silver, a trace of copper, a smelter test. He is putting up a 10-stamp mill.

The Shenandoah Con. M. & M. Co. has levied an assessment of 2 cents per share, delinquent August 22.

CALAVERAS COUNTY.

The Neverthought mine, near Jesus Maria, is operated by the Samson Con. M. Co., which is running two tunnels; W. L. Huston Supt. With proper development it will prove a dividend payer.

The Mauna Bros. mine, Wet gulch, is under option to W. Hamilton. It shows ore that will average \$10 per ton.

The Ultimo M. Co. has levied an assessment of 20 cents per share, delinquent August 30.

KERN COUNTY.

Under date of July 26 an officer of the Yellow Aster M. & M. Co. writes: "We have made some changes in our board of directors, also in the management, and expect to continue working the mines and putting on new improvements. We are not offering it for sale, although numerous brokers are seemingly trying to make it appear so. Our present board of directors are C. A. Burcham, R. L. Burcham, C. H. Mooers, John Singleton and Charles Wier. We expect to resume the regular payment of dividends next month."

LASSEN COUNTY.

Under the vigorous ownership of Benjamin & Meredith of San Francisco the old Golden Eagle property at Hayden Hill is showing increased wealth and is being developed into a valuable property.

LOS ANGELES COUNTY.

The Union Con. M. Co., Los Angeles,

owning the old Howard refinery, has spent \$100,000 in fitting up an oil refinery with five 200-barrel stills for manufacturing light oils and asphaltum.

MARIPOSA COUNTY.

The Austin and Dolph mines at Whitlock have been bought by T. R. Lombard of Coronado, Cal., and A. M. Kitchen of Chicago. At the Austin mine fifteen men will be put on. On the Dolph property Nevils & Hannah have a contract for 110 feet of shaft and drifts. D. A. Conolly of San Francisco is Supt.

NEVADA COUNTY.

(Special Correspondence).—Water to the amount of over 400 gallons a minute has for some time been handled by hoisting at the Central shaft, North Star mine. As this was beyond the capacity of the hoist in addition to other necessary hoisting, pumps are being made at the company's machine shops according to designs made by Assistant Supt. Sherman. A Dodd concentrator is installed at the mine. It is hoped by this means to save much fine auriferous material that has been lost in the past. Only fifteen stamps are being run at present, owing to inability to make desired savings.

Grass Valley, July 29.

On July 28, in the Federal Circuit Court, San Francisco, was rendered a decision involving \$600,000 of mining property in Grass Valley and vicinity. The suits were those of the Pennsylvania M. & M. Co. vs. the Grass Valley Exploration Co. There were two actions tried jointly. The first was an action in trespass instituted August 6, 1900, by the Pennsylvania Co. to recover the value of the ore extracted by the Grass Valley Co. from certain underground workings alleged by the Pennsylvania Co. to be in and upon their vein or lode. The second was an action in ejectment begun Feb. 16, 1900, by the Grass Valley Co. to recover possession of the lode described in the first action and embraced within the Pennsylvania underground working. The mining ground controversy is located in Grass Valley. The Pennsylvania Co. claimed the right to carry on mining operations in which it is engaged, based its claim upon the allegation that all underground workings are made in the regular pursuit of their mining operations in developing and extracting ore from and beneath the lode which is continuous from its apex at the surface and within the boundary claims of the Pennsylvania Co. to the lowest workings in the mine. By reason of this claim they claimed that title to this particular vein was in the Pennsylvania Co. no matter where it led to. The questions presented for determination were: The existence and continuity of the vein or lode apexing within surface boundaries of the property owned by the Pennsylvania Co. Continuity of apex of such and in the direction necessary to embrace within extended end lines planes the vein in controversy. The continuity and persistence of such vein or lode on its dip or downward course from its apex to the lowest point of the vein or lode as developed or worked by either party and including the ore described in dispute. The Pennsylvania Co. claimed it had an apex vein at or near the surface and within the boundary of its own property going beneath the claim of the Grass Valley Co. This position was denied by the Grass Valley Co. who declared that its opponent never had such a vein that did not cross both sides of its (Grass Valley's) location. The court is of the opinion that the evidence established the existence of the vein or lode apexing within the surface boundaries of the Pennsylvania Co.'s claim and that there is a continuity of apex of the vein or lode lengthwise the claim to the extent and in the direction necessary to embrace within its extent any claim or vein or lode in controversy. "In my mind," said Judge Morrow, "a most conclusive fact is established of the continuity of the Pennsylvania vein, and that it follows to the lowest workings of the mine beneath the surface claim of the Grass Valley Co. The Pennsylvania Co. has established its right to all ore beds and sections in the mine in controversy."

The case involves the W. Y. O. D. mine and several other large properties in the Grass Valley district. The opinion had been looked for by mining men for many months and the result will be immediate enlargement of operations by the Pennsylvania Co. By agreement the company receiving the decision is given the right to mine the disputed ground on the decision of the court, pending an appeal. The first case was referred to a referee or commissioner to be appointed by the court to take testimony and report as to the damage sustained by the Pennsylvania Co. by reason of the acts of the Grass Valley Co., and such further proceedings will thereupon be had as provided in the stipulation of April 17, 1901.

The Red Cross group, bought in March, is to be developed. Manager F. Enzens-

perger says a mill of adequate capacity will be erected. The Western Exploration Co. has with it in this enterprise C. I. Roder, manager Annie Laurie Co. Gold M. Co., Utah, and J. A. Brent, San Francisco. W. F. Snyder president, C. J. Roder vice-president, C. Ellingwood secretary and treasurer. Manager Enzensperger will make his headquarters at Nevada City.

The new compressor is in operation at the Gray Eagle mine, near Nevada City. A 10-stamp mill is on the ground and will be erected.

PLACER COUNTY.

(Special Correspondence).—For the use of the compressed air locomotive at the Red Point gravel mine, air is being compressed to 840 pounds by the three-stage compressor located below the mine. Almost the entire power for the compressor is derived from the mine water. Of the 70 cubic feet per minute coming from the mine, a part is used to wash the gravels, the remainder, in addition to running two ventilating blowers, runs the water wheel for the compressor.

Damascus, July 30.

G. W. Sackett is lessee Boston-South Dakota mine, Michigan Bluff.

The California mine at Shady Run employs thirty men.

The Summit mine, near Towle, reports fine prospects.

New machinery will be put in the Peckham Hill mine, near Spring Garden. The Bradley tunnel, at Black canyon, is in 100 feet.

PLUMAS COUNTY.

A. A. Osborn, treasurer Austrian S. & D. Co., has been examining mines at Genesee Valley and other points on the Plumas copper belt. He says a majority of the directors of his company were in favor of erecting a 40-ton smelter, but no official action has been taken.

The Plumas M. & S. Co. talk of a 10-stamp quartz mill on its group of mines in Genesee Valley.

SHASTA COUNTY.

The Unity Dredging Co. will dredge 300 acres on Dry creek, 12 miles southeast of Redding, and 2 miles from the Heintz property near Horsetown. L. Scrutton is manager.

There is a change in the site of the 125-ton smelter which the Great Western G. Co. is to build at Copley. The railroad's surveyors are running lines for the siding to the new site.

Assistant Supt. Anchor of the Bully Hill M. & S. Co. is developing a 30-foot vein that runs 20% copper, with silver and gold.

Bully Hill mines are 28 miles from Redding. A smelter is located near the mine. De Lamar township adjoins the smelter site on the east. South of De Lamar and south of the smelter is Sallee township. De Lamar and Sallee are separated by a gulch a few rods in width and virtually form one community. The residents of both places and the Bully Hill miners receive their mail at Winthrop postoffice, located in De Lamar. Copper City is 2½ miles south of De Lamar. The name of its postoffice is Ydalpomp.

SISKIYOU COUNTY.

(Special Correspondence).—In the Salmon river country the Yreka M. & M. Co. (Ball mine) has suspended work in Mountain Laurel and Golden Eagle claims; 6800 tons of ore were crushed from these two mines during the season, the average value about \$8 per ton; 150 tons of sulphurets were produced, which are being shipped to Selby for treatment.

The next season's run will be taken from the Ohio, Flora Blanche and Alda claims. A bucket tram will be put in to transport ore from these claims to the mill. The timbers are already cut and on the ground. The work of putting up the tram commences Aug. 10.

The Salmon River Co. have suspended work on the Myers claim, below Sawyer's Bar. Two giants and one elevator were used successfully and the company realized well from the season's cleanup. One more season's run can be made from this claim. The company are contemplating a move to Summerville on the south fork of Salmon river by the end of next season. It will be necessary to construct 8 miles of flume at a cost of about \$50,000, to carry sufficient water from the south fork to Summerville.

The Gold Run mine at Gilta is running full blast. Ten stamps are crushing ore steadily. The mine is so well opened up that only six miners are needed to keep the mill going. The ore is of a good grade and the property is paying well.

The King Solomon mine, near Cecilville, is running full handed. Six stamps and a Huntington mill are crushing the ore from the mine. Twenty-three men are employed at the mine and six at the mill.

Rollin, July 21.

Spengler Bros. have shut down in their claim, mouth of Humbug creek, water

very low. When the winter storms commence ground sluicing will be resumed.

Golden Quartz ledge, near Indian creek, owned by A. C. Brokaw & Co., will have a new steam hoist.

TRINITY COUNTY.

The Searchlight says there is a mine on Union creek, the ore from which is so rich that the miners are compelled to wash their hands and brush their clothes into a gold pan. The ore is a blue talc. The property is owned by Mr. Bill of San Francisco.

The Trinity County G. M. Co., in which Sweeney & Clendenning of Spokane, Wash., are interested, will have the new stamp mill in operation next month. Seventy-five men are at work. The mine is 20 miles from Dedrick—70 miles from a railroad. The nearest point is Redding.

At the Dorleska mine pumping and hoisting has been resumed.

Gulick & Sons are working the Blue Lead, Iowa and other claims. Mr. Payne of Trinity Center has bought the Russell & Maker claim, south of the Yellow Rose, and is sinking a shaft on the property.

At the junction of Union and Coffee creeks, the Nash hydraulic mine is running full handed on a bank of gravel. On Lower Coffee creek, Burner & Sons are taking out ore to be worked by the cyanide process by the Golden Jubilee M. & M. Co.—The Golden Jubilee is running; the mill and cyanide plants are being worked to full capacity.

TUOLUMNE COUNTY.

Near Columbia, the Keltz mine and mill are in operation. Twenty men are employed at the Mountain Lily mine. The mill is running in the daytime.

Carters New Era reports five houses being built at the Shawmut mine and 100 stamps dropping.

T. F. McAvoy of Alameda and A. White of Vallejo now own the Hardtack mine. The latter recently carried out the bond taken from Sears & Summers for one-half interest; price \$10,000. Both owners have deeded their property to the Hardtack M. Co.

The Msjor's claim, near Blanket creek, has been bonded to L. G. Harrison for \$13,000—\$3000 down.

In the Mt. Jefferson mine, near Groveland, the shoot of ore has widened out to 20 inches 85 feet below the 300-foot level. Free-milling ore runs to \$286.40 and sulphurets \$273 to the ton, making over \$500. The ledge is over 30 feet wide, averaging \$8 a ton.

Supt. Smith of the Sunnyside is working seventeen men.

The Confidence mine started its first machine drill last week.

COLORADO.

BOULDER COUNTY.

The new Wall Street mill will begin next month, to be run entirely on low-grade ore—\$3 per ton.

Mrs. T. Haig of Topeka, Kan., has bought the Puzzler mine and twelve claims adjoining it, near Puzzler, for \$10,000. One tunnel will be run this summer which will cut all the claims.

CHAFFEE COUNTY.

The Florence-Elmo M. Co., at Buena Vista, will be further developed.

CLEAR CREEK COUNTY.

Idaho Springs reports a deal of great importance. The International M. Co. has bought the Weldon group and the Fairmount mine \$60,000 and \$80,000 respectively having been paid. The new owners will group the two properties and develop them. The International M. Co. is a Boston corporation, head offices in Waterbury, Vt., the home of the president, G. E. Moody. The new company has a right of way through the Mixsell tunnel.

Near Silver Plume, the Corry City group, now owned by a Baltimore company, under the management of C. D. Desch, is under examination by a Philadelphia company. In case of purchase they propose to drive a long tunnel to cut these lodes 1000 feet deeper; also to erect a large mill.

The Terrible group has resumed operations. The tunnel is being retimbered, old buildings repaired, and when that work is completed a plant of machinery will be installed. The electric drills at the Scott tunnel are at work. A 12 H. P. oil engine drives the dynamo that generates the electric current. A suction fan removes the smoke and gas from the tunnel after shooting.

The Republic Con. M. Co. has started work on the Commonwealth mine, at Dumont, through a crosscut tunnel to connect with the bottom of the old shaft and greatly facilitate the operation of the mine.

Idaho Springs reports the probable consolidation of the John Owen M. & M. Co. and the Gem Extension, W. E. Renshaw of the Gem property to be manager of the new company.

CUSTER COUNTY.

The Custer M. & R. Co. has a bond and lease on the Maverick mine, between Custer City and Rosita. Ore has been uncovered in the Maverick which runs \$257 in silver. Considerable money will be spent in improving the property.

The Bassick mine is enlarging the capacity of its mill from 75 to 125 tons a day; rollers and crushers going in at the new deep shaft, where the ore is delivered and crushed and then conveyed by water force in sluice boxes to the mill, located 500 feet distant; this method of transmitting the ore is used for the first time in that part of the State. The main shaft is down 1580 feet and will be put to 1680 feet, where new levels will be run out and considerable development work done to explore the big ore chimneys of this mine at that depth.

The Terrible mine, 15 miles northeast of Silver Cliff, has been leased by Gray & Baker, who are making a concentrate of the cerussite or crystalline lead ore which abounds on that property. When the concentrate is reduced to a litharge by furnaces at the mine it sells at \$120 a ton f. o. b. in car lots at Florence. This litharge vulcanizes 20% more rubber than ordinary litharge.

On the Hector a body of cyaniding ore has been uncovered at a depth of 200 feet.

The Bull Domingo, near Silver Cliff, has been unwatered to a depth of 950 feet by the Neptune Co.

DOLORES COUNTY.

(Special Correspondence).—The Emma G. M. Co., at Dutton, have a 125-ton mill and have in use a ball mill, eighteen concentrators, a 100 H. P. marine boiler and 175 H. P. duplex engine. They are doing the work through four tunnels and have done about 6000 feet of development work. They employ eighty men; Richard Keller is manager.

The Mt. Gorham M. Co. is operating a 10-stamp mill, employing twenty-five men.

Development work is being pushed on the America group, B. & M. and Free Coinage mine. The value of the ores in the district averages about 65% gold, about 35% silver and will concentrate about twenty tons into one.

Rico, July 24.

EL PASO COUNTY.

A cyanide mill, to treat low-grade ores from the Cripple Creek district, is to be erected at Colorado City, where R. M. Shearer represents the company.

GILPIN COUNTY.

The Calumet G. M. Co., Russell Gulch, has closed down indefinitely. Central City, July 27.

During the third week of last month the shipments of smelting and crude ores, tailings and concentrates from the Black Hawk depot to the Denver and Golden smelters and outside points of treatment were 115 cars—2230 tons. For the first three weeks of that month the shipments were 313 cars—6260 tons.

GUNNISON COUNTY.

The Good Hope M. & R. Co. are installing their new 100 H. P. boiler. They intend sinking their shaft 200 feet deeper. Vulcan, July 27.

HINSDALE COUNTY.

(Special Correspondence).—The Henson Lead Co., Lake City, have a power plant and pipe line similar to the Red Rover M. Co. They are using electric drills in their mine and are excavating for a 100-ton concentrating mill to be completed before winter.

The Hanna property at Capital City is starting its 100-ton mill and will build an aerial tramway about three-fourths of a mile in length.

A great deal of prospecting and development work is going on up Henson creek, near Lake City. There are more permanent improvements now going on around Lake City than for the past five years.

The Auric M. Co., operating the Ute & Ulay mine at Lake City, are going to sink a deep shaft to cut the mine at a greater depth than at which it has ever been worked. They expect to erect a new mill at once. The ore is lead concentrates. They are shipping fifteen tons of concentrates per day, employing about 100 men. J. J. Duffey is superintendent of mine and J. Bamhrough superintendent of mill.

The Hidden Treasure M. & T. Co., Lake City, have closed down temporarily for repairs. They expect to be running full handed by August 15th. They employ 100 men when operating and expect to drive a crosscut tunnel 4000 feet in length.

The Tohasco M. & M. Co., Lake City, are building an aerial tramway and a 100-ton concentrating and pneumatic cyanide mill.

Lake City, July 25.

S. D. Nicholson, manager Auric M. Co., operating the Ute & Ulay mine on Henson creek, says he will sink a new shaft 1200 feet. It will be 4½x15 feet in the

clear. The company will also build a new mill.

The Dupre Co. has opened a vein in the Isolda claim, Burrows park; pay streak, 20 inches wide, runs sixty ounces gold.

LAKE COUNTY.

Near Leadville the Fanchon mine is hoisting three tons of ore daily sufficient to pay expenses of development work. Ore runs fifty to seventy ounces in silver to the ton; net profits above smelting charges about \$25 per ton.

Supt. Henley of the Elkton says the pumping being done in the eighth level is costing about \$7500 a month and is making little impression on the water situation generally. The Elkton Co. think other Leadville mines should come in and share the cost of pumping. An effort will be made in this direction, after which, if co-operation is not secured, the Elkton will be forced to shut down its eighth level.

Jas. Shinn, manager Stormy Petrel M. Co., will resume work on the property near Leadville. The ore is largely an oxidized lead.

Manager C. T. Carnahan of the Resurrection M. Co. expects to have the new concentrating mill finished Nov. 15th. He thinks that, for separating iron and zinc, the Wetherell process of magnetic treatment meets all requirements of the situation.

The Colorado Fuel & Iron Co. has bought 2000 acres, Sugar Loaf reservoir, in Lake Park, will build a reservoir, a dam 1000 feet long, 40 feet high, capacity of 1000 million cubic feet water.

At Leadville, the A. Y. & Minnie has 250 light electric motor for its new mill and mine. The company expects to start up next week.

F. Bergber of the Weldon mine has organized a company to run a tunnel into Sugar Loaf mountain, tapping the veins at a depth of 900 feet below the Dinero vein. The estimated cost of the tunnel is \$35,000.

LA PLATA COUNTY.

(Special Correspondence).—The Ruby King mine, in the Oro Fino district, is doing a large amount of development work on their properties. A good deal of work is also being done on the Buffalo. Some rich ore is being sent direct to the smelters from this district.

Durango, July 24.

OURAY COUNTY.

(Special Correspondence).—The Atlas mine, in the Sneffels district, under bond and lease, is taking out considerable ore and doing development work. They have about 1300 feet of tunnel work; have already cut the parallel vein, and have a drift 160 feet on the Atlas vein crosscut; have drifted 1000 feet on the vein and struck some high-grade ore.

The Camp Bird Extension M. Co. is running a drift on the Monument vein, and, now in 1250 feet, expect to cut the Camp Bird vein 800 feet farther. Work is all being done under contract. The same company is also opening up the Hoosier Girl vein near the angle station of the Camp Bird tramway. Some very rich silver ore was shipped out of this mine in the early days.

The Morning Star, in Poughkeepsie gulch, across from the Gold Klog, which has been worked in a small way for the last twenty years, is being operated by the owner, C. Anderson, and shows a streak of high-grade ore, carrying gold and lead. This property adjoins the Alaska, owned by the Tahor estate, and in the early days shipped 3000 ounces of silver ore.

The Home Pyritic Smelting Co. of Ouray expect to commence purchasing ore Aug. 10 and to start the smelter by Aug. 15. They are putting the smelter in shape for running, as well as erecting some new houses.

The Saratoga smelter, at Ironton, is preparing to start work. The directors are here from the East; they intend building a railroad from Red Mountain to the smelter, 3 miles. They hope to have the smelter running in thirty days.

Loughlin & Hobson of Ouray have a lease on the Old Lout mine, in Poughkeepsie gulch, and intend to start shipping ore.

Ouray, July 22.

(Special Correspondence).—The Revenue Tunnel M. Co. at Sneffels expect to have their cyanide mill in operation in one month. They have about 150 men employed and are taking out three cars of ore per day.

Sneffels, July 26.

SAGUACHE COUNTY.

At Florence the Steel Canyon M. & M. Co. has been organized to work mining property near Orient and will erect a 40-ton matting smelter.

(Special Correspondence).—There is considerable work being done in the vicinity of Mineral Point, owing perhaps to the discovery of rich ore in Burro Park. This

is an old district, having been prospected in the early '70s; but, owing to the high transportation charges and short season, work was practically abandoned. Work was resumed last month on the Early Bird property, between Animas Forks and Mineral Point, by Thistle & Neely of Ouray, which has produced eleven carloads of ore from a drift 240 feet on the vein, without stoping. This ore gave net smelter returns of \$6500, or an average of \$60 per ton net to the owner, O. S. Olsen, who became discouraged when the values played out in the last 10 feet of his work, and he leased the property to Thistle & Neely, who carried the drift only 5 feet farther and opened up a rich ore shoot. The vein at this point is 3 feet wide; ore shoot, 18 inches. The average value of the pay streak shows 4.2 ounces gold, 256 ounces silver and 6% copper. The finding of this rich ore has stimulated the owners of other properties in the vicinity and a good deal of work is going on there. Just across from the Early Bird, Davis & Downer are working the Mammoth mine under lease and are taking out some good ore.

Silverton, July 21.

(Special Correspondence).—The Tomboy mine mill is running steadily. The company is making progress with their new mill, baving the timbers and framework completed and inclosing begun. All the material for the mill has to be packed upon mules and wagons. They have started work on the new wagon road from Telluride to the Tomboy mines, which will be a great improvement over the present trail when completed. It will be several months before the road will be ready for use.

The Smuggler-Union M. Co.'s mills are now being operated by water power from Bridal Veil Falls utilizing this stream under a head of 1218 feet, developing power sufficient for the entire needs of the property—about 700 H. P. They are operating 140 stamps in two mills—one mill sixty and the other eighty stamps—and a cyanide plant, capacity 500 tons per day, and are milling 550 tons per day. There are about 400 men employed at the mine.

The Ophir Con. Mines Co., at Ophir, is probably the only mill in the State of Colorado driven direct from motors to cam shaft without line or countershaft. They now have twenty stamps and are putting in thirty more. They are handling 100 tons of ore daily; when the new mill is completed they will handle 175 tons. W. S. Buckley states they are handling a carload of concentrates daily. Ores average about \$50 per ton. They have a new compressor plant and are running all of their drifts with machine drills. As soon as they get the mill completed and running, it is the intention of Manager Buckley to start building another 50-stamp mill in addition to the one they now have, making a 100-ton mill.

Telluride, July 28.

Silverton reports that the International Reduction Co., as represented by C. H. Gage of Denver and J. F. Cullen of Pittsburgh, Pa., has bought the Galtby Boy group of claims for \$40,000. The new owners say they will erect a plant suitable for the reduction of the ores.

SUMMIT COUNTY.

The American Gold Dredging Co., in Swan valley, is operating the dredger and sluicing at the mouth of Galena gulch.

The Gold Pan Placer Co. is pushing its pit for the bedrock. A rotary pump has been placed in the pit 65 feet below the river level to handle the heavy inflow of water. The 3-foot wide rubber belt conveyor to remove the tailings from the double elevated flume, in which the gold gravel is washed, is about finished, and will provide dumping facilities.

A gold nugget is reported found by Manager Dyar of the American G. D. Co., worth \$499.82. The same placer produced a nugget last month worth \$128. The Cashier mine, near Breckenridge, has decided to put in twenty more stamps, doubling the capacity of the mill. T. L. Wood, of Denver, is manager.

TELLER COUNTY.

The Central Consolidated Co., Cripple Creek, proposes putting in an entire new and larger plant of hoisting machinery on its Happy Year claim, on Raven hill.

The Cripple Creek M. Co., lessee of the Hull City Placer, has resumed sinking from the 1100 foot station of the main shaft.

The Cripple Creek Times says: "Tired of pumping water of the district and bearing the entire expense, the board of directors of the Elkton Consolidated Co. has decided to close the eighth level of the mine and keep it closed. The level will be closed just as soon as they are able to get out the ore that is already broken there. The board of directors would be willing to keep the level open and continue pumping if the other mines would be agreeable to sharing the heavy expense of running the pumps. During the

past year or more the Elkton has been drafting the entire district of the water. They have tired of it and do not intend doing so longer."

Near Victor \$1,000,000 damages is asked by the Morning Glory G. M. Co. against the Mary McKinney M. Co., and a temporary injunction restraining the latter from further work on the Alleen lode claim is prayed for. The Alleen lode and the Republic lode are contiguous mining claims owned by the respective companies in the Cripple Creek mining district. The Morning Glory Co. claims that the defendant company entered upon the Alleen claim by "force of arms" on January 1, 1899; that it has since retained possession of the property and did sell and convert to its own use large amounts of valuable gold and silver-bearing ores, to the amount and extent of not less than \$1,000,000. Warren Woods is president of the Morning Glory Co.

IDAHO.

ADA COUNTY.

The New Century G. M. Co. has made its last payment on the Sunbeam and Sunshine claims, Neal district, 20 miles from Boise—the completion of the purchase price of \$16,000. The company is composed of New York men and is represented in Boise by A. C. Fralik and W. L. Grose, who have conducted the development work on the property since the purchase.

IDAHO COUNTY.

Grangeville reports \$1600 gold as the product of the first twelve days' run of the Crackerjack mill; \$20 a ton is lost in the sluices, which can not be taken up on the plates. The sluices can be cyanided for \$2 a ton, and the company will put in a cyanide plant. The concentrates carry \$5 a ton. A crusher is to be added.

Warren is reported lively. There are twenty-five men working in the Silver King mine, twenty in the Rescue and sixteen in the Little Ben property.

General Manager F. M. Kirkpatrick of the Thunder Mountain Con. G. M. Co. says he will put a 5-stamp mill on the company's property, Thunder Mountain district, adjoining the Belle of Thunder Mountain Co.

At Weiser W. J. Finn, from Marshall Lake, reports that the owners of the Jewel group have a stamp mill which is cleaning up \$30 per ton. Marshall Lake is 90 miles from Council, the terminus of the Pacific & Idaho Northern Railroad. The ore is free milling.

SHOSHONE COUNTY.

C. Sweeney is locally credited in Wallace with having bought the Wyoming mine and a controlling interest in the Black Hawk. The price named is \$225,000.

The Hercules M. Co., at Wallace, propose putting in machinery.

At Mullan, A. M. Strode, manager Reindeer mine, says he has a 2-foot vein of 20% copper ore.

D. A. Hyman, president Frisco Con. M. Co., expects work will start again September 1 on the Frisco at Gem.

The Intermountain Mines Co. has incorporated at Spokane, Wash., to operate near Wallace.

Before the assessment board Manager Ehrenberg of the Helena-Frisco testified that the Helena-Frisco lost 16 cents per ton on all its output in 1900. Manager Burch stated that 43.3% of the ore taken from the Bunker Hill & Sullivan was taken from the Stewiander claim, an unpatented property not assessable and that in a great measure accounted for the \$21,000 a month paid in dividends and the capitalization of the property. Mr. Doherty, on behalf of the Cœur d'Alene M. Co., a placer property on the Murray side, declared under oath that the \$15,000 in gold extracted from that property last year cost the company \$16,000 to produce. The board reduced the assessment \$25,000.

MICHIGAN.

HOUGHTON COUNTY.

In his report of the Calumet & Hecla for the fiscal year ended April 30, President A. Agassiz says: "During the past year we produced mineral equal to 42,462 tons of refined copper, as against 37,932 tons last year. (This small production was due to the fire at the mine of that year.) Our product in refined copper was 39,982 tons. For the previous year our product in refined copper was 36,326 tons. The price of copper has varied from 16½ to 11 cents per pound, and is now about 12½ cents. During no year, perhaps, in the history of the mine has so large an equipment been added by the company as during the past year. At the Lake Linden smelting works five large-size furnaces have been rebuilt. This change will result in considerable economy in smelting. At the Buffalo smelting works the new electrolytic plant has been completed and a new wharf has been built. We have made some successful experiments with a

full-sized model of a Kimberley hoist. It is proposed to install such a hoist at the Red Jacket shaft during the coming year. Interesting experiments are making with our waste sands, which, it is hoped, may lead to a marked saving of the wastes of our mills."

MONTANA.

GRANITE COUNTY.

The Granito-Bimetallic Con. M. Co. shipped twenty-six bars of silver bullion from Phillipsburg last week.

MADISON COUNTY.

W. F. Odin of Sheridan is building a 5-stamp mill to treat the product of his mine.

F. Wright, Supt. Montana M. Co., operating a group of mines at the head of Wisconsin creek, near Virginia City, has a mill which treats fifteen tons of ore every twenty-four hours.

MEACHER COUNTY.

The copper mine near Copperopolis is unwatered and sinking is progressing.

MISSOULA COUNTY.

At Saltese the Monitor is employing thirty men. Howard Walsh owner, J. Cooley foreman.

The Tarbox has hoisting machinery capable of sinking 500 feet. The vein has a width of 18 feet.

Ten men are at work on the Garrison claim.

PARK COUNTY.

Application has been made by stockholders of the Bear Gulch M. Co. asking that a receiver be appointed to take charge of the company's property at Jardine.

SILVER BOW COUNTY.

F. A. Heinze's mines in Butte are reported to be at present producing copper at the rate of 3,550,000 pounds a month, divided between his three principal properties as follows: Rarus, 1,500,000 pounds; Minnie Healey, 1,300,000; Corra, 750,000.

NEVADA.

ESMERALDA COUNTY.

Men will develop the property of the Con. Esmeralda M. Co., Hawthorne district, under the superintendency of R. K. Colcord.

LINCOLN COUNTY.

During the month the Quartette Co. milled 800 tons of ore, which netted \$23 per ton. The total cost of mining, transportation over 16 miles of railroad and milling was \$3.60 per ton. The railroad is now making two trips a day and hauling about seventy tons daily to the mill.

NYE COUNTY.

At the mines in and around Tonopah are ten gas engines and hoists and two steam engines varying from 10 to 32 H. P. There are ten whirls in operation.

Tonopah reports that the recent demand for men is supplied. "Stages are crowded and the town is full of idle men."

Messrs. Leonard & Taylor of San Francisco say they will put in a plant to treat the ores of Tonopah that will not stand the long wagon and railroad hauls to market. They have contracts for 20,000 tons of ore as a starter. Over 250 teams are now employed in the freighting business between Tonopah and the railroad. The stage line is running three coaches daily.

C. Mau, one of the original locators of the Pactolus mines, 35 miles east of Luning, says supplies are expensive and water cannot be obtained for \$5 a barrel. The ore is in stringers pitching into a porphyry dike. The country has been staked for miles around.

STOREY COUNTY.

At Virginia wiring the Caledonia for electric power is completed and motors placed for running a blower on the 1100 and 1000 levels, the power for which will be carried down the shaft in a six-ton lead cable. The 1100 level will be the distributing point from which wires will be run to the various workings in that vicinity for light, etc. The new system will dispense with the air pipe in the shaft.

WASHOE COUNTY.

H. D. Ramsey has gold-bearing ore at a depth of 100 feet in the Tally-Ho mine, Wedekind district, that assays \$300 per ton. A new postoffice has been established at Wedekind.

WHITE PINE COUNTY.

The Bell Mare M. & S. Co. and the Nevada Copper Co. have consolidated as the Nevada Belle C. M. & S. Co. The new company owns 500 acres and is supplied with machinery, surface improvements and a 50-ton copper matte smelter, the latter on the property of the Nevada Copper Co. The new plan of development contemplates running a 1000 foot tunnel to the Copper King ledge, the principal copper deposit on the Bell Mare. C. W. Sweltzer of Reno is president.

NEW MEXICO.

The Abbey M. Co. of Pittsburgh is operating at Abbey, Socorro county; Upham, Sierra county, and Rincon, Dona Ana county. The Abbey group is 25 miles north of Magdalena. The Washington group is in Sierra county, 10 miles from Upham station. There are four claims in this group. The vein is from 100 to 150 feet in width, capped with iron, through which copper stringers are protruding, assaying 20%. The Manganese group is in Dona Ana county, 1 mile from Rincon. There are twenty-eight claims, stretching for 8 miles along a continuous vein, apparently making it the largest manganese property in the world.

OREGON.

BAKER COUNTY.

Manager J. A. Hilliker of the Western Union M. & D. Co., will drive on the Blaine and Monte Cristo, near Sumpter.

Near Sumpter, the Cougar management has improved methods of treating the ores—finer crushing, previous to cyaniding, being the principal change.

It is locally stated that a large stamp mill is to be put on the Friday group, near Baker City, by Manager F. E. Wilson.

The Psyche mine, Greenhorn district, owned by J. Fawcett, will have a 10-stamp mill. The tunnel is in 250 feet and will be continued 600 feet.

L. V. Swiggett of Sumpter has sold the Orleans quartz mine to E. H. Emery of Baker City.

The Valley Queen G. M. Co. has incorporated at Sumpter by T. Gray, C. S. Warren and C. H. McColloch.

From Baker City Z. C. Houser of the Standard mine will send five tons of copper and gold ore that will average \$100 to the ton to Germany for permanent exhibit of the mineral wealth of eastern Oregon.

Placer mining on the Snake river is reported profitable in some places this season. On Sturgill bar, owned by Reed, Bobinette & Co., the gold is very coarse. The clean-up for the season is estimated at \$10,000.

Operations are to be resumed on the Diadem mine, near Sumpter.

GRANT COUNTY.

The first carload of concentrates from the Badger mine, Susanville, has been sent to the smelter.

JOSEPHINE COUNTY.

Operations at the Oregon Bonanza, Williams creek, have been suspended. Supt. Rogers is in San Francisco to consult with the company.

Machinery at the Granite Hill mines, Louse Creek district, is in operation. The properties are being developed. The quartz is giving returns of \$26 per ton. The Red Jacket mine is opened to a depth of 300 feet. The Granite Hill M. Co. owns 500 acres of mineral land; 240 acres of this is placer land. The company operates a large hydraulic mine. The company expects to put in an extensive plant and work the group of mines as one big quartz property.

MALHEUR COUNTY.

Minnesota people have bought the porphyry dyke near Malheur City and will put in a 20-stamp mill. The ground prospects about \$3 per ton.

SOUTH DAKOTA.

CUSTER COUNTY.

The North Star mine, at Custer, is down 350 feet; a plant will be built to treat the ore.

LAWRENCE COUNTY.

The Kildonan chlorination mill at Pluma will be converted into a combination smelter, cyanide and chlorination mill.

J. Madill, former Supt. American M. Co., is now working mines of his own at Ragged Top.

PENNINGTON COUNTY.

The Horseshoe Co. is negotiating for the National smelter at Rapid City.

UTAH.

BEAVER COUNTY.

The Majestic Co.'s smelter will probably be located at Tadpole Springs, 3 miles south of Milford.

IRON COUNTY.

P. L. Kimberley and F. H. Buhl of Sharon, Pa., have bought the iron deposits on Iron mountain from Walker Bros., Cullen & Campbell for \$225,000.

JUAB COUNTY.

The Orient M. Co., West Tintic, say that, while tests show the cyanide process would make possible 92% gold extraction, they will not build a mill till 60,000 tons ore are in sight. The ore averages \$8 per ton.

SUMMIT COUNTY.

The Park City Record reports regarding the Daly West that the last of the

wreckage from the explosion is cleared away and the property again working in its customary way, putting out the usual tonnage. The noxious gases are all out of the mine and ore is issuing from the tunnel mouth in the usual quantities. No material damage was done to the mine proper by the explosion.

The California mine has started work again. Foreman Getsch has twenty men stopping and running a raise from the lower tunnel to intermediate workings. Extensive work is mapped out.

The immediate enlargement of the Anchor concentrator at Park City will be to a capacity that will enable it to treat 300 tons daily.

TOOELE COUNTY.

The Black Diamond property at Stockton is to be developed under the management of J. Dederichs. Samples of galena have yielded 60% lead, twenty-five ounces of silver and \$3 gold to the ton.

The Ensign G. M. & M. Co. has resumed development work on its Pine Canyon properties.

A fire in the shaft house of the Honerine mine at Stockton, July 28, did damage to the estimated amount of \$50,000, destroying the shaft house, boiler house, four 100 H. P. engines and timbers in the shaft to a depth of nearly 100 feet. The origin of the fire is not known. The machinery destroyed had not been running for several weeks, the plant having been shut down prior to beginning work on the tunnel. The property destroyed was fully covered by insurance and will be immediately replaced.

WASHINGTON COUNTY.

Manager T. Ferguson at Silver Reef will place a cyanide plant to leach the tailings. He has a lease on the Barbee, Christie and Leeds tailings dumps—400,000 tons. The mill will be of 100 tons daily capacity, to be in operation Oct. 1st.

WASHINGTON.

FERRY COUNTY.

(Special Correspondence)—Rich ore is being taken from the granite belt, south of the Agency. The Apache people are sacking ore for shipment to the smelter. It is brittle silver ore charged with iron pyrites, which latter carries gold values. A test of the shipment being sacked gave \$1400 silver and \$200 gold. East, and on the same vein, the Double Header and Little Chief show the same ore—brittle and ruby silver, with the same yellow iron sulphide rich in gold. Several other claims in the same belt, notably the Combination and Hattie D., are taking out the same class of ore. The new river steamer, the Chelan, will soon be making regular trips from Wenatchee, and preparations are being made to take advantage of the new transportation via the Great Northern road from Wenatchee to the coast smelters.

Lakeside, July 21.

From Republic four cars of ore were shipped to the Granhy smelter last week from the Lone Pine-Surprise. Supt. Creasor has not yet received smelter samples.—The California mine has shipped seventeen cars of ore to the smelter at Nelson.—The Morning Glory is driving an adit tunnel.

LINCOLN COUNTY.

Near Davenport, Manager H. J. Davis of the Turk M. & M. Co. says it is the company's intention to build a smelter to treat the ore at the mine. The smelter will be built on Cedar creek, 1 mile below the Turk mine.

WYOMING.

CARBON COUNTY.

At Grand Encampment the North American Copper Co.'s option on the Ferris-Haggerty mine will expire Aug. 15.

UINTA COUNTY.

At Cheyenne the Edison Electric Co. is incorporated to establish a power and light plant in the vicinity of Evanston, in the Uinta oil field, to furnish light and power to the towns that are expected to spring into existence as a result of the predicted oil boom there. A Cooke has charge.

FOREIGN.

BRITISH COLUMBIA.

E. G. Prior, Minister of Mines of the Province of British Columbia, in his annual report for the year ending December 31, 1901, shows that the gold production of the Province—including both placer and lode gold—for the past year was of value of \$5,318,703, the greatest gold production British Columbia has ever made. This production is derived from placer mining, including ordinary placer work, hydraulicking and dredging, and from lode mining.

Placer mining is of necessity dependent on the weather, says the report, and is as variable in this Province as that commodity, but in lode gold mining, as the

mines develop, the production becomes as regular as the output of a manufacturing business, and it is to lode mining that the Province is indebted for its ever increasing gold production. In 1901 the lode mines of the Province produced \$4,348,603 in value of gold. The increase is due to the development of the Boundary district. The increased tonnage of the Rossland and Nelson districts has also had its effect. Approximately this gold has been derived from: Direct smelting of copper-gold ores \$3,474,738, combined amalgamation and concentration \$873,865, total \$4,348,603. It may be said that no absolutely free milling gold property is working in the Province. They all carry sufficient values in sulphides to necessitate the saving of such.

The total amount of silver production in 1901 was 5,151,333 ounces, valued at \$2,884,745. Silver is derived from silver-lead ores and from copper ores carrying silver, with a small percentage of dry silver ores. In 1900 approximately 90% of the silver produced was derived from silver-lead ores, probably including most of the dry ores, as they were chiefly smelted together and are impossible to separate in the statistics. This year there has been a falling off in the production of lead ores, and a consequent diminution of the silver production, which has, however, been more than offset by the greatly increased tonnage of the copper-silver ores.

As near as can be estimated, the copper-silver ores have this year produced 301% of the silver output. The production of dry ores, although proportionately small, has increased.

The production of lead the past year was 51,582,906 pounds, worth \$2,002,733, a decrease in value of \$689,154, or about 25% as compared with the production of 1900, but in 1900 there was a phenomenal increase over 1899 of 206%. The figures show, therefore, that the lead production in 1901, although showing a decrease as compared with 1900, shows an increase over 1898 of 86% and over 1899 of 128%, and is still 25% higher than the highest production of any year prior to 1900. The cause of the decrease is not attributable to the mines themselves, but to the condition of the market for lead ores—too large a question to go into here—which has temporarily rendered it unprofitable to mine large bodies of galena very low in silver. Reference is here made particularly to the lead ores of East Kootenay. The Slocan district has not been so seriously affected by the low price obtained for lead ores, as the ores of that section carry much higher silver values, which has enabled them to be mined and marketed at a profit. As a matter of fact, the Slocan has this year just held its own as regards tonnage of ore mined and values produced.

Each year seems to present some particular feature of interest, and this year it is the greatly increased copper production of the Province. The production for the year has been 27,603,746 pounds of fine copper, valued at \$4,446,963, an increase of 17,606,666 pounds and \$2,831,674 over that of the previous year, or about 175% increase in value. It may here be noted that the recent break in the copper market did not occur until the last month of the year, and, as in estimating the values as above the average price for the year is employed, the value of the product has not been seriously affected. This copper has been derived as follows:

Districts.	Pounds.
Boundary.....	14,511,787
Trail-Rossland.....	8,335,446
Coast.....	3,115,872
Nelson.....	1,599,449
Other districts.....	43,192

Total.....27,603,746

It has to be recorded that as yet very little iron ore as such has been mined in the Province. There have been a few experimental shipments made and a considerable amount of development work carried on, but from the very nature of things iron ore to be handled at all necessitates an iron blast furnace to treat it, which is not as yet an accomplished fact in British Columbia, and will not be until sufficient development has been done to fully establish both the quantity and quality of the ore supply to justify its erection. The statistics show that 5746 tons of ore were shipped, which, as before stated, were used for experimental purposes or as a flux in smelting other ores.

Manager Clermont Livingstone of the Tye mine, Mount Sicker, is hocking out ore. The aerial tramway to convey the ore from the mine to the E. & N. track at Somenos, 4 miles, whence it will be shipped over the E. & N. to Ladysmith, will be completed August 15. Work on the Tye smelter at Ladysmith is progressing. Fifty men are employed at the mine, forty on the tramway and forty at the smelter.

At Nelson work at the Granite-Poor-man mill is to be resumed. Plans for an

addition of twenty stamps to the present 20-stamp mill are being prepared.

The Referendum mine, near Nelson, will set up its 5-stamp mill and begin treatment of ore.

The Ward Horsefly Co. is the only mining company now working at Harper's Camp. Manager Ward is working the ground made available by turning the course of the river. The hydraulic elevator is lifting 52 feet. A part of the ground is shovelled into boxes and is paying.

Manager M. Bailey of the Cariboo Gold Fields Co. has a circular pit about 250x350 feet and 70 feet from the top to bedrock. The top layers of dirt, from 10 to 15 feet thick, is the gravel washed down the creek by pioneer miners. The work in the pit is carried on as it would be in any hydraulic mine, up to the point of disposing of the gravel after it has run through the sluice boxes. It is in these sluice boxes that most of the gold is caught. After the dirt leaves the sluice boxes it falls into a reservoir and is elevated to the surface, passes over grizzlies and through a revolving screen, and is then carried in sluices to the nearest low ground. The elevator buckets are run fifteen to the minute, and in twenty-four hours lift about 2400 cubic yards. A 24-inch wheel, fed by an 8-inch pipe under a 500-foot head, is the motive power.

The Similkameen Star has a report from McRae Bros., who have returns on samples of ore from the Hamilton claim sent to Baker & Co. of Newark, N. J., to be assayed for platinum. The samples ran 60 ounces per ton in platinum, 1.12 ounce gold and 28% copper.

Greenwood reports that neither the British Columbia Copper Co.'s smelter at that place nor the Sunset smelter, 3 miles below, has been running for three weeks. Since the strike at Fernie no coke has been regularly furnished by the Crow's Nest Pass Coal Co., and as soon as the reserve of coke at the smelters was exhausted they were compelled to close down. The Granhy Co. has succeeded in getting coke from Fernie, Michel and also from the more recently opened up coal mines at Frank.

INDIA.

The Cauvery Falls electrical power transmission works in India, which have taken two years to construct, will be in operation next month. The plant is designed to generate 4500 H. P. for transmission 95 miles to the Kolar gold fields, where it will be distributed among ten gold mines, the best known of which are Mysore, Ooregum, Nuudydroog, and Champion Reef. The transmission line, consisting of telegraph posts carrying six strands of copper wire, runs through hilly jungles infested by tigers and panthers. The nearest railway station to the power station is 30 miles distant. Tame elephants were requisitioned to help convey the machinery from the railway.

KOREA.

H. F. Meserve, general manager L. S. J. Hunt's mines in Korea, 300 miles from Seoul, the capital of Korea, has concessions from the Government covering 25 square miles. The rock is gold bearing quartz. At present he is operating 120 stamps on the property and two cyanide tanks, and are now building an 80-stamp mill—200 stamps in all. The product is shipped to Japan in the form of gold bars. The company employs 7000 miners, including about eighty Americans. The others are Koreans, Japanese and Chinese. The Asiatics receive 25 cents in gold or 50 cents silver money per day, on which they live well. The Americans are over-eers.

MEXICO.

The La Luz Mines Co. of Guanajuato propose to build a mill and expect to be ready to begin Nov. 1st.

The Guanajuato Con.'s new 60-stamp mill will be in operation next week and will handle 200 tons daily.

The principal part of the Mexican quicksilver is mined at Huitzoco, State of Guerrero—Mina Cruz y Anexas. This mine has been worked since 1874 and is producing 3500 tons ore each month, from which 230 flasks of quicksilver are made. The work of extracting is simple and primitive. After the mineral is broken off in pieces weighing five or six pounds, it is roasted in specially constructed ovens. The smoke and steam are caught in a vast chamber where the quicksilver is precipitated, mixed with the soot and other solid substances. Once a month this deposit is gathered and collected on sheets of iron and inclined to a certain angle. This substance is revolved slowly, the quicksilver is separated and precipitated to the bottom, from which it falls into an iron boiler. From this it is drawn off into flasks.

President Hine of the Guanajuato Power & Electric Co., after a careful study of the conditions prevailing there—a combination of the two factors of cheap power and the cheap milling of Guanajuato ores (at a

cost of \$2.25 gold per ton, with a recovery of from 80% to 90% of the hullion content)—says that he believes the production of the next fifty years will be greater than it has been during the past three centuries.

SONORA.

Manager Murray of the Sublate mine says the 10-mile water pipe line which is being built from Agujito to the mines will be completed August 15.

Personal.

A. A. VERNON is manager Big Four mine, Ymir, B. C.

H. B. MAXSON of Reno, Nev., is visiting San Francisco.

T. C. GRAY is now Supt. Valley Queen mine, Sumpter, Or.

WM. CAMERON is Supt. Occidental mine, Iowa Hill, Cal.

THOS. BOTSCHIEDER is Supt. Sunrise mines, Missoula, Mont.

T. C. DUDLEY is Supt. California quartz mine, Bath, Cal.

JAS. J. WARREN is manager White Bear mine, Rossland, B. C.

R. H. BYLES of London is examining Atlin, B. C., hydraulic mines.

A. CHESTER BEATTY has returned from Kokomo, Colo., to Denver.

CHAS. ADAMS is Supt. Cataract M. Co., North Fork, Plumas county, Cal.

THOS. McDONALD is manager Bloss & McClary mine, Trinity Center, Cal.

S. D. NICHOLSON has been re-elected general manager Midas M. Co., Leadville, Colo.

THOS. GOODWIN is elected general manager New Monarch M. Co., Leadville, Colo.

F. S. WINTERS, Supt. Silver Reef M. Co., Leeds, Utah, is visiting Gunnison, Colo.

G. W. CROWE, manager Arizona G. & C. Co., Patagonia, Ariz., has gone to Chicago.

E. R. BRADEN took charge of the A. S. & R. Co.'s smelter, East Helena, Mont., recently.

STEPHEN BIRCH is superintending Capt. DeLamar's copper reconnoissances in Alaska.

J. C. STEELE of the Golden Jubilee mine, Trinity Co., Cal., is visiting San Francisco.

J. D. HUBBARD, a Siskiyou county, Cal., assayer and metallurgist, is in San Francisco.

R. H. HUTCHENS, late Supt. Mother Lode mine, Greenwood, B. C., has gone to South Africa.

H. N. COOPER of Berkeley, Cal., goes as U. S. analytical chemist to Manila, P. I., U. S. A.

J. J. CRAWFORD of San Francisco is examining mining property in southwestern Oregon.

H. A. KELLER of San Francisco, Cal., is examining copper properties at Latouche Island, Alaska.

L. E. AUBURY, California State Mineralogist, has returned from Los Angeles, Cal., to San Francisco.

PERCEY SHARPE is now manager Monte Verde Grande C. Co., Magdalena, near Ixmiquilpan, Sonora, Mexico.

F. H. NEWELL, J. B. LIPPINCOTT AND L. H. TAYLOR of the U. S. Geological Survey are in San Francisco.

C. WEIDER has been appointed Supt. Brown-Pullen-Mayhew lease on the Jerry Johnson, Cripple Creek, Colo.

DANA HARMON has returned to San Francisco from an examination of mining properties in southern California.

B. BROOKS takes the superintendency of the lead mine at Ilse, Custer county, Colo., owned by the Grant smelter.

P. A. H. FRANKLIN, president Blackbird and Bluebird companies, has returned to Beaver, Utah, from Chicago.

DAVID T. DAY has returned from investigation of platinum properties in Josephine county, Or., and Del Norte county, Cal.

H. J. MASTERS has resigned as superintendent U. S. Slate Quarry, Bangor, Pa., to accept a similar position with the Eureka Slate Co., Kelsey, Cal.

S. SPROUT AND C. W. WALLER, interested in the proposed installation of a power plant on McCloud river, Shasta Co., Cal., have returned to San Francisco.

T. J. HURLEY of the Mine Securities Corporation and N. S. Shaler of Harvard University are en route to Alaska to examine mining property near Ketchikan.

ERNEST GAYFORD, late superintendent Horseshoe G. M. & M. Co., Fay, Nev., is at Mineral Springs, Union county, North Carolina, conducting tests for the Colossus G. M. & M. Co. for the Howle

mine, preparatory to erecting a 500-ton cyanide mill.

A. H. BROWN, general manager Trinity Copper Co., has returned to Kennet, Cal., from San Francisco.

ALVIN PHILLIPS of Denver has been appointed consulting and directing engineer for the Henson Creek Lead Mines Co., Lake City, Colo.

S. I. HALLETT, manager Silver Lakes M. Co., Silverton, Colo., has returned after an examination of mining property in southern Santa Fe county, New Mexico.

E. H. BENJAMIN, secretary California Miners' Association, has returned to San Francisco from an inspection of mine property at Hayden Hill, Lassen county, Cal.

T. H. OXNAM, who recently resigned as general manager of the Palmarejo & Mexican Gold Fields Co., Chihuahua, Mexico, has been appointed consulting engineer of the same company.

At a dinner recently given at Jobaneshurg, S. A., to W. L. Honnold, formerly of Calaveras county, Cal., there were twenty-six engineers and managers present, of whom fourteen were Americans.

E. E. CALVIN is general manager of the railway line built by Utah and New York men which will haul ore from the copper mines, Corra de Pasco, Peru, to Callao. The position is reported as carrying \$20,000 a year.

ROBSON L. WHITE, recently Supt. Highland Boy, Utah, smelter, and who last month declined a position at \$20,000 per year with McCune & Haggin in their Peruvian mines, is now general Supt. Standard Oil Co.'s plants at a large salary.

The thirty Colorado delegates to the International Mining Congress at Butte, Mont., Sept. 1, 2, 3, 4 and 5, are as follows: H. M. Teller, T. M. Patterson, J. F. Shafroth, C. S. Thomas, J. D. McCarthy, C. B. Whitford, Denver; B. F. Montgomery, F. J. Hanks, Cripple Creek; T. J. Ehrhart, Centerville; J. G. Schweigert, West Cliff; H. L. Lubers, Las Animas; W. L. Seeley, Boulder; T. Annear, Silverton; J. Kennedy, T. Stevens, Ouray; A. Mulqueen, Aspen; F. J. Annis, Fort Collins; W. E. Renshaw, Idaho Springs; F. C. Bolsinger, Central City; F. E. Wheeler, Creede; D. W. Shores, Carbonate; I. N. Bunting, Grand Junction; R. S. Ball, Meeker; R. E. Foote, Breckenridge; E. Bell, Trinidad; C. McConnell, Durango; J. W. Finch, F. M. Woods, Victor; W. S. Buckley, Telluride; A. V. Hunter, P. Mulrooney, Leadville; B. J. O'Connell, Georgetown; F. H. Frankenhunter, S. D. Trimble, Pueblo; J. C. Bell, Montrose.

Obituary.

LOUIS A. DUNKLE, Supt. of the Le Roi mine, Rossland, B. C., was instantly killed on July 27 by a cave on the 600-foot level of the mine. While a resident of Eureka, Nev., he served two terms as sheriff. Later he lived in Angels Camp, Cal., rising to the position of foreman at the Utica mine. Prior to going to Rossland, in December, 1901, Mr. Dunkle was Supt. of the Grant-Mariposa mine, in Mariposa county, Cal.

Commercial Paragraphs.

THE California Wire Works have moved their office to 46-48 Fremont St., San Francisco, Cal.

W. J. JONES has been appointed manager of the Denver office of the Stanley Electric Mfg. Co. of Pittsfield, Mass.

THE Holthoff Machinery Co., Cudahy, Wis., has, as its Mexico representative, R. E. Briggs & Co., Calle Gante No. 8, City of Mexico.

THE Jeanesville Iron Works Co., Jeanesville, Pa., the largest industry in that vicinity, will be removed to Hazelton, Pa. The works employ about 500 skilled men.

MR. SCHORR, M. E., of the Shannon Copper Co., Clifton, Ariz., and Mr. Paulsmeyer, M. E., late of the Rison Iron Works, have established an engineering bureau at 206 Sansome St., San Francisco.

THE Allis-Chalmers Co., Chicago, Ill., has declared the fifth consecutive quarterly dividend of 1 1/2%, payable August 1st, out of net earnings. A detailed financial report of the company's business appeared in the issue of June 28, 1902, occupying a full page and showing a prosperous condition of affairs, fully justifying the preliminary announcement made at the time of the company's incorporation.

THE Bear Gulch M. Co., of Jardine, Mont., have placed an order with the Salt Lake branch office of the Allis-Chalmers Co. for a 40-stamp mill, complete with bin gates, feeders, high mortars, forged steel shoes and dies, cast steel cams, tappets and

stamp heads, copper plates and pulleys, pillow blocks, shafting, etc. Also, for No. 5 style "D" Gates crusher, with manganese hoods and concaves, and two orders each for forty steel shoes and forty forged steel dies—one for the Gold King Syndicate and one for the Bear Gulch M. Co., Jardine, Mont.

Latest Market Reports.

SAN FRANCISCO, Aug. 1, 1902.

METALS.

SILVER.—Per oz., Troy; London, 24 3/4 (standard ounce, 925 fine); New York, bar silver, 52 1/2, refined (1000 fine); San Francisco, 53c; Mexican dollars, 43 1/2c San Francisco, 41 1/2 New York.

COPPER.—New York: Standard, \$11.30@11.50; Lake, 1 to 3 casks, \$11.65; carload lots, \$11.40; Electrolytic, 1 to 3 casks, \$11.50; carload lots, \$11.30; Casting, 1 to 3 casks, \$11.50; carload lots, \$11.25. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: 252 15s 1d spot, per ton.

LEAD.—New York, \$4.12; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4 1/2c 1000 to 4000 lbs.; pipe 5 1/2, sheet 6, bar 5 1/2c; pig, \$4.75. London: £11 12s 6d per ton.

SPELTER.—New York, \$5.35; St. Louis, \$4.50; London, £18 17s 6d per ton; San Francisco, ton lots, 5 1/2c; 100-lb lots, 6 1/2c.

ANTIMONY.—New York, Cookson's, 9 1/2c; Hallett's, 8 1/2c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$28.10; San Francisco, ton lots, 31c; 1000 lbs., 31c; 500 lbs., 31 1/2c; 200 lbs., 32c; less 32 1/2c bar tin, 3 1/2c. London, £125 12s 6d spot.

PLATINUM.—San Francisco, crude, \$13.00 3/4 oz.; New York, \$18.50 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$48.00 large lots; London, £8 15s; San Francisco, local, \$46.00 3/4 flask of 7 1/2 lbs.; Denver, \$50.00. Export, \$44.00.

BABBITT METAL.—San Francisco, No. 1, 10 1/2c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100-lb. lots, 16 1/2c.

NICKEL.—New York, 50@60c 3/4 lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.00; gray forge, \$21.00; San Francisco, bar, 3c 3/4 lb., 3 1/2c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$32 and \$33; open hearth billets, \$34.00; San Francisco, bar, 7c to 12c per lb.

Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.55, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s. 10c 3/4 set; 14 oz., 40s., 9c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$7.50; Brynbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$11; Welsh Anthracite, \$13.00; Rock Springs, \$9.00, long ton; Colorado Anthracite, \$14.00. Coke, \$13 per ton in bulk, \$15 in sacks; Sunnyside, \$11.50, long ton.

One of the singular things is that today anthracite coal is selling at \$8 per ton in New York City, and the best quality of bituminous coal at the same price in San Francisco.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 27@28c 3/4 lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 66% B, 2c 3/4 lb.; soda ash, \$2.00 3/4 lb.; hyposulphite of soda, 23@23c 3/4 lb.; blue vitriol, 5 1/2@6 1/2c 3/4 lb.; borax, concentrated, 7@8c 3/4 lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, \$2.00@2.25; flour sulphur, French, 2 1/2@2 3/4c; California refined, 1 1/2@2c; nitric acid, in carboys, 8c 3/4 lb.; caustic soda, in drums, 3@4c 3/4 lb.; Cal. s. soda, hbls., \$1.25 @1.50 3/4 lb.; sds., \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls., 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linsed, boiled, hhl., 73c; cs., 78c; raw, hhl., 71c; cs., 76c; lots of 5 hbls., 1c less; Lucol oil, hbl., 64c; cs., 70c; raw, hbl., 62c; cs., 67c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13 1/2c; Mineral Seal, iron bbls., 19c; wooden bbls., 22 1/2c; cs., 25c; Mineral Sperm, cs., 26 1/2c; Deodorized Stove Gasoline, hulk, 16c; do., cs., 21 1/2c; 88° Gasoline, bulk, 20c; do., cs., 26 1/2c; 68° Naphtha or Benzine, deodorized, in hulk, per gal., 14 1/2c; do., in cs., 21c; Lard Oil, No. 1 hbl., 60c; cs., 65c; Neatsfoot Oil, hbl., 70c; cs., 75c; No. 1 hbl., 52 1/2@55c; cs., 57 1/2@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, cs., 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6 1/2c; 1 ton and less than 5 tons, per lb., 6 1/2c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7 1/2c; in 25-lb. tin pails, 1c per lb. above keg price; in 1 and 1/2 lb. tin cans, 100 lbs. per case, 2 1/2c per lb. above keg price. Dry Lead.—In hbls., 1 ton and over, 6c; do. in kegs, 6 1/2c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7 1/2c; less than 500 lbs., 7c.

ASSAY LITHARGE.—Per lb., 8 1/2c.

BISMUTH.—Sunbrite, per lb., \$1.60.

BONE ASH.—4c 3/4 lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, 3/4 lb., 60c.

MAGNESIUM.—Per lb., \$3.00.

MANGANESE.—(90% and over) 3/4 lb., \$1.25.

MERCURY.—Bichloride, 3/4 lb., 90c.

MOLYBDENUM.—25c. 3/4 gramme; 1000 grammes—2 1/2 lbs.

PHOSPHORUS.—(American) 3/4 lb., 80c.

SILVER.—Chloride, 3/4 oz., 75c; nitrate, 55c.

SODIUM.—Metal, 3/4 lb., \$1.00.

URANIUM.—Oxide, 3/4 lb., \$3.50.

ZINC.—Metallic, chemically pure, 3/4 lb., 50c.

ZINC.—Dust, 3/4 lb., 10c.

ZINC.—Sulphate, 3/4 lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC LOCKING MECHANISM FOR SIDEWALK OR OTHER ELEVATOR DOORS.—No. 704,746. July 15 1902. P. H. Jackson, San Francisco, Cal. This invention relates to an automatic mechanism for securing and releasing elevator hatchway doors, and is especially applicable to the doors which close over sidewalk elevator platforms or hoists. It consists of an elevator hatchway having doors hinged at opposite sides to close centrally, bolts guided and slidable parallel with and contiguous to the edge of one of the doors,

and a hollow sleeve into the end of which the adjacent ends of the two bolts extend, forming two members, said bolts and sleeve having pin and slot connections. An annular flange projects around the periphery of the sleeve and there are lugs or channels upon the door between which said flange is guided and turnable. A weight is hinged to and projects from the sleeve at right angles with its axis of rotation, and a supplemental weight projects from the outer end of the first-named weight and is turnable loosely with relation thereto. Stops are arranged by which the turning movement is arrested and the weight is caused to stand at an angle when the doors are opened.

INK WELLS.—No. 705,485. July 22 1902. G. H. True, East Oakland, Cal. This invention is designed to provide an ink well of the class which may be fixed in desks or similar structures, and to provide a permanent dust-proof structure, with means for obtaining access to the interior of the well. The well has a horizontal flange and a vertical cylindrical well of less diameter extending above and having an opening therethrough. A cap with a corresponding opening on one side fits over the extension, and a clamp by which the cap is held in place is revolvable in a horizontal plane. The clamps extend across the top of the cap and continue down the sides, having vertical channels to receive the extending portion of the clamp.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has issued reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING JULY 22, 1902.

705,194.—DRESS CHART.—Mary L. Avery, Oakland, Cal.
705,303.—CAR STANDARD.—E. O. & M. L. Bradley, Tacoma, Wash.
705,383.—CARRIER.—J. G. Cofman, Comptche, Cal.
705,216.—FUEL.—J. T. Davis, S. F.
705,060.—PIPE WRENCH.—J. T. Ford, S. F.
705,306.—JUN CLEANER.—G. H. Garrison, Bucoda, Wash.
705,071.—PACKING FRUIT.—L. F. Graham, San Jose, Cal.
705,401.—GATE.—S. Hamilton, Endicott, Wash.
705,403.—SQUARE.—C. L. F. & M. C. Hooker, Boca, Cal.
705,411.—TYPE WRITER.—O. L. Ingram, Walla Walla, Wash.
705,256.—SEWING MACHINE.—F. T. Leitch, S. F.
705,257.—SEWING MACHINE.—F. T. Leitch, S. F.
705,268.—GRGVOING TOOL.—A. R. Meister, Sacramento, Cal.
705,149.—REFINING COPPER.—G. Mitchell, Naco, Ariz.
705,425.—PUMP.—B. Musser, New Whatcom, Wash.
705,431.—VEHICLE BRAKE.—J. Ortel, Tempe, Ariz.
705,433.—TRAVELING BAG.—Phillips & McHenry, Portland, Or.
705,147.—DOOR OPENER.—G. Rischmuller, S. F.
705,301.—LATCH.—E. J. Root, S. F.
705,465.—LOG RELEASER.—E. W. Spencer, Portland, Or.
705,483.—INK WELL.—G. H. True, East Oakland, Cal.
705,187.—WATER HEATER.—F. Walker, Los Angeles, Cal.
705,184.—INKING APPARATUS.—Woodruff & Caton, San Jose, Cal.

SITUATIONS WANTED.

Chemist and Assayer with five years' experience in both mine and smelter work desires position. Technical graduate; finest references. Address "Chemist and Assayer," care of this office.

WANTED.—An all-round miner wants position as foreman. Over 22 years' experience in practical mining and handling men. Best of reference. Address Call Box 29, Welser, Idaho.

WANTED.—Employment at mine by young, experienced Assayer, Surveyor and Bookkeeper. References. Address A. H., care of this office.

Position wanted by Assayer and Surveyor at present employed in Arizona. Will go any place. Few years' experience East and West, and a good technical education. Address A. B. C., care of Mining and Scientific Press.

WANTED.—Position as Assayer and Bookkeeper in a mine; experienced in underground work; good references; present position not desirable. Address Box No. 127, care of this office.

PRACTICAL MILLMAN.—AMALGAMATOR, Classifier, Man and Assayer, wishes position. School of Mines graduate. Best references. Address R. B., care of Mining and Scientific Press.

WISH A POSITION AS SUPERINTENDENT or Assayer. Have had experience in mining, milling, cyaniding and smelting, and in putting up and running the machinery. Can sharpen tools. Jesso L. Wetmore, 644 E. Main St., Stockton, Cal.

MINE FOREMAN.—Young man (33) with 14 years' experience as a practical miner in Montana, Idaho, Black Hills, Arizona and California, energetic and possessed of fair technical knowledge, desires position with some progressive company. Fully conversant with standard air drills and familiar with all systems of timbering. Would like position where progressive methods are used to economical extraction would be appreciated. Foreign countries not objected to. First-class references as to ability and general reputation. Address C. M. A., care Mining and Scientific Press.

A technically educated Mining Engineer, at present employed as superintendent of mines for one of the largest corporations in Mexico, desires a change of position to the United States about July 1st. Has had 18 years' successful experience as engineer and superintendent, never having made a failure; 36 years of age; strictly temperate; a skilled designer, geologist and metallurgist; and a practical miner, as well as a hard worker and thorough business man. References of the highest order, including present employers. Address Supt., care this office.

EXAMINATION OR SUPERVISION of Mines, Smelters and Mills.

Mining Engineer and Metallurgist, of unquestionable reputation and long experience, now permanently residing at Seattle, Wash., will examine or take general supervision of mines, smelters or mills, in Pacific Coast States, British Columbia or Alaska, as consulting engineer, for reliable parties. Is also reliable accountant to examine. Box 813, Seattle.

WANTED.

A YOUNG MECHANIC WITH SEVERAL EXCELLENT patentable ideas would like assistance of capitalist or manufacturer. No airships, just plain every-day necessities. Address J H., care of this office.

WANTED—BY TWO ENERGETIC AND EXPERIENCED mining men the acquaintance of someone interested in the development of mining property in old Mexico. Address D. L. C., care of this office.

Wanted to Bond a Dry Placer Claim, One Rich in Flour Gold.

Must be a dry proposition. Address "Placer Claim," care this office.

WANTED.**FREE GOLD PROSPECT**

on which to incorporate a company, or to develop under lease and bond. Must be gilded and have ore of milling grade in sight. Send full particulars to H., care of this office.

FOR SALE.**Gold Mining Properties For Sale.**

Two First-Class Placer Mines, one having 20 years' record as a producer. Both in good working condition. Terms reasonable. Address "Enquire," care this office.

The Mines Exchange, Ltd.

Mines and prospects in British Columbia, the Western States, and Mexico, for sale. Free milling gold properties a specialty. Write us for reports and information. Bank references given. Address THE MINES EXCHANGE, LTD., P. O. Box 700, Nelson, B. C. Branch Office: P. O. Box 584, Salmon City, Idaho.

Determination of Minerals.

An article, "Hints to Prospectors," on page 62 of last week's issue, concerning the advisability of looking out for other things than gold, silver and copper when on a prospecting trip, has led to sundry suggestions that a few remarks on determination of minerals so noted might not be amiss.

In this regard it may be said that in the rough determination of an unfamiliar mineral the senses should work together; to determine exactly characteristics, one at a time, is laboratory rather than field practice. A trained mineralogist cannot always be sure and prompt in making determinations, and the best that the beginner or prospector can hope to do in many cases is to determine a mineral approximately. Minerals show such an infinite variety of color and form, and the number of distinct species is so large, that an attempt to remember the appearance of all species is not to be recommended. Yet the common species are not many, and with them the prospector should be familiar. When a strange feature is found the most obvious characteristics will be the color and the crystalline form, but these are often insufficient to determine the material, and further tests are necessary. Only persons of scant knowledge and little experience give hasty opinions with confidence. It is essential that the mineralogist should know quartz, feldspar, mica, calcite, hematite, galena, pyrite, sphalerite and chalcopryite so well that he can be certain of the mineral by a simple test. In this connection it is well to remember that a mineral of unfamiliar look is more likely to be a rare form of a common mineral than a rare mineral. When the mineralogist finds a mineral that looks strange he mentally runs over the characteristics of the common minerals most resembling it, and then by a simple test can often decide definitely. Thus albite, feldspar and baryte may have the same color and the same general form, but a test of hardness with a knife blade would settle all doubt, to say nothing of baryte feeling noticeably heavy. Beryl and apatite occur in green, hexagonal crystals, but beryl is much the harder. A test with a piece of quartz settles all doubt. Much can be determined by hand and eye, however—often the form and structure of

the mineral, its cleavage, color, luster and transparency. Then should come tests for hardness. A calcite crystal, a steel knife blade and a quartz crystal in the majority of cases will show the hardness with sufficient accuracy. The color of the streak or powder left in making the hardness test is often of importance and must be noticed. A magnetized knife blade will determine magnetite and pyrrhotite at once. Specific gravity tests need special apparatus for exact work, but if the mineral feels noticeably heavy the fact is often important. The tests of the mineral and its feel are important. Having exhausted the simple tests and being still in doubt, the observer may try chemical tests. Dilute hydrochloric acid will make bits of calcite effervesce briskly, while other carbonates will effervesce in concentrated or hot hydrochloric acid. The odor of sulphuretted hydrogen is easily detected when effervescence takes place with warm acid. The smell will show that the mineral effervescing is not a carbonate, but a sulphide. The solution obtained may be tested for copper or iron, and, if the mineral is insoluble, the fact is of importance. If the mineral is still undetermined, recourse to the blowpipe is necessary. Heating any mineral of metallic luster in the open tube will determine the presence of sulphur, arsenic, antimony and mercury; the closed tube tests will confirm those of the open tube. Heating on charcoal will show the presence of lead or zinc, also, in many cases, by the addition of soda, of any reducible metals, as lead, copper, silver, tin, etc. To obtain

reliable results in the above tests pure mineral should be used; this is particularly true in the case of sulphide ores. Often such ores are not a single distinct mineral, but a mixture of minerals. Any mixture of these various minerals in making tests will vitiate results.

If, after this procedure, the mineral is still undetermined, recourse should be had to some complete determination table, and, if the mineral is a distinct species, a person having a little skill in using the blowpipe can soon determine it.

Head Frames for Shafts.

In the issue of May 24, '02, appeared illustrations of shaft head gear of recent construction in California, Colorado and Montana. Herewith is presented a picture of a type of timber construction, in which it is designed that there shall be eliminated useless members, and wherein the working strains are met in the most direct manner. The head gear portrayed has just been erected at the Keystone mine, Amador county, Cal. It will be noted that, although the shaft is an incline with the winding engine on the hanging wall, yet the resultant falls well within the base of the structure, making the strains on all principal members compressive. The top of the posts and braces are simply scarfed and bolted together, and upon the apex thus formed the journal box is seated. The hoisting strain is thus taken up directly by the posts and braces, without the expense and intervention of caps, stringers and bridge trees, as in some four-post "California types." In the Montana type the bridge trees and girts are framed together, and to the posts by mortises and tenons, upon which the entire strain is thrust. This construction utilizes but a portion of the strength of the members, and the transverse strains on bridge trees and girts is so severe that the type is ordinarily suitable only for light duty. The Keystone frame, with slight modifications, is suitable for inclines with the winding gear on the foot wall as well, and also for vertical shafts. The frame, as shown, was designed and constructed by D. E. Bigelow of the Union Iron Works, San Francisco, Cal. The lower engraving is a flashlight view of the timbering in the 500 level, foot wall, 900 feet south of main shaft, 100 feet wide between walls.

Value of the Hot Blast in Smelting.

In the concluding article on "Costs and Profits in Pyritic Smelting of Low-Grade Copper Ores," which appeared in the issue of the MINING AND SCIENTIFIC PRESS of June 21, 1902, calculations were given based upon hypothetical smelting conditions in which the heat generated in the furnace by the oxidation of coke, iron and sulphur added to that brought in by the hot blast made a total of about 400,000 British thermal units per minute, while the heat carried off by the escaping gases amounted to 27% of this on the assumption of a temperature of 600° above that of the external air and 133% surplus air (that is, the surplus above the chemical requisite).

The usual method of calculating the temperature of combustion is to divide the units of heat generated by the product of the weight of the resulting gases of combustion and their specific heat. The air per minute was 665 pounds and the resulting gases 668 pounds, making the increase in temperature, therefore, $400,000 \div (688 \times .238) = 2443^\circ$, which added to 62° gives 2505° Fahr. For reasons to be given this figure is too high, but following the method further we should have with 100% surplus air a temperature of 2900°.

As applied to a smelting furnace this method is based on several obviously wrong assumptions. The heat value of the fuels, iron, sulphur and carbon are based upon an initial temperature of 62° Fahr., whereas when they reach the smelting zone in a furnace they have acquired a high temperature and thus bring in additional heat which must be taken into consideration. On the other hand, silica and lime, although already at a high temperature, will absorb some heat in passing into the fusion zone. The main consideration is, however, that a considerable quantity of fuel is consumed before it can reach the smelting zone, and the amount, therefore, available for heating the air blast (in that part of the furnace where the highest temperature is required) is thereby reduced, which consequently reduces in the same ratio the temperature attainable at that point. In the estimate showing a possible temperature of 2900° Fahr. with 100% surplus air and 562° temperature of blast, on the basis that all of the fuel had been consumed in the smelting zone, the results would have been 585° less $[(2900 - 562) \div 4]$ or 2315° Fahr. in case 25% of the fuel had been allowed for as consumed before reaching that point.

In pyritic smelting a due proportion of iron and sulphur must be oxidized before reaching the smelting zone in order to avoid carrying too much of the readily fusible iron sulphides into the matte and thus rendering it too low grade. Under the conditions specified in the article referred to it was found that the temperature would have been 2500° Fahr. had all

the heat been generated within the limits of the smelting zone—which of course could not be the case. Half of the heat was derived from the iron and sulphur, the remainder from the coke and hot blast. Assuming that half the oxidation of the iron and sulphur had taken place above the zone of fusion, the calculated temperature would be 1900° Fahr., this being the average temperature, some portions of the zone being higher and others lower, slag formation, requiring a higher temperature, and oxidizing action, possible at a much lower temperature, going on simultaneously.

The sole benefit of chemical action taking place in the charge of ore, flux and fuel before it reaches the smelting zone is to prepare the ore and flux for the work to be done there. These chemical reactions take place at comparatively low temperatures, beginning below 500° and increasing in activity until the highest temperature of the furnace is reached. The reduction of Fe_2O_3 to FeO requires the presence of carbon or carbon monoxide, but in pyritic smelting the atmosphere is distinctly an oxidizing one, and coke in the charge is absolutely unessential except for the production of heat, and this heat is simply needed to create a sufficiently high temperature in that region of the furnace where fusion takes place. Heat alone is required to drive off the moisture, the volatile sulphur atom of the iron pyrites and the carbonic acid of the limestone. This heat and the heat necessary to raise the entire charge to the proper temperature before it reaches the smelting zone is present in the air and gases passing upward through the charge from that point, and hence it is plain that the more the heat is concentrated the greater will be the efficiency, the more uniform the smelting and the smoother the operation of the furnace. To accomplish this is the function of the hot blast, the saving of coke per ton of ore smelted and the increased capacity of the furnace being incidental thereto.

In pyritic smelting—by which is meant not the entire exclusion of carbonaceous fuel, but the roasting and smelting of sulphide ores in one operation, the heat generated being used to replace carbonaceous fuel, and which, therefore, requires an oxidizing atmosphere—every pound of coke consumed above the smelting zone is a clear waste, and only that portion of the coke which yields its heat for the sole purpose of bringing the temperature of the smelting zone up to the requirements of slag formation—which is somewhat higher than that of slag fusion—produces any useful effect.

A hot blast does not mean a hot top; quite the contrary. In fact, a change from hot blast to cold blast causes the zone of fusion to creep upwards in the furnace, and this action may sometimes be availed of to melt down the accretions that have formed in that region.

The quantity of heat required to raise the temperature of the blast 100° depends upon the amount of surplus air. In the diagram on page 73 the amount is assumed as 133% and the general results are sufficiently close to afford an approximate estimate under ordinary conditions.

The diagram covers coke cost up to \$30 per ton (2000 pounds) and varying costs and classes of fuel for heating the blast, which are designated under the headings A, B, C, D and E. The saving in fuel cost per annum per 100 tons daily charge, and per 100° increased temperature of blast, is given at the right hand side of the diagram. The estimate allows for ordinary delays and shutdowns and for average qualities of fuels, and is conservative.

For an example, let us take a 200-ton daily charge, a coke cost of \$15 per ton and an oil cost of \$1.25 per barrel, with the blast heated 500°. The heading B covers oil at \$1.25 and the line marked B intersects the vertical line of \$15 coke at the point marked X, which shows horizontally at the right a saving of \$1500, which for 500° and for 200 tons daily charge makes an annual saving of \$15,000. Line A, being the line for no cost of fuel, covers the case where the blast is heated by the waste heat of the furnace—that is, by the slag, the gases, or the jacket. Point Y marks the intersections of the line A and the \$15 coke line, and if it were possible to heat the blast 500° by such means the saving would have been for 200 tons daily charge \$25,000 per annum.

In an iron furnace about 80% of the carbon of the

coke passes off as carbon monoxide, but in pyritic smelting scarcely more than a trace of this gas will be found; so that there are only the three sources above mentioned which can be utilized—other than the cheap fuel—and of these the slag carries by far the most heat. Mechanical difficulties alone stand in the way of taking advantage of its full value, although it actually contains nearly double the heat required to bring the blast to a temperature of 500° above that of the external air. An examination of diagrams Nos. 4 and 7 (issues of May 31 and June 7, 1902), will make this clear. It will be noted that while the air required per minute to smelt 100 tons of ore varies tremendously with the type of ore used and the type of slag made, the amount of air per ton of slag produced is practically constant and depends simply upon the temperature of the blast, being practically independent of the per cent of silica or iron in the ore, or of the type of slag. Assuming 133% surplus air as the maximum requirement, there will be needed per ton of slag per twenty-four hours not to exceed 100 cubic feet of air per minute with cold blast and 80 cubic feet with a blast at 500° F., and for 100% surplus air, as a reasonable average, about 65 cubic feet. A ton of slag per day is 14 pound per minute, and the heat contained, sensible and latent, is about 1200 B. t. u., while that required to raise 65 cubic feet of air per minute 500° is 600 B. t. u.

The fact should not be lost sight of that the hot blast makes possible a more siliceous slag, thereby cutting down the amount of limestone flux and proportionately reducing the percentage of coke and effecting other small economies as a consequence, and also making easier a clean separation of matte and slag. It is believed that, as against all the advantages which have been enumerated in favor of hot blast, nothing as an offset can be said for cold blast.

Since for every 100° increased temperature of blast means an increased smelting capacity of nearly 5% for the same furnace, with same blower running at the same speed, it is proper in considering the cost of hot blast apparatus to compare it with what would have been the increased cost in order to have obtained the same capacity with cold blast by increasing the size of the furnace, the blower and the power department, allowing this credit against the cost of hot blast apparatus.

A NEW property of matter has just been discovered—radio activity. Incidentally three new elements are also reported discovered—radium, polonium, actinium. All works on chemistry must necessarily be revised. As in the case of metallurgy and electricity, the doers, the discoverers, the creators are ahead of the chroniclers in books. The latest discovery by Henri Becquerel is the greatest since Roentgen's discovery of the X-rays. It may lead to greater results. Becquerel has found a new source of light—uranium—which is demonstrated to emit rays capable of passing through copper, a new property of matter ranking with heat, magnetism, light and electricity. This new property of matter is affected only by the density of the substance interposed: aluminum is to the Becquerel rays what glass is to light. These rays will themselves photograph the substance which emits them. As investigation goes on it is found that this newly discovered property of matter has intimate connection with electrical effect. So far the discovery and conclusions tend to confirm the oft-advanced hypothesis that all we designate as "substance" is resolvable into one—and only one—primitive form of matter.

PROGRESSIVENESS in mining is constantly illustrated in a variety of ways as the columns of this paper weekly attest. Even in weird and wondrous tales of "lost" mines, desert treasure, wood ashes assaying "away up" in gold, etc., there is noted advance and variety in the summer of '02 over the fanciful yarns of previous summers. This week from La Junta, Colo., comes allegation that the La Junta M. & M. Co. has found that the boiler scale in its boiler assays \$84 to the ton in gold. Granting for ordinary courtesy's sake that the statement bears a semblance of remote possibility, the process does not commend itself to practical metallurgists. Robt. McAllister, Colorado's State Boiler Inspector, is locally given as authority for the mid-summer fantasy.

Concentrates.

TALC of best quality is worth \$13 50 per ton delivered in New York City.

SPEISS has a natural affinity for gold, but less than that of copper matte for silver.

WITHOUT any definite prior agreement, machinery on a mine under lease and bond belongs to the lessee at the termination of the time for which the property was leased or bonded.

ASIDE from pure sperm oil, the best lubricant for a shaft journal is cold pressed, winter strained lard oil, as it embodies the two primo requisites of perfect lubricant, fluidity and viscosity.

WHERE a person guarantees a note before its delivery, the consideration for the note is the consideration for the guaranty, and no new consideration moving to the guarantor is necessary to support the guaranty.

POSSESSION of mortgaged goods by the mortgagee cures any defects in the execution or recordation of the mortgage as against the creditors of the mortgagor attaching such goods after possession has been taken.

THE average elevation of mining camps in New Mexico is about 5000 feet; their latitudes are from 32° to 37°; the climate is equable and mining may be carried on every day in the year without interruptions as the result of bad weather.

PURE GOLD melts at 1045° C., and, if kept at a melting point or slightly above, will not volatilize appreciably. When the temperature is increased above 1045° C. gold volatilizes. In case of alloy present, the gold is volatile at considerably lower temperature.

SPITTING is a term applied to a method of lighting a fuse quickly. The end of the fuse is spread and a small piece of dynamite is pressed into it. This fires readily and starts the powder of the fuse, which sometimes without the spitting refuses to fire as quickly as desired.

CEMENT can be stored for almost any time if care be taken to protect it from dampness. Much depends upon the manner in which it is packed, but so long as there is a good circulation of air through the storehouse, and the stock is well protected from the weather, there will be no difficulty experienced with cement, although it may have been stored several years.

A CASE IN POINT with that of the Butte, Mont., inquirer was that of Smith vs. Jones et al., reported 60 Pac. Rep., Utah, 1104, where it was held by the court that a contract by plaintiff to sell, and by defendants' predecessors in interest to buy, certain mining property, which contract is personal, and does not in terms run to heirs and assigns, and under which the prospective grantees, although given possession, could neither sell nor assign, without the grantor's consent, until they had become entitled to a deed by performance of certain conditions, one of which was to pay grantor a certain sum out of the property, is a mere option to purchase, with a license to extract ore, and not a covenant running with the land.

AN efficiency of 92% is somewhat high to allow in figuring on the work done by a pump, but placing the efficiency at 92%, a pump with a 6-inch plunger, and a 15-inch stroke, making sixty double strokes per minute, would have a speed of 150 feet per minute, and would handle 12,161 gallons water per hour. The speed is found as follows:

$$\frac{60(2 \times 15)}{12} = 150. \text{ The quantity of water}$$

$$\text{hourly pumped: } 60 \times \frac{.92(7854 \times 6^2 \times 150 \times 12)}{231} = 12,161.$$

THE breaking strain of a $\frac{3}{4}$ -inch plow steel, 6-strand, 7-wire rope is thirty-two tons. An inch rope would weigh 1.58 pounds per foot. Such a rope three-quarters of a mile long would weigh $3960 \times 1.58 = 6256.8$ pounds.

MONTANA MINING LAWS authorize a non-joining co-tenant of mining property to recover his share of the profits of the mine, or his proportionate share of all ores on the dump, on payment or tender of the costs of mining the same in a miner-like manner. In the case of the Butte & Boston Con. M. Co. vs. Montana Ore Purchasing Co. et al., 60 Pac. Rep., Mont., 1039, it was held that where defendant, a co-tenant, wrongfully worked a mine through shaft from another mine, in which plaintiff had no interest and to which he had no right of access, plaintiff was entitled to an injunction restraining defendant from continuing work on such mine, though he failed to render his proportionate share to the cost of mining the ore extracted therefrom, since such tender was excused by the plaintiff's inability to ascertain what ores it was entitled to in order to estimate the amount of such tender.

It pays miners and prospectors to advertise and talk about the resources and probabilities of the sections in which they are directly interested. If a mining district is worth anything at all, it is worth talking about, worth keeping before the public, worth discussing in print. If it has nothing to recommend it, if there is nothing but a few barren prospect holes there, the sooner the miner who is blowing in his money gets out the better. But if a district has merit and can show up good mineral and encouraging prospects, the men who are interested there should not hesitate to tell what they know about it. They should get their district before the public eye. Newspaper talk never has and never will sell a single mine. But intelligent newspaper discussion of a mining section

attracts attention, leads investigators to examine personally the mines of the district, and, if it proves satisfactory, then investment will follow.

STRESSES are the forces which are applied to bodies to bring into action their elastic and cohesive properties. These forces cause alterations of the forms of the bodies upon which they act. Strain is a name given to the kind of alteration produced by the stresses. The distinction between stress and strain is not always observed, one being used for the other. There are tensile, compressive, transverse, torsional and shearing stresses. A tensile stress or pull is a force tending to elongate a piece; a compressive stress or push is a force tending to shorten it; a transverse stress tends to bend it; a torsional stress tends to twist it; a shearing stress tends to force one part to slide over the adjacent part. To these may be added tearing stress, which is either tensile or shearing, but in which the resistance of different portions of the materials is brought into play in detail, or one after the other, instead of simultaneously, as in the first three.

WHY one pound of fuel is worth more or less than another, and which, of several samples of coal, is worth the most for fuel purposes, are questions the answer to which is difficult to give. It should be understood that all fuel is a combination of carbon and hydrogen in varying proportions, and ready, under suitable conditions, to combine with oxygen. It is in this act of combining with oxygen that heat is developed, and the fuel thus becomes of use for the purpose desired. Carbon and hydrogen, however, are far from having the same fuel value. One pound of the former under perfect combustion would develop about 14,500 units, while a pound of the latter under like combustion would give about 62,000 heat units, or more than four times as much per pound. The value will also depend on the amount of non-combustible matter, or ash, which is present, and on the nature and proportions of the various other ingredients.

In passing within the side lines of a claim, should the vein at any point along its length go out of or across the side line, then the point of exit becomes the end line, beyond which the owner cannot follow the vein into the ground of another. In regard to crossing or overlapping claims, whether extending across the claim at right or obtuse angles, the Supreme Court of Colorado has in late years reversed itself, so as to be in harmony with the decisions of the highest courts of other States, and with the Supreme Court of the United States, and now hold that the owner of such cross vein is not entitled to the ore within the limit of the area of intersection, provided his is the junior. The statutes award the later locator the right of way across the senior, for the convenient working of his mine, but the ore taken out in making the crossing will belong to the senior, provided he can show that his vein enters into and crosses beyond the junior side lines.

In the assay of copper materials for gold and silver the following is usually satisfactory: Dissolve 0.5-0.4 A. T. ore in dilute nitric acid, using small quantities at a time, add some sulphuric acid, evaporate excess of nitric acid, cool, add cool, then hot water, and introduce hydrogen sulphide for a few minutes until all the silver with only a little copper has separated out as a flocculent precipitate which carries down all the gold and is easily filtered; filter, and proceed in the usual way by burning filter and assaying the ashes. The filtrate must be tested for silver with a pinch of salt or a drop of hydrochloric acid. Another method: Dissolve one A. T. in dilute nitric acid, boil, filter, add to filtrate sufficient salt solution to precipitate all the silver as chloride, allow to stand over night, when pressed for time stir vigorously by hand (or better, by compressed air), filter, scourify silver chloride, gold and insoluble residue together, cupel. With some copper materials very low in gold the all-fire method is more satisfactory, as gold seems to go into solution. In this method ten samples of 1-10 assay ton each are scorified with lead until most of the copper has been removed, then united and cupelled.

A ROOF TANK 10 feet in diameter at the top, 12 feet in diameter at the bottom, having a depth of 12 feet, and fed by a pump discharging 150 gallons of water per minute, when the pump is started, there being a depth of water of 2 feet in the tank, it will take the pump forty-six minutes to fill. That part of the tank above the water level may be considered as a separate tank. The taper of the tank is 24 inches in 12 feet or 2 inches to the foot; the diameter at the surface of the water will have been reduced twice this amount at a depth of 2 feet, or 4 inches. That part of the tank to be filled is 10 feet diameter at top and 11 $\frac{1}{2}$ feet diameter at the bottom, with a depth of 10 feet. The volume or capacity of a tapered tank is found by multiplying the mean area by depth. The mean diameter is obtained by adding the diameter at the top and bottom and dividing the sum by 2. In this case the mean diameter is $11.66 + 10 \div 2 = 10.83$ feet. The mean area is $10.83^2 \times .7854 = 92.11$ square feet and the volume or capacity in cubic feet is $92.11 \times 10 = 921.1$ cubic feet. One cubic foot contains 7 $\frac{1}{2}$ gallons and the capacity of the tank in gallons is $921.1 \times 7.5 = 6908.25$. The pump supplies 150 gallons per minute, so that it will take as many minutes to fill the tank as 150 is contained in 6908.25, which is 46.

THERE are a great many points on gasoline engines that must be watched if one expects to get along all right. If he does not watch them trouble is sure to come, no matter how good an engine he may have. Gasoline engines are to a great extent automatic, and this has led

to a prevailing idea that they do not need any attention whatever. This is a great mistake. There is no machine which does not need to be kept clean, oiled, adjusted to take up wear, etc. Among the most frequent difficulties are obstructions in check valve in the gasoline supply pipe, which will then not permit the gasoline to flow regularly. Air holes in the supply pipe also cause this irregularity of the flow of gasoline. Weak batteries, damp spark coils, broken insulation in the igniter head, or encrusted tubelgniters are all causes of trouble. There are many such points, and it is only by thoroughly studying the engine, its operation and adjustments, so that the operator becomes familiar with the action of the engine, that he will be able to readily detect the source of the trouble and tell its remedy. When he does become familiar with the engine—and it does not require an excessive amount of time or ability to do so—he will find that there is no better power to be secured than he has, and he will wonder why he ever had any trouble at all with it. The secret of it all is: "Know your engine."

WHERE a patent issues for public land under a law which provides for its disposition as agricultural land—either to a railroad company or to pre-emption or homestead claim—and there is no reservation in the law except a general one of mineral lands, and no reservation at all in the patent, then the patent must be considered as a conclusive determination by the Government that the land is agricultural. It is a rule of law that a defendant may defeat an action of ejectment by showing that plaintiff has no title, in that his patent is absolutely void. But yet where a patent, regular on its face, has been issued by the Government for land which it owns under a law providing for the disposal of the land patented, upon the ascertainment of certain facts (as to whether it is mineral land or adapted to agriculture) the officers of the Land Department of the Government have jurisdiction to determine such facts and the issuance of a patent is upon collateral attack (that is, otherwise than a suit brought for the single purpose of setting the patent aside on the ground of fraud or mistake) a conclusive declaration as against all claims under the Government, that the facts have been found in favor of the patentee. This applies as well to State as to United States patents. The plain meaning of this is that the judgment of the Land Department whether a certain tract is swamp land or not, one way or the other, is conclusive and not open to legislation in courts except in those cases of fraud, etc., which permit any determination to be re-examined.

ANY ONE wishing to have gold or silver assayed in quantity, or wishing to sell it to the Government, may present his property at the U. S. mint at San Francisco, Cal., the assay offices at Seattle, Wash., or Denver, Colo., where he may have the metal reduced and made into bars, or, if he prefers, he may sell his bullion direct to the Government. The charge for doing the work is merely nominal, and is based on the actual cost. When the metal is received, the first step consists in weighing the coin, bars, etc. This is done with great exactness and a receipt is given. Each person's holdings are placed in a box and are taken to the melting room, where they are placed in crucibles with a flux, smelted and cast in ingot molds. A small chip is taken from the bar for assay. The chip is taken to the assay room, where a hydraulic press reduces the sample to a size which permits of it being run through drawing rollers, so that the sample may be cut from the ribbon with the weight of one gram. This is placed in a small unglazed cup (a cupel) and a known quantity of silver, copper and lead is added before firing, for the following reasons: The function of the lead, which is in the form of a thin sheet, is two-fold; first, it serves as an envelope to hold the particles of bullion, silver and copper together while melting, and the lead also oxidizes freely, dissolving the copper oxide and making it possible for both oxides to be absorbed by the porous body of the cupel. Silver is added so that the proportion of silver in the sample of bullion shall be approximately two of silver to one of gold, and that in the subsequent acid bath the gold shall not surround or mask the silver, so as to prevent it from dissolving. In cooling, the button which remains in the cupel after firing is apt to spurt up, thus wasting a portion of its weight and destroying the value of the assay. The lead oxide assists the copper oxide to be absorbed by the cupel. The cupel and its contents are now placed in a muffle furnace, and heated for a period to insure complete melting. If there be any copper or lead present in the sample, they will become alloyed with the copper and lead added by the assayer, and will become oxidized and absorbed. The gold and silver, together with the known quantity of silver which has been added by the assay office, remain in the cupel in the form of a button. Each button is placed in a special tray, which keeps each sample by itself, and is then flattened and rolled, hotted in nitric acid, 32° Baume, for ten minutes, and then in fresh acid for ten minutes more. The silver is dissolved by the acid, forming silver nitrate, while the gold remains intact, because only nitro-hydrochloric acid dissolves it. Gold is left in the flask and is washed and weighed. The loss of weight in the furnace is base metal—lead and copper. The loss of weight in the nitric acid is silver and the remainder is gold. In the case of silver bullion it is subjected to the humid test as well. So far the Government has been acting as an assayer, but if the depositor wishes to part with his bullion, which is now of known value, the Government pays for it at the prevailing price and proceeds to separate or part the gold from the silver. The price of gold varies—\$20.67 ounce fine. Silver fluctuates with the market.

Live Foundations.

Written for the MINING AND SCIENTIFIC PRESS by C. H. FITCH.

The foundations discussed in previous articles may be described as "dead"—that is, mere supporting foundations, without resilience and vibration enough to be considered.

The end to be served in them was a spreading of the load. It was a question of pressure between a stronger and a weaker material, the whole requirement being, as was modestly said by the man who wore the skull cap, "to protect the weakest member." This protection to soft soil can only be obtained by spreading the pressure over a large area so as to lighten it per unit of area. And this diffusion of pressure is most effective at right angles to the general direction of pressure, which is vertical. Hence, the seat of pressure should be as large as necessary and practically horizontal. Nothing is gained by forms of penetration which have foundations upon other than a flat horizontal plane, except those inverted saucer or umbrella forms which balance pressures against side displacement.

But foundations which resist a live force call for a different theory. They have to stand such hammering as is made by unbalanced forces in locomotive driving wheels upon the rail and the hammering of stamps upon dies and mortar blocks. They must take up inertia.

But in milling gold ores under gravity stamps and in milling copper rock under steam stamps, the rebound or reaction was of course recognized and some theories were advanced without clear definition or good reason, attributing to this rebounding action some advantages in pulverization. The idea of these theories was that the blow delivered by the stamp on the ore passed through it to the anvil, and the latter struck back again, pulverizing the ore, which caught the blow going and coming—very much like the darky's animal trap. Action and reaction are equal. Anyone who discharges a gun or strikes a heavy blow with axe or sledge feels the reaction in his own person.

The idea that an elastic reaction helped crushing took hold of the imagination of mill men and engineers, including some very eminent ones. Gold stamps were given a timber base having considerable spring, and the large copper ore stamps by Ball of Chicopee, Mass., and later by E. D. Leavitt of Cambridgeport, Mass., for the Lake Superior mines, were constructed with special spring timbers. As the athlete is thrown into the air by the springboard, so was it understood that the mortar and die was thrown against the shoe, giving the ore between them an additional squeeze. The mind of man is in nothing more wonderful than in its logic, and from this point the conclusion was jumped at that more ore would be crushed with spring timbers, whereas in fact the spring blow cut the capacity in two, substituting an elastic movement for a pulverizing shock. Given motion enough of this kind, the power can be passed to and fro through ore without crushing it at all.

Still our wise engineers' eyes remained as unopened as those of new kittens, and in works costing many thousands of dollars spring timbers were always specified. For many years this little point was never thought out. It was taken for granted that what was specified by engineers supposed to be highly educated in theory, and huilt at machine shops of the widest reputation by men of the largest practical experience, must be superlatively correct and not to be questioned. Thus, one supposition leans upon another, like a row of bricks, the fall of one of which precipitates them all.

But it was an eminent engineer, now president of the American Society of Mechanical Engineers and chief engineer of the Allis-Chalmers Co., who detected the faulty theory. Edwin Reynolds turned the thing over in his mind and concluded that it was best to make the pulverizing blow as free from flexure and vibration as possible. If he had been a theorist only, the engineers who had a gap of guesswork in their theories might have safely laughed at him. But, as he was himself an engineer of large responsibilities, he was able to try it upon large and expensive works while others watched to see how he would come out. The result was that the capacity of the large Lake Superior stamps jumped from 200 or 250 tons to 400 or 500 tons a day—in fact, nearly doubled—largely due to this change. Now the idea is being applied to gold stamps by the use of heavy iron anvils. These never had such timbers as the copper stamps, and the room for improvement was less, but about 25% gain in capacity is claimed.

I think it of historic interest to reproduce the following letter:

MILWAUKEE, WIS., Feb 8, 1898.

MR. C. H. FITCH, 124 SO. GROVE AVE., OAR PARK, ILL.—DEAR SIR: Yours of the 5th received. The mortars of the Lake Superior stamps were placed on spring timbers until I designed a stamp to do away with the timbers and substitute dead weight in their place. I was criticised for presuming to do such a thing by every stamp mill engineer in the country that I came in contact with, Mr. Leavitt included. But my "foolish experiment," as it was termed, resulted in increasing the capacity of the stamps nearly 50%, 200 tons a day being considered an extraordinary performance for the best stamps until mine was put in use. The first week's record

made by my stamp after the condenser was attached was 1920 tons in six days, and I think some of them have records averaging 300 tons per day for the entire year. The first machine was that for the Tamarack Mining Co., and the results obtained were so satisfactory that all stamps in the Calumet & Hecla, as well, I understand, as all other mills, have been changed over, abandoning the timbers. I do not know of any public discussion on the subject, as I have no time to devote to such matters.

Yours truly, EDWIN REYNOLDS.

The condenser to which reference is made obtained the usual increase of power by vacuum, and, as before stated, the capacity of these stamps was increased to 500 tons in twenty-four hours, and the large part played in this increase by change from spring timbers to solid foundations is unquestioned. Now no one would put in spring timbers.

This is such a lesson to us to do our own thinking and not to trust to the reputed wisdom of authorities that I give in full the foregoing letter, showing the way in which a novel suggestion was received. The fallacy which held its ground so universally a few years ago is now seen to have no reason at all in sound theory. I believe that there are quite a lot of fallacies as pronounced as this still doing business in mining and metallurgical circles and thought—in other words, theory is required to ferret them out.

Practice goes on doing what its grandfather did: loading its mule with a sack of corn on one side and a stone on the other. Few men are great thinkers. In mechanical engineering W. J. M. Rankine was one—almost the one—for, while a wide range of new applications has arisen since his time, the whole profession has kept safely within the comprehensive ability with which he diagnosed engineering facts and drew from them a sound and far-reaching code of theory.

Copper in Northern California.

NUMBER II.—CONCLUDED.

By J. S. DILLER.

Bully Hill district: The Bully Hill district, including also Copper City, has been developed within the last few years under the efficient management of A. H. Brown. The arrangement for mining and handling the ore to the roasting bins, furnace and converters are excellent. Two converters were in operation last July, yielding about sixteen tons of copper daily, and one or more converters have been added since, indicating a good outlook.

In Bully Hill there are a number of zones containing ore. Only two zones are of importance—one in quartz porphyry (Bully Hill quartzite), and the other in a highly altered keratophyr. Although the main ore body in places appears to come in contact with the quartz porphyry, it is most intimately associated with a keratophyr, which contains more or less silica and more lime. The ore bodies mined were nowhere seen in the Triassic shales, but such shales with radiolaria occur in the tunnels a short distance to the eastward of the main lode. The general strike of the shear zones in which the ore bodies occur is from nearly N. to N. 10° E., with steep dip to the westward. The ore bodies are flattish, lenticular of irregular outline, and range in size from mere nodules to bodies hundreds of feet in length. The ore was seen from 4 to 12 feet in thickness, and the walls are often, but not always, well marked. Generally on the foot wall there is a white selvage, which, according to George Seitzer, contains Na₂O 20, K₂O 3.28, and H₂O 11.87, and appears to be a mixture of sericite and kaolin. It is very irregular, ranging from a mere film to 12 feet, and is used for lining the converters in the smelter.

The ore bodies are solid and composed of pyrite and chalcocite usually, with a greater amount of chalcocite and occasionally hornite, with traces of the carbonates and native copper. Sphalerite and barite are generally present and frequently more abundant than the other minerals. One body of ore is said to have assayed 15% copper, \$8 in gold and six ounces silver per ton. Where the ore is largely chalcocite, the content of copper is high, sometimes reaching over 46%, but the general range is said to be about 10%.

In the Copper City mines the ores are of the same nature as Bully Hill, but inclosed wholly in the sheared quartz porphyry. The shearing gives to this igneous rock the appearance of slate, but under the microscope the two are in general easily separated. The quartz porphyry passes into sericite schist in the shear zone, and is more or less heavily impregnated by sulphides, showing stages from partial to complete replacement.

The lode at Copper City runs north 50° east, and the lenticular bodies range in thickness from a mere film or nodule in the fissile schist to 5 feet or more in thickness and many feet in length. Sphalerite and barite are as abundant in the ores at Copper City as at Bully Hill.

Iron Mountain District: The largest and most important district of the copper region, as far as known at present, lies west of the Sacramento river and extends from Iron Mountain a few degrees east of north for nearly 20 miles to the Shasta King, near Kennett. The Iron Mountain mine is under the management of L. T. Wright, who has with diamond drill done more than any one else to get an accurate idea of the ore bodies and their distribution in the

district. The Iron Mountain mine is marked upon the surface by a prominent gossan of limonite, which in the early days was mined for gold and silver. In places the gossan extends to a depth of over 100 feet, changing abruptly from the oxides to the sulphides, but upon the steep slopes bordering the canyons the gossan has been removed and the bodies of sulphides lie nearer the surface.

In the Iron Mountain vicinity there are two principal bodies of ore—one the Iron Mountain and the other the Hornet. The Iron Mountain ore body is now being mined, and the large Hornet body has been thoroughly prospected. The ore appears to be wholly pyrites, carrying copper, with an admixture of chalcocite. The dark sulphides so common at Bully Hill are practically absent in this body, although at certain points in both the Hornet and Iron Mountain ore bodies there is considerable zinc, and the arrangement of the zinc in streaks gives the ore a schistose structure, which is referred to on the one hand as evidence that the bodies are true vein deposits, and, on the other, that the structure comes from the replaced schist. Quartz is often present. Barite is absent.

The ore bodies are cut by small transverse faults, their sides occasionally polished by movement since the ore was deposited. In the Iron Mountain district the ore separates easily from the wall rock, and at many points there are considerable masses of sericitic selvage, but none so large was seen as in the Bully Hill mine. The wall rock on both sides of the Hornet is quartz keratophyr, which, according to Hillebrand's partial analysis, contains 5.16% Na₂O and only .30% K₂O, with .015% BaO and 74.52% SiO₂. It looks quite like quartz porphyry, but differs especially in containing more soda. It seems to be related to the soda rhyolites, described by Palache, near Berkeley. Over 700 tons of ore yielded an average of 7½% copper, with a range of 1% to 20% copper.

Shasta King: At the northern end of the Iron Mountain district is the Shasta King mine, which is rapidly developing and is about to erect a smelter. The ore body is in the form of a sheet, with its greatest dimension north and south, dipping gently to the westward, in strong contrast with the other ore bodies of the district. A selvage of sericite, from a mere trace to nearly a foot, generally separates the ore and country rock. At one point upon the upper side the ore appears to be "frozen to country rock," but this is exceptional. Near the surface a well-marked gossan of limonite, like that of Iron Mountain, prevails, but is less extensive, on account of the steep slopes.

The ore is almost wholly pyrite and chalcocite, with some sphalerite.

Balacala: A short distance south of Shasta King and 1000 feet above it is the Balacala. In both cases the rock appears to be keratophyr, generally quartz-bearing, and the ore bodies strike nearly parallel; but at Balacala the dip is steep to the west. The ore body, which consists chiefly of pyrite, with some chalcocite, although irregular, is large and dips nearly parallel to the slope of the ravine, so that short tunnels reach the ore. Gossan is rare on the steep slopes, but farther northeast, where the mine was first opened, on a gentle slope east of Shasta King, gossan rich in limonite is prominent. Upon the borders of the ore bodies small nodules more or less lenticular occur in the schistose quartz keratophyr, and appear to illustrate in a small way the relations of the large ore bodies. They are composed of pyrite and have no selvage. King Copper, Spread Eagle and a number of other claims in the same district are rapidly developing. In the Bully Hill and Iron Mountain districts great depths have scarcely yet been reached, but enough is known to suggest that secondary enrichment has played an important role in these deposits.

Gasoline Engine and Dynamo.

TO THE EDITOR:—In "Concentrates," July 19, regarding the running of a dynamo by a gasoline engine, you recommend that there be provided a heavy balance wheel or a countershaft with a heavy pulley upon it, and that it would probably run steadily enough for such a purpose.

Some fifteen years ago I had occasion to install an incandescent plant of twenty-five sixteen candle power electric lights in a Chicago restaurant. The power was furnished by gas engine, 140 revolutions per minute, the dynamo 2300 per minute. I first tried the heavy balance wheel on the engine. The impulses due to the explosions in the gas engine showed very plainly in the lights. I then introduced the rope transmission system, using a heavy pulley on the take-up carriage. This proved no better than the first method. Finally I placed a heavy balance wheel on the dynamo, on the armature shaft. The wheel consisted of a hub, from which to the rim in place of spokes the web was solid, about ¾ inch thick, and accurately balanced. This wheel was 26 inches diameter. A heavy rim added 4 inches to the radius and was 3 inches thick. As the dynamo had 2300 revolutions per minute, every impulse of the engine, which was belted direct, was absorbed by the balance wheel at its high speed, and perfectly steady lights resulted. The higher the speed the less the impulses will interfere with the regularity of that speed under these conditions.

“Miners’ Wages in Mexico.”

TO THE EDITOR:—One sees so much printed in regard to Mexico that those who are familiar with the conditions of the country know to be erroneous that it is impossible at times to let the error go uncorrected.

Under the above caption is found an article in the MINING AND SCIENTIFIC PRESS of June 28, 1902, copied from an Arizona paper, that conveys much information that is, to say the least, misleading; and I speak from the standpoint of a seventeen years' residence in the country, in the States of Chihuahua, Sonora, Sinaloa and Durango.

Why the Mexican miner receives in silver about what the American receives in gold is due to none of the causes mentioned in the copied item referred to, but is due to the fact that prior to the establishment of works by foreign companies the native, as a rule, had been accustomed to a salary of 25 cents a day, in goods, in the agricultural districts, and to \$1 per day, in store supplies, in the mining districts; so that when the new works are started up and the pay is raised to \$2 and over, and often the whole or half in cash, the native thinks he has fallen into the seventh heaven, as it were, and is content, even if foreigners get double for doing the same work.

The ethical side of the question is liable to be insisted on by the foreign manager upon first coming into the country and learning how the workers are treated by their native employers.

The conditions are entirely different from what one finds in almost any other country in the world, and the people—the working classes—are the most peaceable and easiest satisfied of any similar class on earth.

The climate is such that the native needs but little besides his food and the simplest of clothing. He is very poor, accustomed to live in a hut with no furniture and but the scantiest of kitchen service, and, prior to the coming of the foreign company, putting up with the scantiest amount of food, mostly corn, beans once in a while, and, less often, beef.

In justice to the country I will say that these conditions are gradually disappearing, even where the works are owned by natives.

What is the wonder, then, if under the new conditions the native miner is enabled to live as he never dreamed of before, that he is contented, even if others do get more?

Having been raised with no wants, the present generation does not know what to do with the great (to them) surplus earned under the new conditions; for it is a well-known fact, to those of us who are familiar with the people, that when the native finds himself with money to spare the last thing he thinks of is getting something of use to his family, saving it or supplying himself with something a foreigner would consider indispensable. If the surplus is not spent in debauching, our native buys himself a gold-trimmed “sombbrero,” a revolver, or some other such piece of furniture.

Viewed from the ethical standpoint (and I say so after a most intimate association with the subject, having worked him successfully both for Mexican and foreign companies), every cent paid the native workman of the present generation, over and above the actual needs of the day, really does him an injury, in that it foments latent vices that in a very few years ruin the man whom we have started out to better.

I call to mind several cases, in my own experience, where I have taken special interest in bright young fellows who by their work forced themselves upon my notice. Some of them I pushed ahead until they were earning \$4 per day, and invariably it was their ruin. Instead of saving, as one would expect, it would not be long before they would be spending their salary and working their credit to the limit—gambling, drinking and all other excesses. The result was that in two years they were worthless.

In each of these cases the men were all that could be expected as long as they received good living pay, or say about \$2 silver per day.

The fact is that in an experience of nine years as a mine manager, using natives exclusively, I only call to mind two who saved money out of their wages.

In all my experience I have yet to call to mind a single case where the company had to pay a cent—involuntarily—for a man killed, or to his relations. The authorities, it is true, take due cognizance of the accident; but where it is a case of pure accident that could not have been avoided unless the victim had stayed out, no fine is ever imposed, nor do the families ever demand anything. However, companies that I have been connected with have always done something for the family; though, even then, \$100 is the largest amount I call to mind as having been paid.

Perhaps the Green Co. has some special contract with the Mexican Government, otherwise I very much doubt the Government's fixing the rate of wage to be paid to the native miner. That statement is contrary to my experience, as I call to mind no such interference, and I have been connected with some of the largest mining companies in the country.

The native workman is, as a rule, one of the most peaceable of mortals; and although he frequently, when under the influence of mescal, will think he is

the best man on earth, and sometimes get killed for entertaining that idea, nevertheless, it is a well-known fact that he is never a revolutionist. He is a follower in that line, as he is in every other; he is never a leader.

The average Mexican miner will drill, in ordinary rock, 8 feet of holes in a shift, for which he will get about \$2.

The class of American miners that can be gotten on the immediate frontier are the equal of those to be had in the interior of the United States, and no doubt are superior to the average native; but my experience has been that the miner to be had along the west coast is a good man to keep out of your mine if you have a full crew of natives.

In nine cases out of ten where we have put the more intelligent (?) foreigner in charge of a piece of work, instead of taking hold as he would have to in the States, he does little, and, if allowed, will soon press one or more of the natives under him to wait upon him, which the native will do without questioning, so used is he to obey those over him.

Where foreign companies will confine themselves to good, high-class foreign foremen who speak the language and use natives elsewhere, paying a reasonable wage in silver, they will get along far better than by trying to use foreign labor entirely.

A fact that will ere long confront industrial enterprises in Mexico will be the lack of native labor of any kind to supply the demand; and it will not be many years before recourse will have to be had to immigration, and the Chinese seems to be the one most adapted to the country at present.

E. A. H. TAYS.

Identification of Metals of the Platinum Group.

Sodium peroxide at a dull red heat is the most suitable reagent. The metal, which should be in an extremely finely divided state, is mixed with five or six times its weight of sodium peroxide and gently heated in a nickel basin over a low gas flame. The mass first blackens and then becomes pasty, after being stirred with nickel spatula, and the heating continued, it becomes semi-liquid. The flame is withdrawn, and the cold contents of the basin treated carefully with water in the proportion of about ten to twelve times the weight of sodium peroxide used. The mixture is transferred to a tube, and after standing, the clear liquid is decanted, and the deposit mixed with water and collected on a filter. The oxide of nickel found will be in this deposit, and if insoluble oxides of insoluble alkaline salts of the platinum group are also present it can be readily separated from them by means of the nitrate method. The separate metals treated with sodium peroxide

in this way give the following results:

Osmium is completely converted into sodium osmate, which dissolves in water yielding a yellow solution. On passing a current of chlorine through the solution, slightly heated, osmium peroxide can be collected in a receiver immersed in ice water. This compound may be identified by the formation of potassium osmate (action of potassium nitrate on heating or of alcohol and potassium hydroxide in the cold).

Ruthenium is completely converted into sodium peruthenate, which in the presence of water yields the ruthenate. The latter forms an orange solution which on treatment with chlorine gas as above yields a yellow liquid, in which ruthenium peroxide may be identified by the reduction of ruthenium on treatment with caustic potash and alcohol in the cold, or by the formation of a brown sesquichloride, by the action of hot hydrochloric acid.

Palladium gives an alkaline palladate soluble in water. On neutralizing the yellow solution with hydrochloric acid and then evaporating it after addition of chloride of potash and nitric acid, ruby red crystals of potassium chloro-palladate, insoluble in a saturated solution of KCl, are formed.

Iridium is converted into hassic irridate, which on treatment with water yields a blue solution. On adding a slight excess of hydrochloric acid to this solution, and evaporating after the further addition of KCl and a little nitric acid, black crystals of potassium chloro-iridate are obtained. These are also insoluble in a saturated solution of KCl.

Platinum is converted into the insoluble sodium platinate which remains on the filter with the nickel oxide. The precipitate is dissolved in strong HCl, the greater part of the acid subsequently evaporated and sodium nitrate added until the liquid is neutral, then sodium carbonate, and the liquid boiled and filtered. Nickel carbonate remains on the filter, whilst the filtrate contains the double nitrate of platinum and sodium. On evaporating this filtrate to dryness, after adding HCl, the residue is dissolved in water and treated with ammonium chloride, it gives the characteristic crystals of ammonium chloro-platinate.

Rhodium is converted partially into dioxide, soluble in hot concentrated hydrochloric acid, and partially into sesquioxide, remaining undissolved. The filtrate obtained by treating the mass with hot concentrated hydrochloric acid will also contain the nickel. It is treated in the same manner as the platinum solution and filtered with the nickel carbonate. On heating the filtrate with an excess of hydrochloric acid it becomes rose-colored from the formation of the double chloride, but does not yield a precipitate with ammonium chloride. — Bulletin Soc. Chem., XXVII.

Automatic Dumping Device.

Occasionally "Concentrates" is asked a question that no amount of compression or boiling down of the requested answer will permit of its appearance on that page. Of such a nature is the following:

As a subscriber and an admirer of your paper it has occurred to me that "Concentrates" may be willing to furnish a pointer in a matter which has stumped me for some time. The question is this: On my prospect I am hoisting in a 73° incline with buckets (No. 6), the hoister being a No. 1 Davis whim. My gallows-frame is of the tripod style, the two front standards being perpendicular, as shown in sketch. From the shaft collar to the sheave there

is 11 feet clearance, and what I want to know is how to rig up some kind of an apparatus with which to dump the buckets automatically. Up to the present we are lowering the buckets to the ground in front of the incline, disengaging the safety hook and chain and dumping the buckets by hand, and we find it slow and laborious work. If "Concentrates" can help me out with any practical suggestion in the line asked for I shall appreciate it very much.

Ocotlan, Oaxaca, Mexico, July 1, 1902. T. G. F.

Having the tripod hoisting frame renders our Mexican prospector's problem more difficult of solution than with any other type of head frame. The accom-

panying sketch may be of some assistance to him, being merely suggestive, as all the conditions and dimensions are not known. By extending the skids of the shaft upward, as shown at D, and arranging a door or apron over the shaft, as at G, the bucket may be dumped upon the door, as at C. M is a trip rope or chain secured to the back brace of the frame B. F is a cross piece secured to the triangular legs of the frame A, and upon this the apron rests when down. After dumping the bucket, the contents of which fall into the car K, it is hoisted up to the sheave, as at C, the trip hook N disengaged, the door thrown back to its position H, swinging on a strong hinge P. When in this position the door rests upon L, which is supported by two posts I, between which the car track is laid. J is a back brace supporting this frame. The labor of moving the door in either direction may be lessened by attaching a counterbalance, the rope passing over a small wheel

attached to L. The back brace Q is to give support to the extension skids D. The entire scheme is operated by a man standing on the platform O, which is secured to I, D and R, the latter being a cross piece resting on two posts S. Should the diameter of the bucket be too great to pass F, a block may be placed between A and F, but this will require a longer door and the bottom of the bucket may not clear it when hoisted as high as it will go. A larger sheave would help in this case. The above is figured on a bucket having a height of 28 inches. If necessary, the door may have side guides to keep rock from falling into the shaft, which must be avoided at any cost. A low car must be employed, as the height of the bottom of the door is but 3½ feet above the collar of the shaft. If the hoisting gear were placed on the foot wall side of the shaft, and the entire frame turned around, the above scheme might be made to operate successfully, dumping on a flat platform, under which the car may be run.

Drilling for Gold Dredging.

Written for the MINING AND SCIENTIFIC PRESS.

I would recommend a 4 H. P. boiler and engine—upright preferred, steel boiler capable of carrying 100 pounds of steam, iron wheels, extra wide tires, to admit of being drawn on wet or marshy ground, total weight about one ton. If found necessary, engine can be detached, also boiler; nothing less than a 6-inch bore to be drilled, driving stem to weigh, with drill, not less than 700 pounds. For ordinary purposes a 22-inch stroke answers well, with from forty to sixty strokes per minute. Casing should be 6-inch, extra heavy, with special coarse threads, ends of all casings cut perfectly true in a lathe, so that the blow will come against the ends of casing instead of on the thread. The casing should be cut in 5-foot lengths, and there should be plenty of couplings, so that in case of one getting bruised or lost another can be quickly replaced. A special steel drive shoe is necessary, with taper shoulder, so as not to catch when being withdrawn. A square shoulder will catch against the edge of a rock and cause trouble in getting it out. The best steel should be used for making the drive shoe.

It is important in drilling to keep the casing well down, and this sometimes requires hard driving, but with a good drive shoe and good, strong casing and good threads no trouble will be had. For all ordinary work 40 feet of casing is sufficient. There should be four drills, plenty of the best rope, with a good tackle block, using ¾-inch rope. This is especially useful in drawing casing. A good sand pump with special independent drum and friction for working the pump are essential, so that the drill can be taken out and the well pumped out in a few minutes. A box of 2-inch plank, 4 feet square by 1 foot deep, is well adapted for holding the material as it is pumped out. This should be fastened to runners, thus making a store box for transferring tools, etc., from one place to another. A

12-inch fan should be attached to the outfit, to be driven with the engine, and a piece of 2-inch rubber hose for blowing the fire when sharpening the drills. With this fan and hose a good fire can be made by digging a hole in the ground and using wood or coal; plenty of heat can then be had for tempering heavy drills. An anvil should also be included, and a good sledge, a good machine hammer, a claw hammer, plenty of good chains of the best quality, saws, chisels, blacksmith tongs, and a few pieces of wrought iron and tool steel, 50 feet of best quality ¾-inch hose, extra injector, different sizes of machine bolts, nails and screws, two good jackscrews, crowbars, a piece of good, hard wood suitable for pins, handles, levers, etc., a five-gallon can of machine oil and some cylinder oil, two galvanized pans and one tub. Three good men will drill a hole in two days on an average, and do all the necessary moving, and will thoroughly prospect a good-sized claim in a few weeks.

CALIFORNIA's average annual gold output for the last fifty-three years has been about \$25,000,000.

The Pachuca Stamp Battery and Its Predecessors.*

M. P. BOSS, Pachuca, Mexico.

Of the two methods of mechanical reduction—that of percussion and that of abrasion—it is not easy to say which was first employed by primeval man. The stone hammer and the flat or hollowed stone used for grinding are found together in the remains of prehistoric periods. But the use of the mallet, or bucking stone, developed from the hammer, was probably introduced later than that of crude millstones. Diodorus Siculus, the Roman historian of the first century B. C., mentions such millstones as used in the mines of Egypt to pulverize material which had been previously broken in a mortar.

The invention of the arrastra for fine grinding is declared by some authorities to have been made by Bartolomeo de Medina, at Pachuca, Mexico, about A. D. 1557, which is quite probable. Being the first to amalgamate silver on anything like a business scale, he must have felt the necessity for ore grinding apparatus of greater capacity than the old primitive millstones, and the arrastra was thus the natural successor of the millstone.

It is very unfortunate that the archives of Pachuca, which have made so much history in ore treatment, were destroyed in some one of the many insurrections for which, also, the place is renowned.

The first application of the stamp to the crushing of rock is asserted by some writers to have been the invention of a Saxon nobleman named Von Maltitz, about the year 1505. Better authenticated reference, however, is made to one Paul Gronstetter, a native of Schwarz, and called an ingenious worker, who, in the year 1519, established at Joachimsthal a process of wet stamping and sifting. Two years later a larger plant was established at the same place. It is said that he had previously introduced the same device at Schneeberg. How much of the invention was due to Gronstetter is not certain; but it certainly seems that he was the first successful operator, and that it rapidly came into extensive use, as a direct result of his operations.

Whether the stamp mill was then practically as we find it profusely illustrated in the work of George Agricola, some years later, or whether it had been further developed by other hands in the interim, we are not informed. But for more than 300 years the stamp continued to be a square timber (except in a few instances where square iron was used) with an iron shoe at the lower end. In this form it came to crush the first gold ore of California.

As soon as stamps began to fall on California gold quartz, brains began to work for their improvement. There was in those days so little system and so much crudeness of construction, as well as secrecy of methods, that the early improvements can be traced with difficulty. Previous to the general adoption of the round revolving stamp, numerous departures had been made from the original imported type. One style came into vogue in the territory around Marysville, Cal. It was square, and had two stems, driven with a taper into the head, and the rectangular tappet was held by cross keys, one for each stem. The stems were cross-slotted to engage the keys. Some of these stamps weighed as much as 1000 pounds each. The shoes were held by a square taper shank.

An article of considerable fullness, by C. P. Stanford, in the San Francisco MINING AND SCIENTIFIC PRESS of October 21, 1893, shows conclusively that that gentleman was the inventor of the round stamp; but it was not made to revolve until this feature was suggested by Isaac Fisk, an engineer in his employ.

The United States patent granted July 4, 1854, to Joseph L. Laird, for an improvement in ore stamps, claimed "the arrangement of the lifters by being so placed as to operate on the periphery of the tappet head for the purpose of giving the stamps a partial rotation without requiring other mechanism in the manner set forth." This inventor very likely found his patent invalid for lack of novelty. At all events, no instance can be found of his claiming royalty for the thousands of stamps which were in use, with this improvement, during the life of the patent.

After the introduction of the round stamp, Zenas Wheeler devised a means of holding the tappet by screwing it upon the stem. Later, when having a large stamp mill built at the Miners' Foundry of San Francisco, he accepted the advice of H. B. Angel and had it made with a gib and two cross keys in the tappet. Years later, Irving M. Scott cast the gib into the tappet, making it shorter and entirely enclosing it at the ends, thereby securing it against maladjustment, as well as simplifying its construction.

In 1857 Samuel J. Black, complaining of the faultiness of all cams hitherto made, requested H. J. Booth of the Marysville Foundry to make a cam that would at all times bear only on a diameter line of the tappet parallel with the cam shaft. Mr. Booth got the lines for such a cam by means of a board revolved upon a center corresponding with the cam shaft center, locating his points with a dummy tappet, working upon a slide. Of course, this gave practically an involute curve. The first double-arm cam, made as they are to-day, with the hub on one side, to

*Trans. Am. Inst. Mining Engineers.

bring the stamp nearer to the shaft, and laid out as an involute, was designed by Irving M. Scott.

The high box mortar is thought by some to be due to Zenas Wheeler; but positive information on this point is unattainable. Nor is it to be ascertained to whom is due the introduction of the long battery foundation blocks, set on end.

This outlines the evolution of the world-famous California stamp battery. It has continued, and still continues, to undergo a gradual refinement of detail, and it has become cosmopolitan.

Judged from the standards of the present day of technical schools and highly developed mechanics, the evolution of the California stamp seems but a trivial and simple matter; but at that time it was an important step up the ladder of progress.

Sixteen years ago the writer became an advocate of concrete foundations and low-set guides for stamps and three years later took the opportunity to apply these principles to the original Hacienda de San Francisco de Pachuca.

This first foundation, however, was not an unqualified success, the concrete having been insufficiently rammed; but it was a guiding star for the erection of the new Hacienda de San Francisco, built at Zotol. This mill began crushing ore May 1, 1894, has been in practically constant operation ever since and has made a record in some respects very remarkable. It was built with twenty stamps, and in the following year increased to thirty stamps. During these seven years only four stems all told have been broken and one renewed, and the stems are not seriously worn in the guides. The stamps, when new, weigh 1040 pounds each, and make 102 drops per minute. Each stamp has therefore dropped about 450,000,000 times without renewal of stem or guide.

For this result I assign three causes: 1. The long stamp head and low guide prevent severe wrench to the stem when the stamp strikes hard at one edge of the shoe. 2. The solidity of the concrete foundations keeps the jar and vibration of the iron work at a minimum. 3. The iron guides give the stem but little play.

At the Hacienda de San Francisco, now running, the concrete was laid upon solid bedrock, and was 9 feet in depth and 9 feet in width. It was very thoroughly rammed as laid. On a hard bedrock there is no necessity for deep concrete, except to secure the required height—in fact, no foundation could be better than a solid, unfailing granite bedrock, with only a thin sheet of rubber or canvas between it and the mortar. With a mortar having a fairly thick bottom, this would make a perfect anvil for the blows of the stamps.

The top of the stamp head in the San Francisco is only 2 inches below the lower guide when the stamp has new shoe and die, and is raised 6 inches for drop. This, of course, requires that the housing shall be around the stamp head instead of around the stem, which is easily effected with a long stamp head.

Guides of iron themselves wear so little, and also wear the stem so much less than wooden guides, that they are beyond comparison better. For example, how thick would a stem be, after running seven years in wooden guides, without repairs or alteration in length? The reason that wooden guides wear the stem so much faster than iron ones is that they accumulate grit, whereas an iron guide becomes smooth and polished.

Sulphur.

The production of sulphur in the United States during 1901 was 7690 short tons, valued at \$223,430, which was derived from Nevada, Idaho, Utah and Louisiana, in the order of the importance of their output, according to the report of Dr. Joseph Struthers in "Mineral Resources of the United States, 1901," now in press, U. S. Geological Survey. A comparison with the production during 1900 of 3525 short tons, valued at \$88,100, shows an increase during 1901 of 4165 tons, or over 118%, in quantity, and of \$135,330, or over 152%, in value. It is worthy of note that Nevada and Oregon returned to the list of producing States during 1901. The production of sulphur in the United States during 1901 is the largest annual record ever made, and yet the domestic production has always been of insignificant proportions as compared with the total consumption of the country. The quantity of sulphur consumed in the United States from foreign and domestic sources in 1901, including the sulphur content of iron pyrite, which is used in the manufacture of sulphuric acid, amounted to 525,745 short tons.

The use of iron pyrite in the manufacture of sulphuric acid has shown a remarkable increase since 1891. The sulphur content of the iron pyrite used in that year was 93,233 long tons. In 1901 the sulphur content of the imported pyrite amounted to 181,668 long tons, and that from the domestic production of pyrite was 105,671 long tons, a total production of 287,339 long tons, or more than three times the quantity consumed in 1891. This use is increasing steadily. By far the greater part of the sulphur consumed in the United States is used in the manufacture of paper pulp by the sulphite process of treating wood pulp.

The imports of sulphur into the United States in

1901 was 175,210 long tons, valued at \$3,287,906, as compared with 167,696 long tons, valued at \$2,941,888, in 1900, and with 140,701 long tons, valued at \$2,523,203, in 1899. The estimated total domestic consumption of sulphur was 469,415 long tons in 1901, as compared with 408,038 long tons in 1900, with 345,904 tons in 1899, and with 211,491 tons in 1891.

Spot prices for Sicilian sulphur, per long ton, ex steamer at New York, ranged in 1901 from \$20.75 in April to \$23.25 in December.

The world's production of sulphur in 1900 was 577,420 metric tons, valued at \$10,698,494, as compared with 586,122 metric tons, valued at \$10,844,688 in 1899.

Pyrite.

The production of pyrite in 1901 was the largest yearly quantity yet recorded, amounting to 234,825 long tons, valued at \$1,024,449. A comparison with the production during 1900 of 204,615 long tons, valued at \$749,991, shows an increase in quantity of 30,210 long tons, or 14.8%, and in value of \$274,458, or 36.6%. The greater part of the output was derived from Virginia, Colorado, Massachusetts and New York, named in order of production. Ohio contributed 7585 long tons of pyrite, obtained as so-called "coal hases" from the coal mined in that State. No pyrite was reported in 1901 from North Carolina, which in 1900 produced 5000 long tons. No new mines of importance were opened during the year, although development work was carried on in localities which have long been known as probable producers, notably in New York, Virginia and North Carolina.

In addition to the large increase in the production of pyrite in the United States during 1901, there was a very large increase in the quantity of pyrite imported, the imports for 1901 being 403,706 long tons, valued at \$1,415,149, as compared with 322,484 long tons, valued at \$1,055,121, in 1900, an increase of over 24% in quantity and over 34% in value. The consumption of iron pyrite in the United States in 1901 was 638,531 long tons, as compared with 527,099 long tons in 1900, with 44,602 tons in 1899, and with 207,184 tons in 1891.

The quantity of sulphur displaced by pyrite for acid making is estimated at 287,339 long tons in 1901, 237,195 tons in 1900, 200,071 tons in 1899, and at 93,233 long tons in 1891, an increased displacement of over 200% in the eleven years from 1890 to 1901, inclusive. In addition to the development of the sulphite wood-pulp industry for paper manufacture, the increased production of phosphate rock in Florida and Tennessee and the corresponding increased domestic manufacture of sulphur phosphates has increased the demand for iron pyrite, since for the purpose of these manufactures the sulphuric acid made from iron pyrite answers as well as the purer acid made from sulphur. Notwithstanding the large increase in both the production and the imports of pyritic iron in 1901 the price of the domestic product advanced from \$3.67 per ton in 1900 to \$4.36 per ton in 1901, and the price of the imported pyrite advanced from \$3.27 per ton in 1900 to \$3.51 per ton in 1901.

According to the latest available figures, the world's production of pyrite in 1900 was 1,640,979 long tons, as compared with 1,552,039 tons in 1899, and with 1,082,808 tons in 1892. The corresponding displacement of sulphur was 738,440 long tons in 1900, 648,418 long tons in 1899 and 487,263 long tons in 1892.

Alaska-Treadwell Costs, Etc.

TO THE EDITOR:—I have read in several papers that there is a cut of 34 cents per ton in the cost of reduction of Alaska-Treadwell ore. What can you tell about it? We naturally look to the MINING AND SCIENTIFIC PRESS for such information first. Can you give some details in general as to what is being done on Douglas Island, Alaska—costs, treatment, etc.? E. E. S. Silverton, Colo., Aug. 1.

Considerable has been furnished our readers on this subject right along. On page 20 of the issue of July 12 appears some recent data. The item referred to by our Silverton correspondent was noted, but so far the statement is not verified. Judging by the monthly reports, no material reduction in costs has taken place in the Treadwell mine of late. The mills are, however, crushing 45% more ore than they were in 1899, when the cost was 78 cents per ton. It is believed that the present management is an improvement on the old. Everything is, as generally known, on a large scale. About 1,000,000 pounds dynamite were used last year.

In the month of June the 240-stamp mill ran 30½ days, the 300-stamp mill 30½ days; 89,654 tons ore were crushed; the estimated realizable value of the bullion was \$76,929; there were saved 1562 tons sulphurets, of an estimated realizable value of \$74,878, the working expenses of the month were \$65,355.

Figuring from that data, the total June yield was \$151,807, a profit of \$86,452; cost per ton of crushing, 73 cents; yield per ton, \$1.70; tons crushed per stamp per day, 5.4; profit per ton, 97 cents; sulphurets saved, 1.74%.

Reformed Copper Ores.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by J. C. GOODWIN.

I will not attempt to discover to you the origin of these ores nor will I endorse any of the theories by geologists or mineralogists. Some advocate the theory that the original deposits of ore were deposited from solutions deposited by lateral secretions; by others that it came from a great depth in an aqueous, alkaline, or acid solution, and were deposited as sulphide, or molted magma, etc. By studying and examining many ore bodies as I have found them in many formations, I am convinced that the kind of ore originally deposited depended to a great extent upon whether the rock in which it was deposited was an acidic rock, or basic. The kind of rock in which the ores were originally deposited not only gave character to the ore, but caused ores of various minerals to be deposited in the same vein. That is the character of the country rock, or the walls of the veins or deposits had great influence upon the original ores, and as the ores were breaking up or being decomposed by oxidation. The country rock causing the solutions that were formed to be alkaline or acidic, gave character to the new bodies of ore that were being redeposited. I shall attempt to prove my assertion by comparing the conditions of the original and reformed ores found in the many great mines.

In the Bisbee mine all the ores that were originally deposited on the contact or near the contact in the rhyolite were sulphide ore and all ores that were deposited higher up in the limestone were carbonates, except the great bodies of manganese. They were deposited as sulphides; the iron that was associated with the manganese was also deposited as a sulphide.

The reason for believing that the manganese and iron were deposited as sulphides is that the solution containing the iron and manganese as sulphides was an acid solution, but this solution on coming in contact with the calcium carbonate was not only neutralized, but was changed into an alkaline solution and from this alkaline solution the iron and manganese were deposited as sulphides. I have found on examining various deposits of manganese that they were associated in nearly every instance with calcium carbonate (unless hog manganese), if they carried silver, copper, etc.

Some of the silver mines of Tombstone contain great bodies of manganese in cavities in the limestone. There is associated with the manganese in these deposits silver and lead sulphides, and in one mine, the Lucky Cuss, under a granite tongue where it was best protected from the elements, was found manganese sulphides associated with the sulphides of iron and silver. I believe that this deposit of manganese as well as the deposits of manganese found in and about the Copper Queen mine, as well as other places, were originally deposited as sulphides. The reason that manganese is seldom found as sulphide is because it breaks up if acted on by air and moisture and forms other and more stable compounds, such as the oxides. In these large beds of manganese at Bisbee are found cavities in the form of geodes, the ores of these geodes being the beautiful ores of malachite and azurite.

I am indebted to Prof. W. P. Blake, Director of the School of Mines of Arizona, for the information in regard to the conditions under which the manganese sulphides ores are found in the Lucky Cuss mine at Tombstone.

The first great bodies of ore that were found in the Copper Queen were the oxides, and carbonates of copper. The Copper Queen Co., as well as other copper mining companies, were searching for carbonate and oxide ores. Little was known about the sulphides as an ore twenty years ago, and when encountered they were looked upon with disfavor, and this is one reason why the bodies of sulphides ores were not then explored. There is some contention among the mining men as to whether the carbonate and oxide deposits at Bisbee are deposits of fissure veins.

Prof. Arthur F. Wendt says of the carbonate and oxide deposits: "The ore beds mined in limestone traced upward are completely filled with calcite, a reason why the ore bodies are fissure veins and not ore beds."

I have found at Bisbee, on examination, that many fissure veins filled with calcite cut the limestone at right angles to the bedding of the limestone. By sinking on these fissure veins it has been found that some have led to ore deposits in limestone, while others have passed through the limestone, to the sulphides hundreds of feet below the surface. This proves that the vapors and hot water passing up through the various fissures dissolved out cavities in some of them, while in others it did not, and it also proves that the material which filled these cavities came from below, and that the great sulphide bodies of ore found on the contact between the felsite and limestone were being deposited, perhaps from a molted magma, at the same time. The deposits of the carbonates and oxides of copper now found high up in the limestone perhaps were mostly deposited as sulphides, but in the deposits of manganese ore all the original ore has been decomposed and reformed.

(TO BE CONTINUED.)

Mining and Metallurgical Patents.

Patents Issued July 29, 1902.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

HOT BLAST FURNACE.—No. 705,640; E. T. Bradford, Denver, Colo.

Hot blast furnace, provided with blast heating pipes located within furnace adapted to conduct blast from upper and cooler to lower and hotter portions of pipes, tuyeres connected to hotter end of heating pipes, blower mechanism for supplying air to cooler end of heating pipes, non-conducting refractory lining in portion of furnace surrounding heating pipes, portion of heating pipes within refractory lining consisting of series of horizontal pipe sections arranged in zigzag order, supported on transverse supports, series of substantially similar U sections provided with flanges, secured to horizontal sections at flanges.

REDUCTION OF METALS FROM THEIR ORES, ETC., IN ELECTRICALLY HEATED FURNACES.—No. 705,651; R. C. Contardo, Sevres, France.

Process herein described of obtaining metal direct from the ore consists in subjecting ore to high temperature solely by radiation and convection from voltaic arc, and simultaneously causing current of reducing gas containing carburizing agent to flow through the ore, whereby approximately exact amount of carbon desired may be combined with the iron.

SWEEP OPERATED HOISTING WINDLASS.—No. 705,880; E. R. Storrs, Cripple Creek, Colo.

Combination with rotary power table having concentric gear tracks, of separated bearings located on opposite sides of center of rotation of power table, shaft journaled in bearings, winding drum secured on shaft intermediate bearings, guide wheel loosely journaled on one end of shaft, adapted to bear against

table between gear tracks and pinion slidable longitudinally on shaft, adapted to turn therewith, which is arranged to mesh with any of gear tracks.

CYANIDE PROCESS OF WORKING GOLD, SILVER OR OTHER ORES.—No. 705,698; R. H. Officer, J. W. Neill, J. H. Burfeind, F. H. Officer, Salt Lake City, Utah.

Improvement in cyanide process of recovering precious metals from ores, slimes, tailings or concentrates, consisting in treating ore, slime, tailings or concentrates with suitable cyanogen compound passing hydrocyanic-acid gas set free by such treatment through regenerating caustic solution, then filtering and washing to recover metals precipitated by acidification, using gas after passing through regenerating solution to agitate fresh quantity of pulp.

METHODS OF TREATING METALLIC OXIDES IN THE PRODUCTION OF METALS AND ALLOYS.—No. 705,727; F. C. Weber, Chicago, Ill.

Placing the to-be-treated charge, comprising aluminum in admixture with metallic oxide reducible by aluminum, in crucible, subjecting same therein to drying and preparatory treatment by electric heat at time reaction is to be undergone, for preparatory treatment to eliminate moisture, break up molecules containing water of crystallization and drive off water of crystallization and bring charge into condition for reaction, then raising temperature to degree sufficient to effect reaction and adding to intensity of reaction temperature, temperature of preparatory heating, thereby increasing effective heat by added caloric of preparatory treatment.

CRUSHING AND PULVERIZING MILL.—No. 705,870; J. F. Sanders, Boise, Idaho.

Combination of rotatable cylinder or drum, longitudinal bars set apart to leave spaces or interstices between them and forming body of cylinder or drum, supporting heads one at each end of cylinder or drum receiving and retaining ends of bars, rotatable tubular shaft on which cylinder is mounted, holes or perforations in shaft within cylinder, water supply pipe entered into one end of shaft, discharging water therewith and escaping water through holes into interior of cylinder, openings in head of cylinder, funnel or hopper attached to head having openings revolving therewith, receiving therewith ore for depositing ore within interior of cylinder, means for crushing

ore within cylinder, subject to action of discharged water from tubular shaft, an amalgamating plate located beneath cylinder, receiving thereon pulverized material discharged through spaces of cylinder, cam wheel engaging end of amalgamating plate, shaft on which cam wheel is mounted, power connection between shaft of cam wheel and tubular shaft for revolving cylinder and reciprocating amalgamating plate from common source of power.

CORNISH ROLL.—No. 705,749; A. J. Gates, Chicago, Ill., assignor to Allis Chalmers Co.

Combination of roll shaft, thrust collar provided with annular flange in threaded engagement with one end thereof, gib key engaging slot formed by and in threaded portions of roll shaft and thrust collar for holding such parts in desired position, ring nut surrounding thrust collar having one end in threaded engagement with frame of machine for adjustment thereof, plate nut in threaded engagement with other end of ring nut to complete closure for and confine thrust ring, means for holding plate nut in adjustable engagement with ring nut, means for holding ring nut in adjustable engagement with frame, wearing ring interposed between ring nut and annular flange of thrust collar, and wearing ring interposed between plate nut and annular flange of thrust collar.

PROCESS OF MAKING THE INTERIOR OF COKE OVENS OR OTHER KILNS TIGHT.—No. 705,681; R. Kuhn, Bruch, Germany.

Process of making interior of coke ovens and other kilns tight, consists in mixing fine ore dust with fine ground ashes or other dusty material, then blowing mixture into hot chamber, walls or sides of which are intended to be tightened, effect being that dust will keep floating for a while, then settle by degrees in pores and cracks and thereby make walls perfectly tight.

TREATMENT OF STEEL INGOTS FOR FORGING.—No. 705,330; C. T. Dudley, Golden, Colo.

Process of treating cast-steel ingots and the like previous to forging, which consists in cooling cast ingot to temperature below 550° C., reheating cooled ingot to temperature between 750° C. and 850° C., maintaining reheating temperature for period of from thirty to forty-five hours, finally heating ingot to forging temperature.

The Bosworth Crusher.

The Bosworth crusher, illustrated herewith, is a

crusher for laboratory use designed for either hand or power. Its capacity is fifty pounds per hour, the largest piece of ore so crushed not to exceed 1½x1½x2½ inches. There are fifteen parts to it, any one of which can be furnished by its makers, the Denver Fire Clay Co., 1742 Champa street, Denver, Colo.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

On Resurrection creek, near Hope, the R. C. A. M. Co., operating the property, has laid 4100 feet hydraulic pipe, installed an Evans hydraulic elevator, constructed a wingdam so that work could proceed in the original bed of the creek. Sinking with the elevator began June 28, bedrock to be reached in 25 feet. The creek has been worked by miners for a long time with pick and shovel and sluice-boxes, but owing to the immense amount of seepage water it was impossible for the miners to sink and work over 7 feet from the surface, the top gravel yield averaging \$2 per yard. The creek is 25 miles long and presents this condition: 8 or 10 feet of loose top gravel; under this and acting as a sort of bedrock is found clay, ground up or pulverized slate, rimrock and quartz, deposited by glacial action; this in thickness from 2 to 8 feet. Beneath this glacial clay or so-called bedrock is another layer of gravel, through which to bedrock of the creek is estimated to be 10 to 20 feet. In a few instances miners have been able, in the winter time, to penetrate through the upper gravel and the glacial clay to the lower strata of gravel, but have been able to penetrate it only a foot or so. This lower gravel has been found to be a compact gravel, darker in color than the upper, with much iron rust indications, and very rich.

The steamer Humboldt, arrived from Skaguay and Alaska, brings \$500,000 Alaska gold dust. The steamer St. Paul, nine days from Nome Aug. 6th, brings \$410,000 gold.

ARIZONA.

COCHISE COUNTY.

Work has begun on the Tombstone branch of the El Paso & Southwestern Railroad.

The Hidden Treasure, a south extension of the Monte Cristo, has been bonded by the Monte Cristo Co. for \$40,000.

The Los Angeles creditors of the Copper Belle M. Co., which is working some properties at Gleason, have petitioned the United States Court at Tucson asking that the company be declared bankrupt. The Copper Belle M. Co. is a West Virginia corporation which purchased some copper prospects from the founder at Gleason, and has been working them extensively. There are already three attachments on their properties, one of them being for \$6000 attorneys' fees claimed by Judge Reilly of Tombstone. The secured and unsecured debts of the company will aggregate \$100,000. W. J. Kirkpatrick of Tucson is representing the Los Angeles creditors.

Near Bisbee, the machinery for the new hoisting plant of the Modern Copper Co. is being put in position.

GILA COUNTY.

The Era hears that the Gila Valley, Globe & Northern Railway will make a reduction of one-third in its freight rate shortly, so as to satisfy the mining companies around Globe. The Old Dominion Co. has paid in excess of \$300,000 per annum in freight rates, which fact has had much to do with the high cost of the Old Dominion copper. The reduction of rates will permit the Old Dominion to work lower grade ores.

N. S. Berry, superintendent United Globe mines, Globe district, says the company employs forty men, and steady work is being prosecuted. The company has shipped considerable ore to Bisbee for reduction. The property is owned by the Phelps Dodge Co.

C. M. Clark, interested in an electrical enterprise near Globe, says the site of the water power plant by which electricity is to be developed is on Salt river, directly north of the town of Globe, 2 miles above the Tonto reservoir. Water will be diverted from the site by a 1½-mile tunnel, and conducted by alternate tunnels and flumes for 6 miles down the river, gaining a head of 289 feet. Power in Globe and the camps roundabout costs now \$300 a year. Electric power will be furnished at \$150 a year. It will take eighteen months to complete the plant after the work has actually begun. It will take almost a year to get the machinery on the ground after it has been ordered.

GRAHAM COUNTY.

The Antetam mine, near Metcalf, is being developed by P. F. Crowley. Ore is being sacked at the mine to be shipped to the A. C. Co. of Clifton for treatment. The Troy smelter at Troy has been temporarily shut down on account of a strike of the hoisting men. The men were getting \$4.50 per day and demanded \$4.50 for eight hours' work. The com-

pany refused, closed the smelter and stopped work on the Alice mine. The company has a carload of copper 97 fine ready for shipment.

So much water was struck in sinking the main shaft on the Stevens group of claims, near Metcalf, that a pumping plant must be put in.

MOHAVE COUNTY.

At Chloride, the new smelter starts August 15th.

The concentrating plant at the Tennessee mine is running on full time.

The Philadelphia & Arizona M. Co., which owns the Connor-Minnosota, Merimac and undeveloped claims, begins opening up next month.

The strike in the Minnesota-Connor mine, near Kingman, is still showing up. A hundred tons of the ore will be tried out at the smelter to ascertain the feasibility of smelting in connection with the concentration plant. If the concentrates have to be handled they will be briquetted.

PIMA COUNTY.

The sale of the Indiana Sonora group of mines has been declared off, says the Tucson Citizen. Had the deal gone through it would have been the largest consummated either in Mexico or Arizona this year. It was reported that the Phelps-Dodge people had purchased the property. The price paid was said to be something over \$1,000,000. The deal was fixed up in New York, and a number of Indianapolis people were named as the owners. It now appears that the Indianapolis people merely had a bond on the property. L. Lindsay is the real owner of the mines. About six months ago he bonded the group to the Indianapolis parties, and now it seems that this bond expired about five days after the so-called sale to the Phelps Dodge Co. The provisions of the bond were not lived up to by the holders of it, and consequently the mine reverted to the original owner. The provisions of the sale call for monthly payments, but they do not cover those of the bond.

SANTA CRUZ COUNTY.

The Buena Vista M. Co., whose copper mines are in the Patagonia mountains, 12 miles from Nogales, will erect a smelter, concentrating and converting plant on the Santa Cruz river near the Southern Pacific railroad. Either a railroad or aerial tramway will be built from the mine to the plant, distance 4 miles, under the management of F. N. Cox.

Last week, says the Oasis, the first carload of gold ore ever shipped from Nogales went forward to El Paso from the Uncle Sam mine, 5 miles from Nogales.

YAVAPAI COUNTY.

Jerome reports the fire on the first, second and third levels of the United Verde mine partially under control, though the mine will have to be closed down and bulkheads put in. So far there has been but one death from the fire, a miner who had gone down to rescue others who were caged by the flames. After saving the lives of the men the rescuer was overcome and died. The loss to the workmen by the shutdown will be heavy.

The Senate Gold Co., whose property adjoins the Congress mine, has ordered a 54 H. P. Fairbanks & Morse gasoline engine and will install an air compressor and three Sullivan drills. A pump with capacity of 125,000 gallons a day will also be put in. The property was bought by the Senate Gold Co. from Carrigan & Morgan, employees of the Congress Mines Co., last March.

The Verde Queen Copper Co., at Jerome propose to sink 5000 feet and at that depth drift 1000 feet.

Near Prescott, Superintendent Jones of the Braganza G. M. Co. has fifty-five men at work on the Henrietta.

It is reported that the Gold Basis group, on Groom creek, near the Monte Cristo, 7 miles from Prescott, is sold for \$65,000, and that the purchasers will sink 500 feet.

The United Verde copper mine produced 41,970,210 pounds of copper in 1901. Manager Felt of the Model G. M. Co. is putting in a 10-stamp mill, steam boiler, etc., near Kirkland.

Manager Baumann of the Baumann C. Co. will concentrate present development work upon the Swiss Girl mine.

The Oriental M. Co., in Big Bug, is putting in a forty-ton mill on the Tough Nut claim.

The Victor M. Co., Lynx creek, is operating its new mill.

The Empire on Groom creek has resumed work.

The Chicago Co., whose mill is in the hands of the Hassayampa, will put in a fifty-ton electrolytic cyanide process plant in connection with the mill.

CALIFORNIA.

AMADOR COUNTY.

The Jackson Ledger reports that at the Amador Phoenix an extension of the bond on the property for six months has been

secured.—The Sargent shaft is following the ledge, and in soft slate and gouge.

—At the Argonaut no effort is being made to keep the mine free of water. When the shaft work is finished it is expected that all work will cease pending the decision by the United States Supreme Court of the Argonaut-Kennedy suit.—The Onelda's cleanup left a balance of nearly \$5000 after deducting running expenses. Forty stamps are running.

At the Gwin mine the new hoist will be run by water, as is the present one. The shaft is 1840 feet in depth. Sinking will probably be resumed. The 80-stamp mill is running.

At the Lincoln mine Supt. Voorheis is pushing the west crosscut on the 2000 level.

On the Mocking Bird ranch a quartz claim is reported sold by O. Jones to Seattle, Wash., men for \$5000—\$300 down, remainder in installments.

J. A. McIntire has bonded the old North Star claim, between Sutter Creek and Amador City, for \$15,000.

A telephone system has been established throughout the Gwin mine.

The Jackson Herald says the Rhetta M. Co. has now paid about \$7800 on the purchase price of \$20,000 for the Bay State mine. W. W. Worthing expects to start the mine Sept. 1.

CALAVERAS COUNTY.

Near Angels the Crystal mine is to be reopened and shaft retimbered. An engine, boiler and hoist capable of sinking 1000 feet will be put on. W. Morehead, formerly of the App, is in charge.

The rich rock found in the Oriole continues to grow in value.

In cutting a station at the 1300 level in the Ghost mine a rich vein has been struck.

The Sultana shaft is down 600 feet, at which point rock has been found running \$10 free gold.

The Altaville mine is shut down, preparatory to putting in an air compressor and a larger hoist.

Sinking progresses at the Last Chance mine.

EL DORADO COUNTY.

In the Eureka slate quarry, near Kelsey, 3 miles north of Placerville, the slate is in a vein about 100 feet wide, standing almost vertically on edge. From a pit 41 feet deep at the base of the cliff slate is taken up to the splitting sheds. The slate is quarried in benches of 8 feet; the rough blocks are sent to the blockmaker, who grades and reduces them to sizes. The splitter reduces them by means of long, thin chisels to sheets about an eighth of an inch thick; they are then trimmed to a rectangular form, the object being to get the biggest slate possible out of each irregular piece. Great waste is caused by blasting, which is necessary until the quarry can be enlarged sufficiently to enable a channelling machine to be used, which will cut out blocks without shattering them. To provide for this enlargement, two tunnels are now being driven on the north end of the quarry. The quarry produces 500 squares per month, divided into sixteen different sizes, ranging from 12x24s to 6x12s. The slate is rated at about \$7 per square at Placerville and sells readily. A trench has just been dug to contain 6800 feet of pipe, from 18 inches down to 11 inches in diameter, for water from the Delmatia reservoir, where a new air compressor is to be built. The pressure will be 550 feet; 100 H. P. will be developed.

C. Edner says the Omo mill is crushing ore. Supt. Smart is operating his hydraulic mine. At Becher's Crossing twelve men are employed.

FRESNO COUNTY.

(Special Correspondence).—G. E. Shores of the Esperanza Oil & Gas Co. says they have struck a 200-barrel well of 20 gravity oil at 975 feet on section 6, township 19, range 14, near here. There is 900 feet of oil in the pipe and the well, which is in the third sand, has a periodical flow. A 2000-barrel tank is to be put up and another well sunk, probably 300 feet to the south.

Coalinga, Aug. 4.

KERN COUNTY.

The Randsburg Miner reports the July clean-up of the Butte \$5725, product of ninety-one tons of ore, \$63 per ton.

Bakersfield reports that the California Power Co. has sold its \$3,000,000 of bonds in Chicago. Work can soon begin on the proposed plant in Kern river canyon.

The Santa Fe Railroad Co. has bought the oil wells and land of A. B. Butler and others at a sum reported all the way from \$1,000,000 to \$2,300,000. Butler had a five-year contract with the Santa Fe Railway to furnish that corporation with a large quantity of oil annually at 75 cents per barrel. At the time this contract was made oil was worth considerably more. Since then oil has declined; at one time the price at the wells was 15 cents per barrel. The Santa Fe Co. found it ex-

pedient to buy the property of Butler and associates.

KINGS COUNTY.

(Special Correspondence).—Francis & Dawson, prospecting on the Avenal ranch, 45 miles southwest of here, have found cinnabar rock that goes 6%, and have shipped several flasks to Los Angeles. They will put in machinery, including a 12-foot retort.

Lemoore, Aug. 5.

LOS ANGELES COUNTY.

The Mining Review says that the West Coast Fuel & Iron Co., owning 740 acres in Los Angeles and Kern counties, has taken out iron ore and has produced the first commercial pig iron ever produced in southern California, being the first to secure results from smelting with crude oil. The demand for commercial pig iron in Los Angeles is upwards of 600 tons per month. The price quoted last week was \$29 50 in the local market, while Pittsburgh prices range from \$21 to \$22 per ton. The cost of the crude oil used is calculated on the basis of \$4 coke; at this cost there is a profit in the freight rates alone.

MARIPOSA COUNTY.

From sixty tons of rock from the Jacob Teats mine, at Whitlock, recently milled at the Ellingham mill, 114 ounces of gold was secured.

In a recent fire that swept the North Fork country the 5-stamp mill and office of the Banderita mine were entirely destroyed.

N. C. Ray of Coulterville has started the survey for the proposed electric plant to be established on the Merced river to supply power for the mines of northern Mariposa.

The Chronicle says that the Penon Blanco mines, 2 miles from Coulterville, have been bonded to a French company. They belong to Captain A. H. Ward.

MONO COUNTY.

The Crystal Lake M. Co., at Lundy, is working about 100 men, running fifteen stamps in the mill and putting in a new mortar, preparatory to adding five stamps more. The lower tunnel is in about 1850 feet and progressing at the rate of about 43 feet per week.

NEVADA COUNTY.

The Union reports a clean-up from the fourteen days' run at the Sierra Queen mine, near Nevada City. It is understood that within a short time the present working force will be increased.

About the 20th inst. the Pennsylvania mine will resume. The underground workings have been idle since July, 1901. The works are free of water and the men can begin where operations were suspended. Surveyors have begun to get data for a report on the underground workings before the commission to decide upon the question of damages between the Pennsylvania and the W. Y. O. D. The former sued to recover \$600,000.

This week the W. Y. O. D. suspended operations, laying off fifty-three men, who have been employed since the litigation with the Pennsylvania began. The tributers have been told to hurry their work along as speedily as possible and clean up all their rock, as no more work would be done there until some future date.

Near Grass Valley J. E. Carter expects to be soon able to resume at the South Idaho.

Near Nevada City Supt. Turner has unwatered the Coe mine and is sinking and drifting on the 800-foot level.

The machinery on the Hartery mine, at Allison Ranch, is to be removed to the Nugget mine, owned by H. B. Nichols.

The acquisition of the Red Cross property, near Omega, by a new company, was noted in the issue of July 26. The Red Cross M. Co. this week filed articles of incorporation, to "engage in the purchase of mining and mineral lands and the treatment of all mineral-bearing ores and to develop and work mining properties." Incorporators: J. A. Brent, San Francisco; W. F. Snyder, C. I. Rader, C. O. Ellingwood, B. Snyder, Salt Lake City, Utah; P. L. Kimberly, Sharon, Pa.

Near Spenceville, Superintendent Bitner of the California G. & C. M. Co. is doing considerable exploration work on its ground. An assay gives gold \$7, copper \$20 per ton. The company proposes erecting a smelter.

A new pipe at the New Independence mine gives ample power to run the mill at its full capacity and additional power for hoisting.

The North Bloomfield Co. will make extensive repairs to its ditches and flumes, and has ordered 3,000,000 feet lumber.

PLACER COUNTY.

At the Crosby M. & M. Co.'s property, near Lincoln, Supt. J. B. De Golyer will have mine machinery on the ground by Sept. 1, when work will begin.

J. B. Patterson is locally credited with intention to resume work in the Patterson mine, 2 miles north of Penryn—160 acres.

The mine has been opened by a 1000-foot tunnel and is in and under gravel.

FLUMAS COUNTY.

H. L. Coffin, secretary Canton P. M. Co., north fork of Feather river, is having work done on the property.

Nelson Point reports discovery of stones on Nelson creek which are locally pronounced to be genuine diamonds.

A. B. White, Supt. Quincy M. & W. Co., is engaged in the season's cleanup.

RIVERSIDE COUNTY.

C. H. Gray, from Arica Mountain district, has \$2000 bullion, taken from sixty tons of ore from the Arica group of mines, 60 miles south of Danby.

SACRAMENTO COUNTY.

The Sand Pile mill, near Folsom, is putting in two cyanide tanks.

SAN BERNARDINO COUNTY.

The mines of Vanderbilt district, which have lain idle for several years, are again to be worked. With the extension of the California Eastern Railroad the camp is now reported enjoying a revival of old times.

The St. George and Boomerang mines at Vanderbilt, belonging to the A. G. Campbell estate, have been sold to Eastern men. The pumps are raising the water from the lower levels and preparations are being made to work the properties. Green Campbell is in charge.

The Gold Bronze mine will shortly resume work, after many years of idleness.

SHASTA COUNTY.

The McCloud River Electrical Power Co. has given a contract to the San Francisco Construction Co. and G. W. Elder to construct a concrete and masonry dam on the McCloud river, 20 miles from Baird Station, the dam to be 100 feet high, 500 feet long, constructed of concrete, masonry and rock filling.

The Redding Free Press says the Tarbet Mining Syndicate of Salt Lake City, which bonded the Afterthought copper and gold mine, near Furnaceville, now owns the mine, having paid about \$100,000. The Tarbets are locally believed to only await the building of a railroad to put up a smelter and add a copper and gold producer to the list.

The Heintz G. D. Co. launched the boat for the dredger near Horsetown this week. The barge is 100 feet long, 36 feet wide. The dredger will run day and night, with a capacity of 4000 cubic yards per twenty-four hours. Diggers fastened to moving chains break up the gravel, which is then lifted by centrifugal pumps. The power will be supplied by the Northern California Power Co.

Work will soon begin on the new power plant that is to be put up near Whitmore by the Northern California Power Co.

Panter & Litsch, who have been tunneling at a cost of several thousand dollars in the Evening Star mine, at Old Diggings, have a ledge 3 feet wide.

The Searchlight says that more than 350 men are now at work in and about the Iron Mountain mine, Keswick, and every man who applies is given employment. The mine payroll has contained in the neighborhood of 600 names on more than one occasion in the past, but a large number of these were hammer men. Machine drills have taken their places. The present force, with the aid of machines, is as efficient in productive capacity as the larger force of three years ago. The workings are cool and the extraction of ore is proceeding on nearly all of the levels. Men are doing development work on the Hidden Treasure mine, also owned by the Mountain Copper Co.

At the Hornet and other claims on the north side of the mountain, diamond drills are in use. Ore is coming down from the mine faster than the smelter consumes it, and reserve supplies are in storage at Keswick. There are still large supplies of calcined ore on hand in Keswick—8000 tons at the Sacramento and 13,000 tons at the Race Track.

At Keswick and Iron Mountain ore trains are running, ore bodies struck, smelters starting up again and several new smelters to be installed. Tunnel drafts have been walled up by masonry and dumpage dumped in the chute over the fire. Water has been allowed to soak in above the burning portion where the smoke used to issue, and no smoke is coming out now. After the winter torrents had flooded the mine, the fire broke out again, but this method of smothering the fire with smoke will be successful.

G. A. Von Krusze will put extensive improvements on his Sybil mine near French Gulch—a steam hoist, air compressor and air drills. A consignment of 625 sacks—two carloads ore—lies in Redding awaiting shipment to the smelter.

SIERRA COUNTY.

Supt. Buckley expects to reopen the Empire mine at Gold Valley and sink the shaft, already down 400 feet, to the 1000-foot level.

SISKIYOU COUNTY.

M. M. Hough has sold to R. Phillips, Scott River, for \$100,000, in installments, the Quartz Hill, Ryan and California mines, ditches, giants, pipes and other apparatus. This property will be worked on an extensive scale as soon as arrangements are completed.

The dredger at Hawkinsville has been fitted up with electric lights so as to put on night shifts.

The Blue Gravel mine, near Yreka, is to be reopened by a local corporation.

TRINITY COUNTY.

The California Mother Lode Mines Co. have three claims near the Midas mine. The ore is free milling. The lead has been crosscut in two places, showing a vein about 30 feet wide, an average value of about \$7 per ton.

In the Schroeder quartz mine at Deadwood active operations are to be carried on steadily.

TUOLUMNE COUNTY.

The Hidden Treasure Blue Gravel claim on Table mountain at Mormon creek is being worked by C. L. Lang and Duchow Bros. Upraises have been run and the eastern rim of the old river bed channel encountered. The slate bedrock is hard as adamant. Drifting is in progress along the bedrock to crosscut the channel. Another upraise is being run to tap the channel at its lowest point.

At the Shawmut 100 stamps are in operation; the cyanide and chlorination plants are working to full capacity.

Forty additional stamps go in the Shawmut mill.

The Sonora Democrat reports that the shaft in the Soulsby mine is nearing the 300-foot mark.—A contract has been let to sink a shaft on the Sullivan mine. Hoisting works are being erected and an air compressor will be put in.—The O'Hara mine, north of Sonora, has yielded \$3000 gold during the past week.—At the Republican mine a contract to sink the main shaft to the 600-foot level has been let.

COLORADO.

The Colorado World's Fair Commission has a space 300x700 feet close to the Mines and Metallurgy building on the St. Louis World's Fair grounds, which was illustrated and described in the issue of June 7, 1902, which will be used solely for the outdoor exhibition of operative mining machinery. This is designed to afford the manufacturers and inventors of quartz mills, concentrators, electric, compressed air and machine drills, stamp mills and all processes of reduction of ores in Colorado an opportunity to make exhibit. To further the success of this project, G. W. Thatcher, commander-in-chief of the St. Louis World's Fair Board for the State of Colorado, wishes to communicate with all the manufacturers of mining machinery in the State.

BOULDER COUNTY.

(Special Correspondence).—Cotton, Harris & Brown are taking out ore on the Forest mine which nets them \$7 per ton, and are doing a great deal of work on the property.

Wall Street, Aug. 1.

CHAFFEE COUNTY.

The Twin City M. Co. has bought the Vivandiere mine, near Turret, and working more men than ever before, have opened a 12-foot vein in the south crosscut, stopping ore that will run \$60 per ton.

Near the Darling claim Chinn & Roller, Salida, have been working three adjoining claims 3 miles from Garfield, at an altitude of 13,000 feet, a body of lead, silver and gold being uncovered. The vein is 12 feet wide, between a hanging wall of porphyry and foot wall of granite. There are 18 inches of carbonate ore next to the porphyry, 8 feet of quartz and 2½ feet of lead ore, the latter 40%.

CLEAR CREEK COUNTY.

Silver Plume reports a strike in the Seven-Thirty mine 3000 feet from the entrance to the tunnel and 1700 feet under the main workings. Four inches of ore has been opened up, which runs high in gold and carries 500 ounces in silver. Supt. Robison says that mine is one of the few silver propositions which withstood the panic of 1893 and its production has been maintained continuously.

Georgetown reports rich ore in the Cope & Barker lease on the Sunburst—gray copper, black sulphurets and polybasite.—The Alitude is producing high-grade ore.—Manager Wilcox will put in a gasoline engine and blower on the Tobin level of the Independence.—Work has been resumed on the Kirtley mine, Leavenworth mountain.

Near Idaho Springs, the Brighton mine, west of the Freeland Extension, which has been idle three years, is to be started up, a new shafthouse, 58x30 feet, built, and a steam hoisting plant put on. D. Ellis will be in charge.

The New Era Co., under the manage-

ment of J. R. Elgan, has started sinking the Great Eastern shaft, now 160 feet deep. The company owns its own mill—the only one left at Freeland. A Leyner compressor with a 4-drill capacity and water Leyner drills will be used in sinking and drifting.

The New Era tunnel is to be driven ahead to reach a number of leads, some of which show large, strong veins on the surface. It is understood that the company now has ample money in the treasury to do all dead work contemplated and then be in position to take out ore enough to keep their mill steadily employed—two shifts on their own ores. J. F. O'Neal is the foreman, and all the men that can be used advantageously will be put to work as soon as some little timbering is done.

The Woodbury M. & M. Co. owns sixteen lodes on Breckenridge mountain and has ore opened up for 240 feet in its tunnel. The ore streak gives a value of \$19.75. The company is having plans prepared for a mill, capacity fifty tons daily, to be run wholly on its own ores. R. S. Grier of Empire is superintendent.

GILPIN COUNTY.

(Special Correspondence).—The Mann vein, near here, which was discovered in 1860 by Dr. Mann, is one of the oldest patents in Gilpin county and is now being worked by the Ann Rutledge G. M. Co., A. B. Sanford, manager. In the early days the property was worked in a small way, but over \$100,000 was taken out in gold ore. The property passed into the hands of D. F. Pease, who erected a large shaft house and was getting ready to do business, but destroyed the shaft house and also the timbers in the shaft, causing the shaft to cave in. Work was abandoned for about thirty years. The property came into the possession of the Ann Rutledge G. M. Co. about two years ago, and they have been doing a great deal of work ever since. They now have a large shaft house, gasoline hoist capable of hoisting 600 feet. Nothing but development work has been done the past two years; they are just beginning to take out some good ore which they are shipping to the smelters and some to the mills. They intend erecting a large boarding house.

Central City, Aug. 3.

During the fourth week in July the shipments of smelting and crude ores, tailings and concentrates from the local depot to the Golden and Denver smelters, and to Idaho Springs, were ninety-six cars, 1920 tons. The total for July comprised 409 cars, 8180 tons, which as compared to the same month in 1901, shows a gain of ninety-one cars, 2450 tons, over 40%.

The Boston & Denver Con. M. & M. Co., Black Hawk, has sixty stamps crushing from 125 to 150 tons every twenty-four hours. The ores are hoisted from the Gregory incline. O. B. Thompson is manager.

H. Bolthoff of Denver is going to start another tunnel from the North Clear creek to cut the H. B. lode, opened up on the side of Nagle hill. By driving this tunnel 200 feet it will cut the lode at a depth of 275 feet.

GRAND COUNTY.

At a depth of 375 feet a flow of artesian water of 8000 barrels per hour has been struck, 8 miles north of Kremmling. It is the only artesian well in the State with such a flow. The well was being sunk for oil. Besides the flow of water, gas is also rising in great quantities.

GUNNISON COUNTY.

In Taylor Park the Taylor Park M. Co. report a vein 35 feet across uncovered averaging \$8 in gold. The ore is free milling and is found in porphyry between granite and quartz.

At Pitkin E. P. Ellsworth has bought the Golden Islet group of R. Heffner. The latter will still be a stockholder in the company. The agreement calls for \$40,000, part going to the original owner, the remainder to be expended in extensive development work.

HINSDALE COUNTY.

(Special Correspondence).—D. A. Farrell, manager the Red Rover M. Co., is pushing the work to completion on his new power plant and mill. Mr. Farrell gave me the following information regarding his property: For his power plant he has a building 26x46 feet, 14 feet high; a 24-inch pipe line, made of Oregon fir and iron bonds, 3750 feet in length; 5-foot De Remer water wheel; 180 K. W. generator; 1½ miles of electric line to the mill and mine. He has 400 feet head of water and can generate 800 H. P.

The bunkhouse is 90x20 feet and will accommodate about 100 men; has fine bath, wash and reading rooms for the use of the men.

The mill is 82x76 feet. The highest portion will be four stories. A machine shop will be operated in connection with the mill. The mill will contain one set of crushers, two sets of rolls, one single and two double Hartz jigs, three Wilfley

tables, 40x40-foot canvas tables for slimes, one 80 H. P. boiler, one 125 H. P. engine, three dyamos, 150 sixteen candle power lights. The mill will have a storage capacity for crude ores of 100 tons and the same capacity for concentrates. The daily crushing capacity of the mill will be 100 tons, table capacity 50 tons. The ore will be transported from the mine to the mill by a gravity tramway 654 feet in length. The concentrates will be loaded into wagons without handling by this system. Nearly everything about the mill will be done by gravity.

There is about 1½ mile of underground workings in the mine. The crosscut tunnel is 1175 feet in length, drift on the vein 575 feet, upraise connecting with the surface 600 feet. There are seven levels run from the upraise. Doing development work at present employs about thirty-five men on the mill and in the mine. About \$60,000 worth of ore has been stoped out in the upper level. There is ore now in every level of the mine, which averages about \$65 per ton. There is also ore that runs \$700 per ton, which is shipped crude. The lower grade ore is concentrated. The ore is gray copper, gold, silver and lead, the pay streak being 7 feet wide. The main tunnel is over 1000 feet in length, without a curve, the track in the same being perfectly straight. The mine will be lighted by electricity.

Lake City, Aug. 1.

LAKE COUNTY.

The assayers and mining men of Leadville are naturally wroth over the promulgation of a new rule by the American S. & R. Co., in effect that as between the company and the assayers all umpire work must hereafter go to Denver, and "splits" are done away with. The Herald-Democrat, in explaining the reasons for its adoption, says that one of the major difficulties connected with the business of mining is the determination of the exact metal contents of the ore shipped to the smelters. It is almost impossible to obtain two assays even from the same pulp which will exactly check, and controversies frequently arise which, according to long established custom, have been settled by compromise or umpiring. To illustrate: After the miner and the smelter have made their assays of samples, obtained from the regular system of sampling, a comparison is made and in ninety-nine cases out of a hundred there will be a slight difference. In many cases, the mine assays are slightly above those of the smelter. This fact, as explained by assayers, is not due to any intentional effort to actually change the result as shown by the scales, but to a system of reading the scales in many cases whereby minute fractional parts are either done away with or counted. Yet both are right, according to the system used. The mine assayer takes the higher readings, the smelter assayer the lower. And, in addition, there is always the natural element of disagreement which is bound to creep in where the delicacy of the operation is taken into consideration. Formerly "repeats" were allowed. By this method the miner and smelter sometimes came closer together. If not, then the pulp went to an umpire; in other words, to a reputable assayer, satisfactory to both parties. The trust abandoned the "repeats" some time ago. Under the new rule, "splits" also go to the wall. The miner settles for his ore on the basis of the smelter assay, or he can have recourse to an umpire, but the umpire in all cases must be a Denver assayer and the work must be done here. Leadville assayers are barred on the ground that they are too high. On the other hand, it is asserted that the Denver assayers are too low. The mine operators interviewed say: "It simply means that we must settle on the smelter assay. We have no other recourse. So far as the mine is concerned, there is really no reason under the new rules to assay the control at all. The assays on bucket samples would probably give us what information we desired as to how the ore was running, but the smelter assay must be accepted as the basis of settlement. While arbitration or umpiring remains, the smelter virtually names the umpires."

The whole thing shows what a "benevolent monopoly" will do when it has a chance. The thing is flagrantly one-sided. It will be interesting to see what Eastern mining publications "retained for the defense" will have to say, unless it be a case of addition, division and silence.

The Leadville output for July was 80,000 tons, of which 10,000 was zinc ore. It is estimated that the average gross value of the ore is \$14 per ton.

MINERAL COUNTY.

Creede reports are to the effect that the Amethyst mine will probably close down on the last of the month, because the ore is too good a milling proposition to ship crude at present railroad rates and smelter charges, when it can be concentrated from five or six tons into one,

and that a concentrating plant is to be put in.

OURAY COUNTY.

(Special Correspondence).—The Camp Bird veins are a milling proposition. The veins vary in width from 3 to 20 feet, a probable average of 7 or 8 feet. The gangue is principally quartz, in some places being very soft, but filled with gouge clay and talc, in some of the larger streaks considerable roselinite.

The Camp Bird mine is worked through three tunnels, the lower one being at an altitude of 11,300 feet. The lower tunnel is to crosscut through over 2000 feet in length andesitic breccia before striking the vein. Following the general plan in mining to stop overhand to work on broken ore in stopes, the present policy is to leave in the stopes fully as much ore as they send to the mill, so that the reserves are being added to in a ratio proportionate to the amount of ore milled (about 200 tons per day). The ore is sent down to the mill by a Bleichert aerial tramway, having a length of about 10,000 feet. The standing rope is made of interlocked wires and the transmission rope is a Trenton Iron Works 3-inch cable.

In the mill the ore undergoes the following treatment: First it is screened by grizzlies spaced 2 inches center to center. The coarse passes through crushers, 9x15 jaw opening. From the ore bins automatic feeders pass the ore to the stamps, of which there are sixty, each one weighing 550 pounds. The stamps run at 100 drops per minute, 6-inch drop, 4 inch discharge. The screens used are 26-mesh No. 29 wire, as these are found to give a more rapid discharge than the slot screens. After being crushed by the stamps the pulp passes over copper plates 16 feet long, then over a shaking quick trap, and then the plate tailings are passed to concentrators, being first classified in V boxes. This hydraulic classification of the plate tailings renders concentration on vanners or tables more satisfactory. They have thirty-five concentrating tables at present and talk of increasing the number. The tailings are passed into a hydraulic classifier, the coarse part sent to a Huntington mill, re-ground and reamalgamated and the tailings concentrated. The tailings from the stamp mill are run to the cyanide plant, where they undergo the usual percolation treatment. The cyanide plant is arranged for both single and double treatment, a single treatment occupying about thirteen days and the double treatment about nine days' time. The cyanide solution has a strength of four pounds to the ton of water. The slimes which escape settling in cyanide vats are run into a tank and there settled. These slimes are subsequently treated by the cyanide process in agitation vats. At present they are improving upon the slime treatment by the use of filter presses, and have retained E. B. Hack for these experiments. The mill is at an altitude of 9900 feet. When Mr. Hammond was here he had not decided on a permanent manager and appointed Harold A. Titcomb to act until a permanent man could be appointed.

Ouray, Aug. 1.

L. B. Jackson, president Imogene Gold Basin M. & M. Co., has returned from the East and will work on the group, which adjoins the Camp Bird veins, near Ouray.

D. Wood, manager of the Ouray Chief mine, has inaugurated a plan to allow the employees of the mine a bonus of 10% of all dividends declared in addition to their regular wages.

PARK COUNTY.

(Special Correspondence).—The placer season here has been cut short on account of scarcity of water. There has been considerable advance in placer mining at this point this summer in increase of operations, and a larger number of men employed and more gold taken out for the length of time.

The Snow Storm Hydraulic Co. at Alma have made extensive improvements. They have an excellent plant for the operation of their properties with electric lights for their grounds and pits. They put in their plant and had same in operation in three months. They intend spending \$85,000 in the development of their properties.

The London mine, probably the best producing mine at Alma, has started a new tunnel of 800 feet. The work is being done with power machinery and drills. This mine has produced ore running as high as \$500 per ton the past year, we are informed.

The Bucksin properties—Cleaner, Criterion and Ohio Bonanza groups—have gone or about to go into a syndicate which has already put men at work cleaning up around the Winrow mill, which they propose changing into a cyanide plant.

The Kentucky Belle, also in Bucksin gulch, is operating the Sherman, a small stamp mill, producing a carload of concentrates per week.

J. Moynahan of Alma is leasing on the

Champaign-Fannie in Mosquito gulch doing tunnel work. He is driving the fourth tunnel, which is now in 350 feet, to cut a shoot that produced considerable good ore in the third level, running over \$500 per ton. He expects to strike same in the next 25 feet. Mr. Moynahan is also working the Faulkland on Bross mountain and intends cutting the Mooso dike, which has produced something like \$3,500,000. This property has not been worked since 1893 until the present time.

The Oliver Twist mine has let a contract for 150 feet crosscut in its tunnel. Alma, August 1.

Breckenridge citizens have 6000 acres of oil lands and have organized the International Oil Co., incorporators G. H. Evans, G. C. Forsythe, W. H. Snelson, J. H. Marks, R. L. Gore.

Near Alma, W. H. Smith & Co. of Denver, who have the Mount Bross Con. G. M. Co. mill, will have a cyanide equipment placed in the mill to save 90% values in the ore.

SUMMIT COUNTY.

Superintendent T. Harris of the Oro Grande Placer M. Co. at Dillon has the pit down over 70 feet. They have two Evans hydraulic elevators at work, with two flumes.

At Breckenridge, G. H. Evans, manager Gold Pan Co., plans next season to open up with five flumes, into which will pour continually as many streams of gold-bearing gravel and sand, fed by four hydraulic elevators and one mechanical elevator, the capacity of the plant to be 8000 cubic yards daily.

TELLER COUNTY.

The tonnage as given out by the various mills and smelters treating Cripple Creek ore is as follows for July:

	Tonnage.	Average value.	Total value.
Smelters.....	13,500	\$60.00	\$810,000
U. S. R. & R. Co.	20,000	30.00	600,000
Union.....	12,000	28.00	336,000
Portland.....	5,000	30.00	165,000
Economic.....	4,700	31.50	148,050
Dorcas.....	2,800	27.50	77,000
Telluride.....	2,750	25.00	68,750
Aequa.....	900	11.69	10,521
Brodie.....	250	8.00	2,000
Totals.....	62,500		\$2,217,321

Manager C. C. Hamlin, Granite G. M. Co., states that the company is starting work in the south drift of the eighth level to open the ore chute recently exposed in running the ninth level south. The ore is running from \$33 to \$67 a ton.

G. P. Goodier, manager Oro Verde M. & M. Co., on the Clear Creek slope of Yankee hill, is developing through a crosscut tunnel a group of mines.

J. F. Burns, president Portland G. M. Co., says that during the month of May, 1901, the Portland pumped 19,000,000 gallons of water in one month and never said a word about it in the papers. That was at the rate of about 4500 to 4600 gallons a minute, which is double what the Elkton or any other mine of Cripple Creek district has ever handled. The water flow was exceedingly heavy, but they were able to handle it. They say they had to handle it and went after it and said nothing about it. They drained the property and then ran out the levels. When they came to sink the shaft again they found some water, but it was not so great as during that month. "There is too much talk," he thinks, "about water in the Cripple Creek district."

Superintendent W. Bainbridge of the El Paso mine, in speaking of the necessity for the tunnel, cites the case of the Ontario tunnel, at Park City, Utah. That tunnel was driven a distance of 4 1/2 miles to cut the Ontario mine at the depth of 1400 feet. The work was performed by the Ontario Co. single-handed. The mine has produced something like \$34,000,000 and paid in dividends about \$14,000,000. Cripple Creek has produced \$100,000,000 and paid in dividends \$30,000,000. In the Record he says he thinks the best place to start the drainage tunnel is down Cripple Creek a half mile up from where it empties into Four Mile. A tunnel from that point would have to be driven 1 1/2 mile, where the granite rim would be cut. There the water could be tapped, which would give immediate relief to a good portion of the district; survey shows that it would cut the Elkton shaft at a depth of 2135 feet below the collar of the shaft, while Bull hill would be cut at about 3000 feet. This tunnel, to drive as far as the Elkton mine, would cost about \$1,250,000. There is another tunnel site that would be about three-quarters of a mile shorter that would cut the Elkton at 1400 feet. That could be driven for about \$800,000. With the water that is being thrown now that goes down by the site of the tunnel, sufficient power could be obtained to operate all the machinery necessary to do the work. Mr. Bainbridge says: "If a drainage tunnel is not driven the outcome of the entire situation will be that a few companies will own the district and will do it themselves. It only stands to reason that such is the case, and for the very reason that eventually if the companies keep on pumping they will reach the point where they are at a greater expense in pumping than the profit derived from the ore. When that point is reached they will be forced to suspend. The capitalist will take in everything he can, and he will obtain them cheaply; then he will drive the tunnel and derive the benefit. The reason that a tunnel driven from the Cripple Creek point would be better than one from any point east is the fact that it will cut through the entire system of dykes. By running farther east it would run with the dykes, which would be better left undone."

Suit has been filed in the Federal Court by the Portland G. M. Co. against the Monument G. M. Co. for damages. The claims of the two companies are located side by side in the Cripple Creek district. The complaint alleges that a vein which apexes in the Tidal Wave claim of the Portland Co. is being worked by the Monument Co. and that ore to the value of \$250,000 has already been taken out. Such vexatious and costly litigation will continue till the repeal of the apex law.

The half yearly statement of the Anaconda M. Co. shows results of the company going on the leasing system and suspending operations on company account. For the first six months of the year there was shipped from the property 3614 tons of ore, valued at \$92,358.35. Of that amount lessees shipped 3198 tons of ore, the gross value of which was \$83,625.12. From that amount the company received in royalties \$13,827.19.

Manager A. Wagner of the Pharmacist Con. M. Co. reports the main shaft has been sunk by the Mitchell Leasing Co. 90 feet, total depth 660 feet. The same lessees have drifted and crosscut 250 feet on the seventh or lower level. Arrangements are now made to sink the main shaft an additional 200 feet, from which depth—860 feet—crosscuts will be run to the vein. All of the debts, including the Zenobia judgment of \$2 100 and interest, have been paid. "We have a cash balance in the treasury of \$1,081.71, with no debts."

IDAHO.

IDAHO COUNTY.

No wagon road will be built to Thunder Mountain this year. The 100-stamp mill, which is mostly at Emmett, will all be taken there and left there. Work may be done on the wagon road next May.

OWYHEE COUNTY.

The Silver City Avalanche has news of rich strike in the Poorman.

At Silver City the Nugget says that the recently organized Owyhee G. M. Co., which took over the group of claims on the west side of War Eagle, began work on the property last week by starting to clean out the 90-foot shaft to retimber it, and while awaiting the arrival of a whim the men began taking out the old, rotten curbing. At 20 feet from the surface a vein of quartz 20 inches wide shows value of \$75 per ton.

Twelve bars, each weighing 100 pounds, were shipped from the Trade Dollar mine on the 1st.

SHOSHONE COUNTY.

In previous recent issues considerable

has been editorially said regarding "the smelter trust," the subject having been gone into at considerable length, illustrative of its tendencies and inevitable effect, with some suggestions as to what was the best course for working miners and mine owners to pursue. During the closing week in July the Shoshone county, Idaho, commissioners met as a board of equalization to listen to arguments for reducing the assessment on sundry local mining companies. According to a Wallace special, dated July 26, to the Capital News, G. Ehrenberg, manager of the Helena-Frisco, developed the fact that the company had received \$18,000 from the American Smelting & Refining Co. last year as a bonus for not running. E. H. Moffet, manager of the Standard & Hecla, stated that the Hecla received pay from the smelter trust during the time it was idle, from May 30, 1900, to the time it commenced operating, three months hence; that all the Coeur d'Alene mines that had reduced their output on account of "overproduction" received approximately \$10 on each ton of concentrates that had been cut out of their production.

D. A. Hyman, president Frisco Con. M. Co., near Mullan, says he will start work about September 1, will employ 100 men, run about two-thirds full capacity, and ship 1500 tons a month.

At Orofino, E. E. Rogers, president Gold Creek Con. M. Co., has appointed H. Caulfield superintendent of the Mascot property, and ordered immediate resumption of the work.

Nearly all the machinery for the two dredgers being put in on Beaver creek, Delta, is on the ground.

After being shut down nearly one and one-half year the Hecla mill at Gem will start up next week.

MICHIGAN.

HONGHTON COUNTY.

At Houghton the Isle Royale M. Co. has discharged 100 men, closing down No. 1 shaft and slipping two of its mill heads. The cause is attributed to the low price of copper.

At Houghton the new compressor, recently installed at the Superior engine house of the Calumet & Hecla, replacing the old compressor, is doing nearly 200% more work. This compressor plant, which

is probably the largest in the world, was originally intended to operate 500 drills, but more than 300 have never been successfully operated. The substitution of more powerful compressors will, it is believed, result in the fulfillment of the original purpose.

MONTANA.

BEAVERHEAD COUNTY.

Superintendent W. A. Helmhuether of the Montana C. & G. M. Co. states that work on the mines of that company, on Stone creek, has suspended indefinitely.

DALY COUNTY.

At a recent dinner given in honor of F. Klepetko, President Scallon of the Anaconda Co. took occasion to deny the reports that the new smelter was a failure. He claims that it has proven entirely satisfactory and has given much better results than was expected. There had been a statement sent broadcast that "the colossal smelter built by the Amalgamated Co. at Anaconda at a cost of \$900,000 is decreed a failure. The old smelter was

abandoned six months ago, and all the saleable fittings were torn out; but Amalgamated workmen are now engaged in refurnishing and refitting the old smelter, as the new one must be abandoned for purposes of reconstruction."

It is locally reported that the Amalgamated Copper Co. may be compelled to abandon the smelter at Great Falls, because of the objections of the Government to the fact that the smelter is polluting the river and making the water unfit for irrigation, and is also killing fish. It is said to be probable that all ore of the Amalgamated mines will be treated in Anaconda and that the old works may be refitted for that purpose.

FERGUS COUNTY.

The Montana & Texas G. M. Co. has properties in Moccasin mountain, nearest railroad point Lewistown, 20 miles distant from Kendall. The mine has been developed to a depth of 250 feet. The ore lies in one deposit like a mountain. One man breaks all the ore needed to run a 250-ton mill a day. It is an immense quarry. The values on top run \$6.50 a ton. The mill is turning out \$25,000 a month.

FLATHEAD COUNTY.

An item from our Cabinet correspondent in the issue of July 19, concerning the American Kootenai M. & M. Co., and the Mother Lode M. & M. Co., is objected to by an officer of those companies, who says that "those properties are being rapidly developed and opened up, and just now a completely equipped electrical drill plant is being installed on the property of the American Kootenai M. & M. Co., which will soon be in operation. Other material improvements are being made."

Four six-horse teams are hauling the product of the Snowshoe mine to the railroad at Libby. The production of the property keeps about 150 tons ahead of the teams.

Placer ground on Libby creek is being worked this year as it never has before since the early sixties. F. Whiteside and Vaughn and Greenwell have a large number of men at work, with plenty of water.

GRANITE COUNTY.

The Montana G. M. Co. is operating the Sunday claim between Drummond and Phillipsburg. There is a tunnel 350 feet long on the Sunday vein; near the face a winze is down to the 100-foot mark, all the work in ore. A carload of the best ore shipped to Butte netted \$1950.

The Henderson M. Co. has organized at Phillipsburg and will put in a new plant on the Sunrise mine.

Near Phillipsburg, Maryland men have control of the Howard Copper Co. Dehts have been adjusted and funds provided for work. H. Busch is superintendent.

LEWIS AND CLARKE COUNTY.

A waterfall for the purpose of supplying power is now being created at the headwaters of the Little Blackfoot river, 30 miles west of Helena, where miles of flumes and ditches are being constructed, by means of which a number of small streams are being brought together and carried 5 miles to the mouth of Hat creek over a fall of 500 feet. Here a power plant will be erected, and it is calculated that there will be 1000 H. P. available, the current generated to be transmitted 10 miles to the Porphyry Dike mines.

MADISON COUNTY.

Near Virginia City Superintendent Baier has dredger boat No. 2, owned by the Conrey Placer M. Co., dredging for gold. The properties of the Copper Chief M. Co. are at Silver Star. The group comprises five claims. Development work has been done on the Copper Chief, on which there are two vertical shafts, aggregating 235 feet.

W. T. Hale has a bond on a group of claims 6 miles east of De Borgia. Four tunnels are being driven on the property.

NEVADA.

ELKO COUNTY.

The Dexter mine, near Tuscarora, is employing seventy-five men, handling 130 tons of ore and 40 tons of slimes daily, in addition to development work.

ESMERALDA COUNTY.

Near Hawthorne, Supt. Colcord of the Esmeralda M. Co. has men surveying a route for a pipe line from Cottonwood canyon to Hawthorne district. As soon as the pipe line is laid, a 20-stamp mill will be built near the Pamlico mine and work on the mines begun.

HUMBOLDT COUNTY.

General Manager Dunaway of the NCO says there are 250 miners in the camp of Donnelly mountain. The road from Amedee, Lassen Co., Cal., is said to be good and water plentiful.

LINCOLN COUNTY.

The Quartette M Co. at Searchlight will sink the main incline shaft to the 750 level from its present depth at the 450

level. The train is carrying seventy tons of ore to the mill daily, making two trips. This will keep the twenty stamps dropping regularly. An 11,000-gallon oil tank to supply the locomotive is to be built. The consumption is about 1000 gallons per day.

The Duplex Co. is working thirty-four men. A 16 H. P. gasoline engine runs a 12 K. W. generator. The power developed is utilized to run the drill, fan, pump and 100 lights in the mine, mill and the company's houses. S. C. McCummings, foreman, says that with the electric drill they are putting in a round of twelve holes, each 4½ feet deep, in twelve hours. The motive power is furnished by a 2 H. P. motor, from which a flexible steel shaft connects with the drill. Starting with a 3½-inch bit, it is gradually reduced to 1½ inch. The drill itself is clamped to the column, which is in turn jacketed between the walls. Along this column the drill is movable, thus making it possible to put in a line of holes with one set-up. One man has charge of the motor and watches the drill, while another is at the controlling handle which governs the feed.

The Bristol Copper M. Co. reports a strike made on the 600-foot level. Development shows it to be larger than the old Bonanza ore shoot. The work has been done under the supervision of Superintendent Klingender.

NYE COUNTY.

Tonopah is locally expected to rival the Comstock, from one of whose mines—the Con. Cal. & Virginia—were extracted 119 tons of gold.

At the time of the latest issue of the Bonanza the main shaft was 380 feet deep, the crosscut 450 feet. The foundation is completed. A 40-foot galloways-frame, 12 inches square, now building, will be replaced by one of steel when the ordered material arrives.

The Tonopah N. S. T. & D. Co. is sinking a farther distance of 200 feet to the 600 level.

Tonopah proposes to incorporate as a town.

At Duckwater is reported a deposit of potassium and sodium nitrate. W. H. H. Rhodes of Stockton, Cal., G. S. Garcia and E. S. Farrington of Elko have formed a company for the development of the property and have men at work. The following is furnished as an analysis of a crude sample of the new discovery: Nitrate of potash and soda, 78%; moisture, 9.2%; iron, trace; insoluble impurities, lime, silica and alumina; contains no chlorides; reducing power as compared with niter, 72.4%.

The Lucky Jim, Jack Rabbit, Idahoan, Little Tonopah, Little Tonopah No. 1, White Elephant, Samson, Nevada Boy, Tonopah Belle, Cronje Rose and Mining Chance claims will be incorporated as the Montana-Tonopah M. Co., and comprises among its shareholders C. E. Knox, C. Morris, Dixon, Ellis & Ellis of Salt Lake, Utah, Forman Bros., A. G. Cushman, H. Gates, T. Fleming, J. L. Butler, T. L. Oddie, T. McCahe, W. Parker, L. Ellis, H. C. Cutting and J. O'Toole. It is intended to sink a double-compartment shaft within 500 feet of the Mizpah.

The Bonanza reports the main shaft of the Tonopah Co. at a depth of 380 feet; the crosscut extends 450 feet. The amount of work since January 1st amounts to 3600 feet. The foundation for the new 44 H. P. hoist is completed. At the main shaft is building a 40-foot galloways frame.

Tonopah's present population is about 3000.

STOREY COUNTY.

At Virginia, Supt. Kinkead will put on a night shift to keep the Kinkead mill running constantly on Con. Cal. & Va. low-grade ore.

WASHOE COUNTY.

Supt. Hopkins is developing the Great Western mine, at Steamboat; a 100 H. P. boiler will be put in, when he will put on a larger force.

At Reno the Nevada Mineral Exhibit Building has been closed until after the Pythian convocation. The exhibit has been sent to San Francisco.

The Con. Nevada M. Co., Wedekind, has for \$25,000 bought the Frier group of claims, southeast of the Wedekind mine. The company has two shafts down—one 180 feet deep, the other 164 feet. From the former a lateral has been run out crosscutting the south. Values running \$5 to \$8 a ton are being found.

NEW MEXICO.

GRANT COUNTY.

Lordsburg reports the United G. & C. Co. developing their Lordsburg and Virginia mines, Shakespeare district, under the supervision of B. W. Randall. The North American M. Co. is sinking on the Cohra Negra, adjoining; D. W. Briel is Supt.

The Belle and Last Chance mines, owned by the Michigan-New Mexico C.

Co., are being developed; a 150-ton concentrator will be put in; W. H. Stevens is Supt.

The International G. M. & M. Co. has designated O. R. Smith, with headquarters at Lordsburg, its New Mexico agent.

LINCOLN COUNTY.

The sale of the Old Abe mine, at White Oaks, to the Eagle M. Co. of Chicago, Ill., has been confirmed. The same company has also purchased the Helen Rae mine at Nogal. They will put in an electric power plant, operate the machinery and furnish power to other properties.

SANTA FE COUNTY.

Suit has sued to foreclose the liens on the Mountain King, Good Hope and Summit, a three-fourths interest in the Galena King and Silver King and a three-fourths interest in the Parnell mines, in the new placer district in this county, given, it is alleged, for advancing money for development purposes which, with interest from Sept. 30, 1895, amounts to \$20,899.

At Santa Fe the Pennsylvania M. Co. is incorporated, headquarters at Cerrillos, main office at Franklin, Pa.; W. A. Brown of Cerrillos is manager.

SOCORRO COUNTY.

(Special Correspondence).—The Helen M. Co., which had been closed down on account of the low price of silver, is making exhaustive tests and experiments with the cyanide process, and, if the experiments are successful, will start up again shortly. They are doing some development work in the mine at present, but not shipping any ore.

Graham, Aug. 1.

The new tramway from the Ambrosia mine to the Hardscrabble at Magdalena has been completed, a distance of 3000 feet. A chute drops the ore into the bins of the Hardscrabble and from thence by a gravity tramway into the bins on the railroad.

OKLAHOMA.

Complaint has reached the Interior Department from mine owners as to the difficulty of enforcing the law recently enacted by Congress for the protection of miners in the Territories. The law limits shots to be fired in the mines to one per day, and the mine inspector for Oklahoma says that if the law is literally interpreted the product of some of the mines, now 500 or 1000 tons per day, will be reduced to two or three tons per day. He suggests that the law be construed as if the word "one" were "once." This change, while permitting the usual number of shots, would confine them to certain periods of the day, and thus afford the desired protection to the mine workers.

OREGON.

BAKER COUNTY.

Sumpter reports the Maxwell mine, twenty-four mining claims, eight of them patented, sold to W. J. Johnson and G. L. Huntington of St. Paul, C. P. Berkey of Minneapolis and J. A. Ward of Toledo, Iowa; consideration about \$145,000, 10% cash. With the property go two mill-sites, two water rights, with ditches complete, a double set of boarding and bunk houses, assay office, ore bins, 10-stamp mill, fully equipped, stamps weighing 1080 pounds each, operated by water power, also provided with steam engine and boilers as auxiliary.

The Big Producer group of claims, Alamo district, is sold to W. R. Eisenhower, associated with J. R. Cassin, consideration given out \$15,000.

Sumpter reports ore from the Monumental mine assays 137 ounces silver, \$25 gold, 500 feet from the surface. Ore is a 4-inch streak on the foot wall. The balance of this vein assays \$25 gold and twenty ounces silver. Manager Allen is having the 4-inch streak of ore sacked for shipment.

C. R. Townsend has been engaged by N. H. Thihaut of the Don Juan to superintend operations there. The second pump used at the mine is in place and sinking will shortly commence.

In the Cracker-Oregon property Superintendent Cahle is crossing the vein to determine its width. The long tunnel has been put in condition and headwork is going on.

JOSEPHINE COUNTY.

The Hammersley or Daisy, Jump-Off-Joe creek, is out of litigation. It belongs to W. H. Emerson. The Hammersley mine will now be operated.

C. R. Ray of Gold Hill will dam Rogue river and build a ditch for mining, milling and other purposes. He has let a contract at Grants Pass for 140 M. feet lumber for the flume. It will require 500 men for a year.

The yield of placer gold from the 150 hydraulic mines, Josephine district, for this season, is reported 40% greater this year than in any past season, due to the heavy rains. Nearly all of the hydraulic

mines increased their equipment last summer.

At the Victor Junior mine, Grave creek, twenty stamps are to be added, a new hoist, engines, boilers, drills and a cyanide plant put in.

Platinum discoveries have been made in the Meredith placers of the Illinois district. The platinum of the Illinois is found with the black sand deposits on the serpentine bedrock.

The Eureka mine of Soldier creek has installed a 10-stamp mill.

The Golden Drift M. Co., which own and operate the Dry Diggings hydraulic mines, are building a power dam across Rogue river, 3 miles above Grants Pass.

LANE COUNTY.

The Le Roy M. Co., head of Champion canyon, Bohemia district, will put in air compressor drills this month. The company will drive two drifts and from its lower tunnel will gain a depth of 1500 feet; it has three ledges that can be tapped from this lower tunnel.

SOUTH DAKOTA.

CUSTER COUNTY.

Shipments of mica have been resumed from Custer. For six months the mica mine owners of the district had been unable to dispose of their product at any price, and the mines had all been closed down. At Columbus, Ohio, the National Mica Co. is organized to meet the mica trust in the market for the Black Hills mica. The Black Hills Porcelain, Clay & Marble Co. of Detroit and Chicago has a written agreement with the National Mica Co. to sell the output of two mica mines at about \$75 per ton. Two hundred tons have been taken out of one of the mines, and is being shipped to Columbus. The two mines will give an output of three tons of mica per day. The books are uniform in size and are desirable for electrical purposes on account of freedom from iron.

LAWRENCE COUNTY.

The Homestake M. Co.'s 285th consecutive dividend is 50 cents per share—\$102,000—a total of \$15,388,950, without missing a monthly payment during twenty-three years and nine months. There are 900 stamps at work, one cyanide plant of 1200 tons capacity operating at Lead and another of 750 tons capacity almost ready to run at Gayville, these being designed to handle the tailings of the stamp mills. It is locally estimated that there is ore enough blocked out above the 1100-foot level in the mine to run the present mills for twenty-five years.

UTAH.

BEAVER COUNTY.

At the Ben Harrison Manager Trenam will put in an 80 H. P. boiler, 6x8 foot hoisting engine, a 10 H. P. upright engine, an exhaust blower and a six-drill air compressor.

IRON COUNTY.

G. E. Gunn, sent out by smelters to make reports on iron properties, states that, from present appearances of iron properties at Iron Springs, he would regard the proposition of furnishing iron ore for flux for smelters rather unfavorable, unless better showings are made.

JUAB COUNTY.

Near Eureka the Grand Central has decided to build an aerial tramway from the mine to the railroad, a distance of about a mile. The cost of the undertaking is estimated at \$20,000; it will have a capacity of 100 tons a day.

Litigation between the Bullion-Beck and the Gemini is settled out of court, the Gemini paying the Bullion-Beck \$30,000 and dismissing its counter claim. Through a mistake in the surveys each party had been extracting ore from the grounds of the other.

SALT LAKE COUNTY.

The Eagle & Blue Bell property may be transferred to the Bingham Con. Co. at \$2 50 per share for the capital stock. The Eagle & Blue Bell group adjoins the Centennial-Eureka, and like that property carries high-grade siliceous ores.

The Bulletin reports last week's product of the Bingham Con. smelter to be 124,000 pounds copper.

SUMMIT COUNTY.

Following are the shipments of ore from the Mackintosh sampler for the past week:

	Pounds.
Daly-West	3,541,000
Ontario	976,000
Anchor Con.	395,000
Total	4,912,000
Silver King	2,464,840

Total 7,376,840

At Park City the Record reports that at the California Superintendent Getsch has twenty-one men on a double-compartment

mont raise from the lower tunnel. The \$45,000 indebtedness will be cleared off.

TOOELE COUNTY.

At Marcus, Manager Bothwell of the Sacramento mine says that next month production of quicksilver from the recent find will be begun.

WASHINGTON.

FERRY COUNTY.

The Ohio G. M. Co., Republic, is showing well under development. Manager G. Pfunder has active charge of the work. Republic and Spokane are now joined by a daily train service.

At Republic the Quip is shipping ore. There are 2500 tons on the dumps.

Manager De Lashmott of the Princess Maud mine at Republic reports on the 650-foot level a pay shoot 4 feet wide, 90 feet long and 100 feet high. The ore will be shipped to the smelter.

PIERCE COUNTY.

The Tacoma Smelting Co., controlled by D. O. Mills and associates, will doubtless secure possession of the Tacoma Smelting & Refining Co.'s Tacomas smelter, having bid \$255,000 for its entire property. The sale of the smelter property was brought about by a litigation which followed the leasing of the plant by the Tacoma Smelting & Refining Co. to the Tacoma Smelting Co., the latter company having been formed by Mills and others two years ago to work the ores of a number of mines controlled by his syndicate. After the smelter was leased to the Tacoma Smelting Co., minor stockholders objected to the lease and took the claim into court. The litigation which followed became expensive; and to straighten out the tangle, it was finally decided to sell the smelter property. Of the two bids, one was from the Mills Co. and the other for \$250,000 from E. McGurran. As the Mills Co. has made the highest bid, and is also in possession, it will doubtless secure the smelter.

STEVENS COUNTY.

T. H. Schwelzer has a contract to supply the Canadian Smelting Works at Trail, B. C., with the lime rock necessary for fluxing purposes. The rock will be mined at the Northport quarries, for which the supply for the Northport smelter is now taken.

J. D. Farrell has bought thirty-one iron claims at Valley, north of Spokane, for \$30,000. The deposit carries 68% iron.

The King Copper & Gold M. Co., operating near Valley, will put in a four-drill compressor.

SNOHOMISH COUNTY.

At Silverton the Bonanza Queen Co. has completed a compressor plant; two drills are in operation; 300 feet has been driven. It is expected to drive this tunnel 600 feet farther to tap the ore body. R. V. Stretch is consulting engineer of the company and is preparing plans for flue line, tramway and concentrator plant with Manager A. W. Hawks.

WYOMING.

CARBON COUNTY.

At Grand Encampment T. H. Tracy of the Mine & Smelter Supply Co. is superintending enlarging the smelter to a capacity of 500 tons daily, and building a concentrator at the Boston-Wyoming smelter plant. The concentrator, 500 tons daily capacity, will be built in five parts—table room 50x18 feet, crushing and sizing room 60x70 feet, breaker room 20x20 feet, power house 20x20 feet; another ore bin of 500 tons capacity will be erected.

The North American C. Co. will install a 1000 H. P. plant.

The construction of the aerial tramway to the Ferris-Haggerty mine progresses. The towers have been built 14 miles out and two tension stations on the fourth section erected.

FOREIGN.

BRITISH COLUMBIA.

At Texada Island the Van Anda is preparing to start up. An English company has the property. Two pumps are unwatering. The iron property there is shipping to Port Townsend. Seventy-five men are at work on the island.

Rosland's output of ore for the week ending August 2 is low, owing to the closing of the Le Roi for three days following the death of the late Superintendent Dunkle. The Le Roi sent out 2925 tons; Le Roi No. 2, 1470; War Eagle, 150; Giant, 150. Total for week, 4695 tons; year, to date, 189,631 tons.

At the Consolidated Cariboo Hydraulic Co.'s mine, Bullion, Cariboo district, Manager Hobson has an electric system to run the drills and light the pit and camp. The bedrock has been blasted out for 900 feet and a bedrock flume laid. This is the first season that any attempt has been made to wash the bedrock gravels; to do so it was necessary to blast out the bedrock. Close to the dump the flume is 70

feet below the surface of the bedrock and 20 feet at a point 900 feet farther up. The bedrock is an extremely hard red dolomite and in places red porphyry. Three electric motor drills were used to do the drilling. One of these drills puts in an 8-foot hole in 45 minutes.

C. H. Fisher of the Fisher Maiden-Troy Mines, Ltd., says that ore is being sacked preparatory to shipping to the smelter at Nelson or Trail. The company has a Crown grant for the group of claims comprising the Fisher Maiden property. To make the property productive as soon as possible and to assist in paying expenses of development, instead of continuing the tunnel under the old workings, a second tunnel has been started directly under tunnel No. 1. If the ore shoot of tunnel No. 1 is found to be continuous in tunnel No. 2, it is estimated that 17,050 cubic feet of ore will be blocked out between the two tunnels. Estimating 10 cubic feet of ore to the ton, would give 1705 tons. If assay values of \$80 to the ton are maintained, this block of ore would be worth \$136,000.

At Boundary Falls Manager Goodell of the Montreal & Boston Copper Co. is handling the ore from its Sunset mine and will add a second furnace to the smelter, capacity 500 tons a day. The new furnace will be 40x176 inches, of water jacket construction.

At Nelson a lease is closed for the Silver King mine for one year to M. S. Davis, formerly superintendent of the property, by the Hall M. & S. Co. The mine had been closed for several months.

About 110 tons of ore have been brought from the Eureka Copper Co.'s Comstock property, Quatsino sound, to the Crofton smelter, the first over-sea consignment to the Northwestern S. & R. Co. The Yreka Co. have decided not to ship any more ore from their Quatsino property until the aerial tramway has been constructed from the mine to the waterway.

From Rosland Manager MacKenzie reports that the estimated profit for June of the Le Roi amounted to \$87,000. First-class ore sent to the smelter, 11,479 tons, containing 6800 ounces gold, 11,100 ounces silver and 501,100 pounds copper, estimated profit, \$66,000; second-class ore shipped from dump, 3200 tons, giving 1590 ounces gold, 1693 ounces silver and 73,500 pounds copper, estimated profit, \$21,000.

MEXICO.

CHIHUAHUA.

Mining companies in the Minaca and Jesus Maria districts, Chihuahua, propose to connect the two places by a narrow gauge railway.

MICHOACAN.

J. G. Collinson, Supt. Louisa C. & G. M. Co. and Santa Emilia Copper Co., in a report dated July 1st, says of the work at Dona Louisa: Work has been driving in north side tunnel, now in 31 meters; timbering costs 86 cents Mexican per meter. The proposed winze will be sunk in ore. The tunnel face is being driven by contract at \$5 Mexican per meter.

SINALOA.

A company of Americans, headed by N. B. Atwood, has been organized with a capital of \$2,000,000 for the purpose of developing mining claims about 40 miles northwest of San Jose, in Sinaloa. Included in this work is the construction of a tunnel through a mountain for a distance of about 2 miles. It is estimated that the cost of constructing this tunnel will reach about \$5,000,000.

J. A. Kilton, an American, has a concession from the Government for metallurgical works at Matehuala, to smelt 200 metric tons of ore daily. The plant will cost about \$100,000 gold. The terms of the concession require that the works shall be in active operation by the end of 1903.

SONORA.

New York men have closed a deal for the purchase of the silver mines owned by the Corona M. Co. Horace Gerber of Parral, Mexico, one of the owners of the Two Republics mine in Sonora, is at the head of a company which proposes to erect a large mill and smelter in Sonora.

Thomas F. Turner of Canton, O., has closed, on behalf of a New York company, several mining deals, one for the purchase of the Progreso and Colorado mines, in the vicinity of Batuc, Ures district, ores principally high-grade silver. The Colorado mine is an extension of the Progreso. The price paid for the Progreso is \$100,000, Mexican money, and for the Colorado \$30,000. The reduction plant of P. Osterman at El Cajon, near Susqui de Batuc, and the Zaragosa mine, in which P. Osterman was interested, are included in the deal. The Mina Grande and Santa Teresa properties, 18 miles southeast of Hermosillo, carrying copper ores, were also among the properties secured, price \$100,000.

In Magdalena district, the American-Mexican Copper Co. has bought from J. B. Storman copper properties in the Gua-

raguave mountains, 11 miles from Llano station. The Gold Galore M. Co. has also acquired from him gold properties 15 miles westward from the same station. The copper properties include 485 pertenencias of ground, carrying 6% copper. The gold property embraces 157 pertenencias, ores averaging \$15 gold. A railway 26 miles long, crossing and connecting with the Sonora Railway at Llano, is included in the enterprise. Of the American-Mexican M. Co., C. W. Warfield, of San Diego, California, is vice-president, and J. Lightner, of the same place, secretary.

ZACATECAS.

Norwood & Erikson, Americans, who own mines in the Sombrete district, have a concession from the government of the State of Zacatecas for building and operating smelters near Chalchihuites to cost about \$1,000,000.

SOUTH AFRICA.

Consular Agent Gordon cables from Johannesburg that a majority of the Chamber of Mines there favors the imposition of a coast duty of \$1.80 per case on dynamite, to protect local factories. A strong minority desires free trade. The annual consumption is 300,000 cases. Mr. Gordon thinks United States factories should compete for this trade, and requests cable quotations from manufacturers for blasting gelatine and No. 1 dynamite, 30,000 cases yearly, five-year contract, delivered at an African port. These figures, he adds, apply to one group of mines only.

A. Kinkead states that the milling plant of which he is manager, near Johannesburg, crushes 2500 tons of ore every twenty-four hours, and that contracts have been let for increasing the ore-handling capacity to 5000 tons in twenty-four hours. When this addition is made the mill will have a complement of 880 stamps. The ore carries an average gold value of between \$7 and \$8 per ton. The company has sunk drill holes to a depth of 4800 feet, which show the ore continues even below that depth.

THE PHILIPPINES.

J. D. Hartwell, formerly of Philipsburg, Mont., now prospecting for gold in the Philippines, says he saw some gold ore in Bagio Benguet province a short time ago that was rich. The streak from which the rock was taken is only one-half inch wide, but full of gold.

Personal.

J. D. HAGUE is in San Francisco.

E. W. CLARK is manager Ophir Hill mine, Ophir, Utah.

A. LEJUNE is manager Brunswick M. & M. Co., Pitkin, Colo.

W. A. ADAMS is manager Rambler-Cariboo Co., Kaslo, B. C.

C. H. PALMER is in Idaho examining the Copper Queen group.

ERIC MORRISON is manager Silver Wave M. Co., Danby, Cal.

THOS. FINNEGAN is superintendent Del Monte M. Co., Yuma, Ariz.

M. P. DALTON has returned to Denver, Colo., from an Eastern visit.

HENRY NESS is foreman Nutting Smelting Co., West Jordan, Utah.

W. D. PARKER is the new manager Ophir mine, Stateline, Utah.

J. E. PRICE has returned to Denver, Colo., from Jacksonville, Or.

G. T. RIVES is examining mining property near Guaymas, Mexico.

J. R. WALLS is the new manager Arizona mine, Silver City, N. M.

D. G. DICKINSON is superintendent Butterfield M. Co., Osceola, Nev.

E. C. UREN has returned from Spokane, Wash., to Grass Valley, Cal.

MENNO UNZICKER is now in charge of the Cable Cove mine, Sumpter, Or.

JAMES CRONAN has been appointed superintendent Bodle mine, Bodle, Wash.

W. D. HIGGINBOTHAM is superintending placer operations at Whiterock, Nev.

JOHN GARVEY will superintend reopening Blue Gravel placer mine, near Yreka, Cal.

A. MAZE succeeds H. D. Trennam as superintendent Stockton mine, Stockton, Idaho.

H. CANFIELD has been appointed superintendent Mascott property, Oro Fino, Idaho.

S. A. EASTON of San Francisco is assistant manager Bunker Hill Co., Kellogg, Idaho.

EDMUND PRIOR, B. C. Minister of Mines, is touring the Boundary, B. C., district.

ALEXANDER BARING of London, Eng., is visiting the North Pole mine, Sumpter, Or.

W. P. DUNHAM has been elected gen-

eral manager Independence Con. M. Co., Colorado.

N. BOSSEN is consulting and electrical engineer Calumet & Hecla M. Co., Calumet, Mich.

PROF. N. R. LEONARD, president Montana School of Mines, has returned there from the East.

J. L. WELLS has resigned the superintendency of the Con. M. & S. Co., Cerrillos, New Mexico.

C. M. SAIN of Lovelock, Nev., has returned from a visit to his mineral properties near Oregon.

JOS. SCEILI is superintendent Black Bess M. Co., Twin Lakes, in Big Cottonwood canyon, Utah.

F. W. BATES of Bogart & Bates, engineers, has returned to Seattle, Wash., from San Francisco.

H. C. CROUCH has been elected assistant professor mechanical engineering, University of Colorado.

F. M. DOWNER of Longmont is said to be slated for the position of assayer of the mint at Denver, Colo.

S. W. KEMPTON has returned to Los Angeles, Cal., from an examination of Ely, Nev., mining property.

CHAS. W. COMSTOCK has resigned the chair of mining engineering at the State School of Mines, Golden, Colo.

BEN STANLEY REVETT has returned to Breckenridge, Colo., from an eight months' trip to Africa and Asia.

W. WESTON of Denver has been making an examination of the Druid Co.'s property, Clear Creek county, Colo.

J. H. STURTEVANT of Denver, Colo., supersedes D. F. Wedekind at the Great Western Co.'s property, Copley, Cal.

TITUS CORKHILL is superintendent Boston & South Dakota Co., Lead, S. D., where he is operating the Minerva mine.

W. M. BLOOMER is superintendent Northwestern G. M. & M. Co., who own the Scott and O. K. tunnels, Wall Street, Colo.

JOSEPH H. YOUNG is the new superintendent of the Rio Grande Western Ry., with headquarters at Salt Lake City, Utah.

F. R. CULBERTSON has gone from San Francisco to Dedrick, Trinity county, Cal., where his Chloride-Bailey mine is situated.

E. G. WILLIAMS, engineer and superintendent Caribbean Manganeese Co., Colon, Republic of Colombia, S. A., is in Auburn-dale, Mass.

JOHN H. MACKENZIE says he will retain the management of the Le Roi Co.'s business at Rosland, B. C., and Northport, Wash.

W. M. SIDNEY is local manager at Georgetown, Colo., for the East Argentine Tunnel, Mining, Milling, Power & Transportation Co.

E. W. HAYNES, president Chicago & Sonora G. P. M. Co., is at Saqui Grande, Sonora, Mexico, superintending construction of sluices, dumes, etc.

W. L. BELL has resigned the superintendency of the Candelaria M. Co., Juarez, Mexico, and gone to New South Wales in a similar capacity.

J. H. COLLIER has resigned as Supt. Tesla coal mines, Tesla, Cal., and has charge of a cyanide plant at the Golden Eagle mine, Hayden Hill, Cal.

E. B. SAWYER has resigned his position with the Horseshoe M. Co., Pluma, South Dakota, because of the serious illness of his father, and is at present residing at Lincoln, Neb.

LEO VON ROSENBERG left New York on August 2 for Colorado to examine several mining properties in that State. Later he will visit California and go thence to Mexico.

PH. REARDEN, late Supt. Kurtz-Chaterton mines and mill, at Encampment, Wyo., has been appointed superintendent Coldwater and Kalamajor C. M. companies, at Pearl, Colo.

T. P. CULLEN, formerly with the Northern Pacific Railroad at Helena, Mont., has been appointed superintendent Los Angeles, Cal., division of the Salt Lake, Utah, road vice A. R. Oster.

R. A. PARKER, president Am. U. & L. S. Co., who has been seriously ill, finds his removal from Boston to New Mexico enabled his recovery from pleuro-pneumonia. He is now at Fort Churchill, Nev.

PROF. SAMUEL B. CHRISTY, dean of the mining college, University of California, has returned from New York City. While there Prof. Christy was the recipient of the highest honors and degrees in the gift of Columbia College.

TITUS ULKE, metallurgist of the Clergue works at Sault Ste Marie, Ontario, is at Grand Forks, B. C., with a proposition to treat its blister copper at

the Clergue refinery. The monthly output is 1500 tons of blister copper, including the gold and silver values. At present the product is treated in New Jersey.

A. E. WELBY, of Salt Lake, Utah, gets \$12,000 per annum in his new position as general manager Peruvian railroad interests of the McCune-Haggin firm. The first lot of material he will buy will be 110 miles of eighty-pound steel rails with all fastenings and necessary track material; 290,000 cross ties; six locomotives of special construction; twenty-five coal cars; twenty-five dump cars; fifty flat cars; twenty-five box cars; ten hand cars; one combination baggage and mail car; two second-class coaches; two first-class coaches; three cabooses.

MONTANA'S Governor has appointed the following as delegates to the Mining Congress to be held at Butte next month: W. A. Clark, John Gillie, C. W. Goodale, H. L. Frank, T. W. Buzzo, F. A. Heinze, W. Scallon, D. B. Gillis, Butte; W. G. Conrad, L. S. Stockett, Great Falls; W. R. Allen, Anaconda; W. J. Stevens, Missoula; S. A. Barbour, Glendale; P. Fusz, Granite; P. Missigbrod, Garnet; E. Larable, Deer Lodge; D. G. O'Shea, Red Lodge; E. W. King, Lewiston; O. A. Sparta, Hassell; D. P. Bowers, Libby; D. Folsom, White Sulphur Springs; R. W. Noble, Whitehall; L. Spanheim, Basin; C. W. Hoffman, O. M. Chisholm, Bozeman; T. S. Hauser, A. Burrell, J. Byrne, H. Welch, Helena; W. W. Morris, Pony.

Commercial Paragraphs.

W. R. MARTIN, Western representative F. C. Austin Manufacturing Co., has an \$80,000 contract to drill four wells 1000 feet deep for water at Cairo, Egypt.

ALFRED ATWOOD, chief engineer Rio Tinto Co., Huelva, Spain, is reported as desiring catalogues, etc., of American machine tools, sawmill machinery and general railway material and track tools. There is a demand reported for shovels, jacks, hammers, trucks (2-foot gauge) and all kinds of material used in the mines. Other large firms in that district are Campania de las Minas de Binton, Huelva; Minas del Banco de Castilla, Penarroya; Sociedad de Gararoz, Galaroz; Huelva Central Copper M. Co., Ltd., Cueva la Mora; Rio Tenido Copper Mines, Ltd., Huelva; Minas Pena del Herrero, Rio Tinto; Campania Minera Soliel Conada, Huelva; Tharsis Sulphur & Copper Co., Ltd., Huelva, Tharsis and London.

THE Crocker-Wheeler Co. of Amper, N. J., is finding an ever-increasing demand for its various lines of direct-current machinery. A new building, now half way to the roof, will nearly double the present capacity, and by clearing out many small machines in the main shop will permit of the placing of new and heavier machinery to accommodate larger sized generators and more rapid work on large orders for the smaller standard machines. The new building is of brick, slow burning mill construction, three stories in height and intended for the winding departments and light machine tools. The proprietors write: "A portion of the basement space will be used for the experimental laboratories whence emanate the changes in design that maintain the reputation of Crocker-Wheeler apparatus for embodying features which the best of engineering experience approves."

THE W. J. Clark Co. of Salem, Ohio, who make the improved fire hose couplers known as the "Quick as Wink," report a fine trade in those couplers lately. The demand for them has been growing steadily since their first introduction some years ago, but too slow for much profit until within the past few years. The couplers have advertised themselves splendidly in cities and towns where they have been in use, so that now the demand for them has made it necessary to increase facilities for turning them out. The Clark Co. are to be congratulated on the excellent satisfaction their couplers have given in towns and cities where they have been in use. In some sections it has been and still is difficult to get fire departments to make a trial of the improved couplers, on account of the general supposition that there can be nothing better than the screw couplers which are in common use. The manufacturers write that in every case where a trial of the "Quick as Wink" couplers has been made, screw couplers have been discarded and the "Quick as Wink" retained, their greater convenience of use, quicker action, unflinching durability and reliability for service commending them to practical men.

Latest Market Reports.

SAN FRANCISCO, Aug. 8, 1902.

METALS.

SILVER.—Per oz., Troy: London, 24½d (standard ounce, 925 fine); New York, bar silver, 52½c, refined (1000 fine); San Francisco, 52½c; Mexican dollars, 43½c San Francisco, 41½c New York.

At Denver, Colo., S. Guggenheim, who is there looking after the interests of the American Smelting & Refining Co., of which he is an official, says that the company has just closed the sale of 20,000 ounces of silver to the Mexican Government, in addition to 5,000 ounces recently delivered. He declares that the first sale increased the market price of the metal 2 or 3 cents, and predicts a still greater rise as a result of the late deal.

COPPER.—New York: Standard, \$11.50@11.60; Lake, 1 to 3 casks, \$11.75; carload lots, \$11.50; Electrolytic, 1 to 3 casks, \$11.75; carload lots, \$11.60; Casting, 1 to 3 casks, \$11.75; carload lots, \$11.50. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £52 12s 6d spot, per ton.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £11 1s 3d per ton.

SPELTHER.—New York, \$5.37½; St. Louis, \$4.50; London, £18 15s per ton; San Francisco, ton lots, 5½c; 100-lb. lots, 6½c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 100-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$28.60; San Francisco, ton lots, 30½c; 1000 lbs., 30½c; 500 lbs., 31½c; 200 lbs., 35c; less, 32½c; bar tin, 3½c. London, £127 10s spot.

PLATINUM.—San Francisco, crude, \$18.00 per oz.; New York, \$18.50 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$48.00 large lots; London, £8 15s; San Francisco, local, \$46.00 per flask of 76½ lbs.; Denver, \$50.00. Export, \$44 50.

BABBITT METAL.—San Francisco, No. 1, 10½c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 4½c.

SOLDER.—Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100-lb. lots, 16½c.

NICKEL.—New York, 50@60c per lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.50; gray forge, \$21.50; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$32 and \$33; open hearth billets, \$34.00; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, \$2.75; K. B. & S., \$2.75; Hemmoe, \$2.70; Trowell, \$2.70; Portland, \$3.25 per bbl.

LIME.—Santa Cruz, \$1.85; Roche Harbor, \$1.85 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, \$20.00@22.00; extra sizes higher; redwood, \$22.00@23.00; lath, 4 feet, \$4.25 @4.50; pickets, \$19.50; shingles, \$2.35 for No. 1 and \$2.00 for No. 2; shakes, \$13.50 for split and \$14.50 for sawed; rustic, \$26.00 @32.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, \$3.50; Cut, \$3.50; 10d to 16d, Wire, \$3.55; Cut, \$3.55; 8d, Wire, \$3.60; Cut, \$3.60; 6d and 7d, Wire, \$3.70; Cut, \$3.70; 4d and 5d, Wire, \$3.80; Cut, \$3.80; 3d, Wire, \$3.95; Cut, \$3.95; 2d, Wire, \$4.20; Cut, \$4.20. Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. O. B. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder

in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg. CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000. FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c per set; 14 oz., 40s., 9c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$7.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$11.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$13 per ton in bulk, \$15 in sacks; Sunnyside, \$11 50, long ton.

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 27@28c per lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 66% B, 2c per lb.; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 2½@3c per lb.; blue vitriol, 5½@6½c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, \$2.00@2.25; flour sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.25 @1.50 per 100 lbs.; sks, \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 73c; cs., 78c; raw, bbl., 71c; cs., 76c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 64c; cs, 70c; raw, bbl., 62c; cs, 67c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls, 19c; wooden bbls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22c; Lard Oil, No. 1 bbl., \$1.00; cs., \$1.05; Neats-foot oil, bbl., 70c; cs., 75c; No. 1 bbl., 62½@65c; cs., 67½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6½c; 1 ton and less than 5 tons, per lb., 6½c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7½c; less than 500 lbs., 7½c.

ASSAY LITHARGE.—Per lb., 8½c. BISMUTH.—Subnitrate, per lb., \$1.60. BONE ASH.—4c per lb.

BORAX.—Crystal, 7c; calcined, 25c.

COPPER.—Carbonate, 20c; Red oxide, 60c.

MAGNESIUM.—Per lb., \$3.00.

MANGANESE.—(90% and over) per lb., \$1.25.

MERCURY.—Bichloride, per lb., 90c.

MOLYBDENUM.—25c. per gramme; 1000 grammes—2½ lbs.

PHOSPHORUS.—(American) per lb., 80c.

SILVER.—Chloride, per oz., 75c; nitrate, 55c.

SODIUM.—Metal, per lb., \$1.00.

URANIUM.—Oxide, per lb., \$3.50.

ZINC.—Metallic, chemically pure, per lb., 50c.

ZINC.—Dust, per lb., 10c.

ZINC.—Sulphate, per lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ROTARY GROOVING TOOL.—No. 705,268. July 22, 1902. A. R. Meisler, Sacramento, Cal. This invention refers to improvements in wood-working tools of the class known as "jiggers," and is designed to provide a simple, light rotary cutter, that can be held in the hands, and which is capable of use wherever an irregular groove or channel is to be cut. It is especially useful for coach and carriage manufacture where it is designed to mortise the parts intended to receive the edges of the panels the latter being curved not only along their edges, but transversely. The handle is adapted to be engaged at either end and carries a revolvable cutter turnable in a plane parallel with the handle, and it has transversely extending means between its ends for supporting the cutter. Pulley or anti-frictional devices are interposed between the flange of the shaft and the outer, and flexible connections are made between the cutter and source of power by which it is revolved.

GAME BOARD.—No. 705,778. July 29, 1902. F. E. Morrill, San Francisco, Cal. This invention relates to boards adapted for marking points for crinane and similar games. It consists of a board having two end sections and an elevated central section, each having point marking holes made in its surface and thus divided into three independent sets. Transversely through the board from one side to another is made a plurality of openings of suf-

ficient size to receive packs of cards and spring or equivalent pressure devices to prevent their slipping out too easily. Other openings are made for containing the pins used in marking counts, and these are provided with closable covers.

HYDRAULIC DREDGER CUTTER.—No. 705,784. July 29, 1902. R. A. Perry, Oakland, Cal. As signor of one-half to Atlantic, Gulf & Pacific Co., of New York and San Francisco. This invention is designed to provide an improved method in the cutters used in rotary hydraulic dredgers by dispensing with the rings, bars or support frameworks which are ordinarily employed in such cutters. In this invention the cutters are fixed to or formed upon the ends of radial arms without other attachment, and are so disposed with relation to the mouth of the suction pipe that material can be excavated and broken up and delivered into the suction pipe without any risk of clogging or necessity for stopping the machine to clear it of obstruction.

ADJUSTABLE CRUTCH.—No. 705,741. July 29, 1902. W. F. Drew, Sacramento, Cal. One-half assigned to F. G. Snook of same place. This invention is designed to provide a crutch which is adjustable for any person, tall or short, who may be desirous of using it. It consists of tubular telescopic leg portions, the outer of said portions being slotted longitudinally, and a hand-hold extends transversely between the legs and is provided with terminal bands enclosing the slotted portions. A clamp mechanism is carried by the hand-hold by which the slotted portions are contracted and locked upon the slidable parts. The upper and lower members are slidably movable to lengthen or shorten the crutch, and these parts are clamped in any desired position by screwing up the hand-holds.

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING JULY 29, 1902.

705,811.—INSULATOR—J. S. Allen, Los Angeles, Cal.
705,808.—FEEL TROUGH—J. W. Barnes, Beaver-ton, Or.
705,553.—HOPPLE—H. A. Bostwick, Spokane, Wash.
705,736.—RIFLE—J. H. Carl, Gilroy, Cal.
705,644.—ROTARY ENGINE—J. E. Cary, S. F.
705,741.—CRUTCH—W. F. Drew, Sacramento, Cal.
705,634.—BICYCLE—F. Good, Shelburn, Or.
705,933.—TRAP FLUSH—J. E. Key, S. F.
705,787.—FRUIT DRIER—C. J. Kurtz, Salem, Or.
705,937.—SOLDERING MACHINE—J. Lee, S. F.
705,778.—CONVEYER—W. L. McCabe, Seattle, Wash.
705,776.—GAME BOARD—F. E. Morrill, S. F.
705,784.—DREDGER CUTTER—R. A. Perry, Oakland, Wash.

Obituary.

W. S. GODBE, a prominent Utah and Nevada mining man, died at Brighton, Utah, on the 1st inst., in the sixty-ninth year of his age. To him, as much as to any one man, is due the development of Utah's mining interests.

SITUATIONS WANTED.

Chemist and Assayer with five years' experience in both mine and smelter work desires position. Technical graduate; finest references. Address "Chemist and Assayer," care of this office.

WANTED.—An all-round miner wants position as foreman. Over 23 years' experience in practical mining and handling men. Best of reference. Address Call Box 29, Welser, Idaho.

WANTED.—Employment at mine by young, experienced Assayer, Surveyor and Bookkeeper. References. Address A. H., care of this office.

Position wanted by Assayer and Surveyor at present employed in Arizona. Will go any place. Few years' experience East and West, and a good technical education. Address A. B. C., care of Mining and Scientific Press.

WISH A POSITION AS SUPERINTENDENT or Assayer. Have had experience in mining, milling, cyaniding and smelting, and in putting up and running the machinery. Can sharpen tools Jesse L. Wetmore, 644 E. Main St., Stockton, Cal.

MINE FOREMAN.—Young man (33) with 14 years' experience as a practical miner in Montana, Idaho, Black Hills, Arizona and California, energetic and possessed of fair technical knowledge, desires position with some progressive company. Fully conversant with standard air drill and familiar with all systems of timbering. Would like position where progressive methods applied to economical extraction would be appreciated. Foreign countries not objected to. First-class references as to ability and general reputation. Address C. M. A., care Mining and Scientific Press.

A technically educated Mining Engineer, at present employed as superintendent of mines for one of the largest corporations in Mexico, desires a change of position to the United States about July 1st. Has had 18 years' successful experience as engineer and superintendent, never having made a failure; 36 years of age; strictly temperate; a skilled designer, geologist and metallurgist; and a practical miner, as well as a hard worker and thorough business man. References of the highest order, including present employers. Address Supt., care this office.

EXAMINATION OR SUPERVISION of Mines, Smelters and Mills.

Mining Engineer and Metallurgist, of unquestionable reputation and long experience, now permanently residing at Seattle, Wash., will accept or take general supervision of mines, smelters or mills, in Pacific Coast States, British Columbia or Alaska, as consulting engineer, for reliable parties. Is also reliable accountant to examine. Box 813, Seattle.

THE CALIFORNIA DEBRIS COMMISSION having received application to mine by the hydraulic process from Mrs. C. W. Porterfield and Jos. A. Jeffery, in the Hunker Gravel Mine, near Emigrant Gap, Nevada County, Cal., to deposit tailings in Diamond Creek, gives notice that a meeting will be held at room 96 Flood Building, San Francisco, Cal., on August 25, 1902, at 1:30 P. M.

Electrolytic Extraction of Copper.

In connection with the Marchese process, the electrolytic extraction of copper sulphides by various solvents has been investigated, and in connection with the Hopfner process the electrolysis of cupric chloride solutions has been studied. The London Electrical Engineer is authority for the statement that an artificial cuprous sulphide containing some cupric sulphide was electrolytically extracted with sulphuric acid of sp. gr. 1.225 (acid of maximum conductivity). On electrolysis, the ore being made the anode, a slime is deposited on it, which soon stops the current. This slime contains free sulphur, but it is shown from the analysis of the slime progressively deposited that the solution of the copper takes place in the two phases: (a) $\text{Cu}_2\text{S} + \text{SO}_4 = \text{CuSO}_4 + \text{CuS}$, and (b) $\text{CuS} + \text{SO}_4 = \text{CuSO}_4 + \text{S}$. Using current densities up to 30 amperes per square decimeter the sulphur could not be oxidized. Rise of temperature favors the passage of the current. The same cuprous sulphide was electrolytically extracted with 4.5 N sodium hydroxide, the sulphide in this case being the cathode. The sulphur passes into solution, leaving metallic copper in the residual slime. Since the slime in this case has not a high resistance, the potential remains nearly constant throughout the electrolysis. The current yield is at first good, but falls off, and it has further been observed that the current yield decreases as the current density rises. The cathode slime can then be easily dissolved electrolytically in sulphuric acid, and as it contains little sulphur the previous disturbing factor is removed. The electrolysis of cupric chloride was carried out with a solution of this substance, using a platinum cathode and a carbon anode in a porous cell. When the solution is stirred, it is found that rapid stirring diminishes the yield for a given current, but the copper deposited is purer because the cuprous chloride formed by the dissolving of separated copper by the cupric chloride is washed away from the deposit. In a series of experiments, the solution circulated through the electrolytic cell and passed into another vessel containing a copper plate, and the rate at which the copper dissolved was measured. To obtain constant results, the liquid must always circulate at the same rate. Addition of hydrochloric acid diminishes the current yield, but leads to a pure copper, because the cuprous chloride formed is retained in solution. When the concentration of acid is very

great, the current yield begins to increase slightly. Sodium chloride added to the solution also diminishes the current yield, but not to anything like the same extent as hydrochloric acid; the deposited copper is very pure. The current yield diminishes as the concentration of cupric chloride increases, and the copper deposited becomes more impure, for more cuprous chloride is formed, and it may even happen that cuprous chloride alone is deposited. It is not advisable, however, to diminish the concentration too much, for then the copper is deposited in a very spongy form. At a temperature of about 12° , the deposited copper is spongy; a coherent deposit is obtained at 25° , but as the temperature rises above this, the current yield diminishes and the deposit is not so pure. Increase of current density slightly increases the current yield, because the solubility of the copper in the electrolyte is almost independent of this density. At very high current densities, however, the current yield falls on account of the separation of hydrogen at the cathode. A deposit containing up to 99.98% of copper can be obtained from a solution containing 0.1 gramme-molecule of cupric chloride, 0.1 gramme-molecule of hydrochloric acid, and 0.4 gramme-molecule of sodium chloride per litre.

Mine Santa Maria del Oro, Durango, Mexico.

A Colorado Granite Quarry.

A granite quarry has been opened up on the line of the Colorado Midland Railway, within a few miles of Leadville, which is worth noting, the blocks being of unusual value on account of their peculiar formation. L. S. Atkinson of Colorado Springs began the active development of the quarry and the first building of any importance to be erected of the granite will be the new city hall of Colorado Springs, Colo.

It is a pure gray granite of even quality, stratified into layers of from 6 to 36 inches, and cut by nature into blocks as true as if by modern sawing machinery, running back into the mountain $\frac{1}{2}$ mile from its face where stratification was discovered. The wear of the weather has exposed the upper part of the deposit, allowing easy location of the stratified formation 1500 feet, and blasting and examination prove that there is neither change in stratification, color nor quality of the granite as far back as the investigations progressed. The close resemblance of the stone to Barre granite has resulted in the change of the name of the railroad station to Barre and the naming of the quarry "Colorado Barre."

The process of quarrying the granite is peculiar and interesting. An alley is blasted back into the mountain a short distance and, working in this, the quarrymen drill lines of holes in the natural bed of the perpendicular strata. Feathers and wedges complete the cutting, bars adjusted and the blocks, perfect and ready for placing in the walls, pried off in big layers. No blasting is found necessary, once the alley has been opened. The released blocks are hoisted by derricks and placed in the small cars ready for loading upon flat cars on the railroad below. Tests and measurements show that the natural beds of the released blocks are as true as if cut with saw or tooled off by hand. The variation in the thickness of stratified formations supports the claim that to follow building specifications it is but necessary to follow one or two of the layers of the required thickness, only using saw and tools for special pieces. For the accompanying view we are indebted to the courtesy of the Monumental News of Chicago.

Mine Santa Maria Del Oro.

The mine illustrated herewith is 56 miles from Rosario, the railroad terminus, and is near the divide between the Nazas and Florido rivers. A pyritic smelter is in operation and is a success. The furnace operating has been a forty-ton water jacket; recently replaced by a new sixty-ton furnace. The matte goes to Aguascalientes. The ore runs well in gold with a little silver and $\frac{1}{4}$ of 1% of copper.

It is to-day easier to get a mining property that will pay from 25% to 50% than to get hold of an ordinary business investment that will pay a sure 5%. And in the investment that pays 5% the investors or dividend receivers have to go down into the pockets of other men to get it—not in any wrong or dishonest way; they doubtless give and get full value, but, yet, the transaction is only a swap. The money taken from the ground is as much of a creation, so far as new money is concerned, as was the earth itself when it was created. The money so produced is an addition to the wealth of the world and helps not only him who produces, but him who receives it, and helps, too, every other industry, for every miner underground supports five people on the surface, and the bullion he produces is forevermore a part of the wealth of mankind. As for the gold miner, he produces the only thing that all men worship. Just 3303 years ago a temple was built to such worship, and it has been thronged with devotees ever since.

THE current number of Bradstreet's estimates that up to and including the first week of August the losses and expenses of the present coalminers' strike foots up \$68,190,000. While this is probably an exaggerated estimate, there is sufficient truth in the statement to show the tremendous loss that such a strife entails. The expenses of war are often cited to show the need of peace, but here is an industrial war that piles up losses in blood and treasure which tend to equal those of costly campaigns, and emphasize the need of arbitration and mutual agreement. In times of profound peace and busy industrial activity there is unavoidably a constant war of competition and individual pressure that is hard to stand and fearfully destructive to those unable to withstand it. Such conflicts as the prolonged one between Eastern coal miners and operators wreak ruin fully as dreadful as that between opposing armies in battle, and embrace in their destructive scope thousands of innocent outsiders.

THE froth is blown off the Thunder Mountain, Idaho, scheme. It is not without merit, but has been crudely "boomed." Early in the season the transportation companies saw a good chance for business; but, whatever the possibilities of the camp, the thing was almost immediately overdone, so far as miners making money out of it was concerned. At present the whole country is staked out by men who don't have to do any work thereon for ninety days, and some of whom expect to be able to enlist

the attention of capital. It is argued that already some moneyed men have put up so much that they can not afford to let the thing drop; but it is not well to count too much on that. There is an abundance of water, timber, high-priced provisions and disappointment, but little actual mining, and it is not a good place for a poor man. Later on, when there is more doing, when a stage line is in and people quit telling about wonderful finds of platinum, quicksilver, etc., that country may "boom" in the real acceptance of the term, but that will be after the glittering advertisements of fortunes made in a week come out of Eastern papers, and the men who do the mining get to work, if the prospects then justify it.

THE prospector has about as much advice given him as anybody. And considerable of it is worth just what it costs. There is advice enough on hand now to run him for a while. What he really needs more than good advice is good example. During 1902 he has been told, numerous, "Develop your claims." Might it not be well to bestow a little such admonition on the investor. Ordinarily the only thing that keeps a prospector from developing his claims is lack of money. Sometimes the man who buys the prospect for a very little and makes a mine out of it tells the prospector he was foolish to sell so cheap, which is adding insult to injury. In such a paper as this it is never of any use to point out a defect or want, without proffering a remedy or aid for its need. In this case the most likely benefit would be to interest the probable investor, not so much in buying a mine—a "going mine," as our European friends would say—as in developing mines. There is really more in it for capital in making a mine for itself than in paying big money for a property already developed and paying. For this reason this paper views with favor the organization of development companies that have ample money to invest, knowledge enough to invest it sensibly, and business patience enough to not be in too big a hurry for returns. Good mines can be made in the way indicated. There are plenty good prospects that deserve development, but it is little use to tell the prospector "Develop your claims." He has done pretty well to discover them. If he had the money to develop his claims, probably he wouldn't be a prospector. He is trying hard enough to develop them, but the way indicated would be more in the line of good business.

As is usual in all such cases by the American Co., since Marconi has demonstrated the commercial value of wireless telegraphy a host of claimants to the invention arise. Whatever domain of science shows advance is always thickly populated; whatever the invention there is sure to be "others." And naturally, indeed, inevitably so. In many inventions the device as perfected is necessarily built up on several experimental efforts on the part of men who have preceded in time the invention. Every one of those who are now said to have invented or discovered wireless telegraphy before Marconi have doubtless considerable claim to respectful attention. But as it was Marconi who first made practical demonstration, so it will be he who will always be associated in the public mind with the marvelous system of electric communication that he first gave to the world. There were steam engines before Watt, steamboats before Fulton, telephones before Edison, yet we always think of those men in connection therewith. Even a dwarf standing on the shoulders of a giant can see further than the giant himself. Whenever a new invention is made it is in the air. Progress, painful and obscure, has made that invention possible. A hundred keen intellects, apart and unconnected, are working on the same problem, and oftentimes two or more make the same discovery almost simultaneously. In this case Marconi developed the idea and first made it practical. To him, therefore, should be given much credit. And meanwhile credit should not be withheld from all or any of the patient investigators, pioneers in the pathway of slow science that made Marconi possible.

CESSATION of water supply in many parts of the Western mining country causes temporary suspension of placer mining and hydraulic operations in general, so far as actual output is considered; but

the general tenor of our correspondents' reports this week is to the effect that such enforced suspension will be utilized to good advantage in preparation for increased work next season, made possible by enlarged ditch and flume capacity and purchase of improved hydraulic mining appliances. Meanwhile, many other workers thus afforded temporary respite are using the time to good advantage in doing necessary assessment work to hold their own outlying claims, and others are only glad of the opportunity to "go prospecting." The fascination of a prospecting trip is known only to those who have been in one, and little wonder that the chance to thus get out is so eagerly seized by those who thus become the pioneer of the miner and all the industries the latter creates and maintains. The bulk of Western American gold has come from the placer mines, and while from the nature of things gold quartz mining will some day equal in value the placer product, there are even yet undeveloped and undiscovered areas of placer ground that will prove profitable. Every August, when the water runs low, there is a scattering out from closing-down placer properties that results the following year in the opening up of new prospects to add in their turn to the great aggregate of gold production.

THE West Australia report of the Department of Mines for 1901 contains some things noticeable in connection or contrast with similar publications issued in this country, illustrating tendencies and requirements usually absent in this country. Elaborate tables show the "averages of gold ore raised and ounces of gold produced therefrom per man employed," from which it is learned that "per man employed under ground" there were in 1901 raised 182.35 tons gold ore; "per man employed above and under ground," 93.87 tons. The number of ounces gold produced "per man employed under ground" were 209.89, and "per man employed above and under ground" 108.04. Comparison is made with similar tables for former years and the conclusion drawn "that better work is being done by the miners, and that more systematic methods of mining and ore reduction are practiced." During the year 20,895 men were engaged in mining, 11% of the population. In that time there were 175 miners killed and injured; there was a death rate of .34 of 1% per 1000 employed above ground, and 4.6% of those employed under ground. The State of West Australia gives aid to mining by building cyanide plants, and by offering subsidies for deep sinking. Values are given of the mining machinery erected in the different districts during the year, all mentioned being noticeably different from American custom in this regard, but not without value and doubtless in accordance with local requirements.

THIS is the age of standardizing. Weights, measures, instruments, machinery and other things are rapidly being standardized, and it would seem well to have advertising literature standardized, too. Nearly every mining machinery manufacturer and dealer feels it incumbent on him to get out what is called a "catalogue," though the splendid trade treatise of to-day does not deserve to be discredited by that name, for the brochures produced are sumptuous in style and finish, being expensive in proportion to their elegance. This office gets about three a day, approximating a thousand annually, and tries to keep some of them. So also do other offices and individuals, and the mining machinery men themselves essay retention of their rivals' literary productions. The time has arrived when it would be well to have some standard sizes for these handsome treatises. In the thousand or so annually received there are over 100 different sizes. It would enhance their value and be of manifest benefit if such idea were put in practice. As it is at present each one is a law unto himself. Some of the larger manufacturing and supply houses have already taken up the plan of issuing their catalogues in one of three sizes—either 3½x6 inches, 6x9 inches, or 9x12 inches. Six by nine inches is a good size, large enough for almost any such purpose and convenient to file. The idea is worth considering. Those catalogues are costly affairs and anything that would tend to get back at least the original investment is in order. The sizes suggested have been already recommended by many of the engineering societies of the United States.

Concentrates.

THE metric ton contains 2204 pounds.

THERE is no Norway iron now imported to this country.

ENGINEERING, commercially, is the art of making a dollar earn the most interest.

FREIGHT RATES from average Arizona points to El Paso, Texas, are about \$5 per ton.

THE tin ore at Temescal, Cal., is cassiterite or tin oxide, in fissure veins in granite formation.

IN hoisting a bucket that produces 900 pounds stress upon the manila rope, a 1½-inch rope would be the right size.

ASBESTOS FIBER, containing any portion of the non-fibrous rock, could enter the United States free of duty.

SHOULD a patent be issued for a millsite the fact that a vein or lode is afterward discovered on it does not invalidate the patent.

JADE or nephrite occurs in seams of trap rock in Wild Cat canyon, Esmeralda county, Nevada. The quality is dark, fine texture and takes a good polish.

SINCE the first issue of this paper the highest price paid for copper was in July, 1895—55 cents per pound; the lowest in June, 1894—9 cents per pound.

CANADA produces about half the world's supply of nickel. Now Caledonia, Norway, Austria, Germany and Spain yield about 40% of the refined product.

TRUE malachite has been found in considerable quantity at the Dixie copper mine, Washington county, Utah, and the Copper Queen mine, Bisbee, Arizona.

THE Mount Morgan, Queensland, Australia, gold mine treats about 18,000 tons ore per month, using the chlorination method and averaging nearly one ounce gold per ton.

AN unpatented mining claim is not subject to State or local taxation, but by subterfuge the assessor often taxes the possessory right, which often amounts to the same thing.

THE Stora Kopparberg M. Co. of Sweden has records showing the transfers of shares in the stock organization in 1288. It was chartered by the Scandinavian Crown in 1347.

A CONTINUOUS ELECTRIC CURRENT flows like a stream of water steadily in one direction. An alternating current flows by rising to its full voltage and then falling to its least.

ELECTRICIANS whose standing and reputation give value to their opinions express the belief that it is possible to insulate and transmit power at 100,000 volts for any distance required up to 400 miles.

WATER at ordinary temperature will act on cement, dissolving out .0014% of lime, but, percolating continuously through porous mixtures of cement and sand, will in time dissolve so much lime out of the cement as to weaken its cohesion.

IF when retorting quicksilver it flows or is greasy, it can usually be restored by covering it with about an inch thick layer of pulverized coke, or, better still, pulverized charcoal, the retorting to be done very slowly and at as low a temperature as possible.

FREIGHT on zinc ores from Colorado to Europe would be about \$10 per ton. Zinc ore carrying, say 55%, would be worth about \$30 per ton delivered at Antwerp. The Kootenay district in British Columbia has shipped lead concentrates to Antwerp via St. Johns, N. B.

JASPER is common in Utah, Nevada and Oregon, and near Burns, Cal., is a large dike of green jasper which cuts across a large area of country. This jasper takes a fine polish. Yellow, red, brown and green jasper are found in Nye county, Nevada, and Utah county, Utah.

IN a gas engine, when coupled to a dynamo, the gas used to drive it for the production of electricity yields three times as much light in incandescent lamps and about eleven times as much in arc lamps as the same amount of gas would give off if burned directly at gas jets.

THE longest span in any American electrical power transmission line is that of the Bay Counties Power Co., across Carquinez straits, between Suisun and San Pablo bays, California—4448 feet, at a height of 236 feet above high water mark. The transmission involves 40,000 volts carried 182 miles.

WHERE the ownership in the locations and the tunnel is the same, assessment work on one or more claims, whether adjacent or not, can be done upon a tunnel planned to cut the veins claimed in the locations, even though the entrance or some of the line of the tunnel is off the surface locations.

CALAMINE is the hydrous silicate of zinc. Its color is bluish, green or brown. It is transparent or translucent and has a vitreous or sub-pearly luster. Its gravity varies from 3.16 to 3.9; its hardness is 4.5 to 5. Its composition is zinc oxide, 67.5; silica, 25; water, 7.5. With the blowpipe it gives off fumes of zinc on charcoal which cover the coal.

REGARDING the use of sodium in blowpipe analysis there are different methods of using sodium as a reducing agent. Some prefer the following simple manner of operating: A piece of sodium, 3 to 4 mm. in diameter, is flattened out, the powdered substance to be tested pressed into it with the hammer, the whole turned over

with the blade of a knife, kneaded into a ball, placed upon a cavity in the charcoal and ignited, when with a flash the reduction takes place momentarily.

IN the case of the firm of New York brokers against Straub, the New York Supreme Court decided that delivery of a check on a bank does not constitute an assignment of the funds in the bank of the drawer of the check, and that a person withdrawing the amount to his credit in the bank by a second check, but prior to the payment of the first-drawn check, does not commit larceny.

COAL GAS is explosive when mixed with air in the proportion of one volume of gas to sixteen of air, this being the inferior limit at which combustion will take place when the gases are fired at atmospheric pressure. Any proportion between this and one volume of gas to four of air may be ignited at atmospheric pressure. The best mixture to use in an engine is about ten to one of gas, though this is necessarily subject to variation on account of the different qualities of gas produced from coals of different grades.

THE easiest and most economical way to increase the power of a steam engine is to increase the boiler pressure, but it is necessary to be sure that such additional pressure may be carried, and that can only be ascertained by careful and rigid inspection. It takes but a trifle more fuel to carry steam at 110 pounds per square inch than it does at 100 pounds, but no increase of power can be obtained without an increased consumption of fuel. In the way instanced, it would not be necessary to increase the speed of the engine, nor change the driven pulley on the line shaft, simply meeting an increase of resistance by an increase of steam pressure.

A PNEUMATIC rock scraper is an appliance in use on a gold dredger. The dredger on which it is used consists of three pontoons, instead of two, so that two wells are provided. One well accommodates the bucket ladder, the other the pneumatic scraper. The apparatus consists of an iron tunnel, swinging upon an axle, which allows the lower end of the tunnel to be raised or lowered at will down to a depth of 65 feet. The tube is let down flush onto the bottom after the buckets have done their work, and the water is then expelled by pneumatic pressure. Men can then enter the tunnel and work at the bottom, scraping out the cavities in the rock which can not be reached by the buckets.

IN Colorado the statute fixes the miner's inch as equal to a quantity of water flowing from an inch-square orifice under a pressure of 5 inches above the top of the orifice, and assumes that the quantity of water delivered is proportional to the area of the orifice; but this is far from being true. For instance, if a flow of 144 miner's inches be required, the volume obtained would be 3.3, 4.2 or 4.7 cubic feet per second, according as there were 144 holes 1 inch square, one opening 1 inch deep and 144 inches long, or one opening 12 inches square, the tops of all openings being 5 inches below the surface of the water. Weir measurements are more accurate, and could be substituted for the method by orifices.

A DIRECT method of separating platinum from gold or silver or both is to fuse the metals, three parts of zinc by weight to one part of the other metals. The product of the fusion is to be hammered or rolled into a sheet or ribbon and immersed in sulphuric acid, which will dissolve out the zinc and leave a spongy mass ready for digesting with nitric acid of a specific gravity of 1.199 until all the silver is dissolved. After the residue is carefully washed it is further digested in a solution composed of 100 volumes concentrated hydrochloric acid, forty-three volumes concentrated nitric acid and 143 volumes of water. About the third or at most the fourth repetition of this last the gold will have gone into solution, the pure platinum still remaining undissolved. Then separate by filtration, the gold being finally precipitated by sulphate of iron.

IN every country which has a written language and a system of coinage, the abbreviation for the unit of value precedes the figures. In England the pound mark (£) is used in the same manner that the dollar mark is used in this country. In Germany the abbreviation m (for mark) appears preceding the number, just as the French abbreviation fr. (for franc) is used in France. The English pound sign is the oldest monetary abbreviation now in use, is the initial letter by which the Romans expressed "pounds," just as we use the "lbs." Moderns use money's abbreviation backward, because the Romans, in expressing pounds, always said libra decem, instead of decem libra, the first being pounds ten and the latter ten pounds. When their initial letter or character was used it always preceded the figures. Thus the whole world got in the habit of doing these things backward.

TO WATERPROOF blue prints, immerse in melted paraffine until saturated a number of pieces of an absorbent cloth a foot or more square, and when withdrawn and cooled they are ready for use at any time. To apply to a blue print, spread one of the saturated cloths on a smooth surface, place the dry print on it with a second waxed cloth on top, and iron with a moderate flat-iron. The paper immediately absorbs paraffine until saturated and becomes translucent and highly waterproof. The lines of the print are intensified by the process, and there is no shrinking or distortion. As the wax is withdrawn from the cloths, more can be added by melting small pieces directly under the hot iron. By immersing the print in a bath of melted paraffine the process is hastened, but the ironing is necessary to remove the surplus wax from the surface, unless the paper is to

be directly exposed to the weather and not to be handled. The irons can be heated in most offices by gas or over a lamp, and a supply of saturated cloths obviates the necessity of the bath. This process, which was originally applied to blue prints to be carried by the engineer corps in wet mines, is equally applicable to any kind of paper, and is convenient for waterproofing typewritten or other notices to be posted up and exposed to the weather.

CARBONS for arc lights and other carbons for electrical purposes are made from coke, this coke being a by-product of the process of petroleum refining. This material is the solid product or residuum which is left in the refining stills after the oils have been driven off. This material is calcined to free it from volatile matter, and then ground and bolted to further free it from coarse particles. In this condition it is almost pure carbon; before being molded it is mixed with a binding material. Two processes are in use for molding the carbon. In the first they are molded under hydraulic pressure in split molds, eighteen or twenty carbons being molded at once. In the second method the material is forced through dies by means of heavy hydraulic presses, the carbons being molded in 4 or 5-foot lengths, and afterwards cut to the required size. They are then baked in kilns for eight or ten days, and afterwards sorted and tested. In some cases the carbons are also thinly plated with copper by means of special machines.

MOLYBDENITE is the sulphide of the rare element molybdenum. It is not a common mineral, but it is found in small quantities in a good many localities, chiefly in crystalline rocks like gneiss. Like graphite, which it much resembles, it occurs in foliated masses or in crystalline plates having a hexagonal outline, rarely in distinct hexagonal crystals. It is also very soft (H. = 1—1.5) with a soapy feel, and leaves a trace on paper. It has a bluish-black color and metallic luster. The color, however, is distinctly bluer and the specific gravity (G = 4.7) is higher than that of graphite. The composition of molybdenum disulphide, MoS₂, gives: Sulphur, 40; molybdenum, 60 = 100. Heated in the open tube or on charcoal, it gives off strong sulphur fumes and yields a deposit, which is pale yellow or white, of molybdic oxide; this coating on charcoal, if touched with an intermittent blowpipe flame, becomes a bright blue. Molybdenum also occurs in the salts called molybdates, of which lead molybdate, the mineral wulfenite, is the most common.

THE transmission lines of a system like the Bay Counties Power Co. of California, with lines 150 miles long, have a capacity of about 3 microfarads. Operating at 40,000 volts, this will have $\frac{1}{2} \times (3 \times 10^{-6}) (40,000 \times \sqrt{2})^2 = 4800$ watt seconds = 4800 joules = 3500 foot-pounds of energy stored in its energy storing capacity when fully charged. The charging current is 45 amperes at 40,000 volts, 7200 alternations. Therefore the rate of supply of energy to the line from the generator and absorption from the line by the generator is $45 \times 40,000 \times 2 \times \frac{1}{\pi} = 1,150,000$ watt-seconds per second, = 1,150,000 joules per second, = 843,000 foot-pounds per second. The generator supplies current continuously to the line for $\frac{1}{2}$ alternation and then receives it back again for the next half alternation. Therefore the energy delivered or received in a half alternation is the energy stored in the capacity of the line $\frac{45 \times 40,000 \times 2}{\pi \times 60 \times 4} = 4800$ watt-seconds = 4800 joules = 3500 foot-pounds, as before.

ZINC is often used in boilers and hot water tanks to prevent the corrosive action of the water on the metal of which the boiler or tank is composed. The action appears to be an electrical one, the iron being one pole of the battery and the zinc being the other. Under the action of the current of electricity so produced, the water in the boiler is slowly decomposed into its elements—oxygen and hydrogen. The hydrogen is deposited on the iron shell, where it remains. It will not unite with iron to form a new compound, but, if any iron rust is present, it will remove the oxygen from this and deposit the metallic iron on the plates. The oxygen of the water that is decomposed, instead of going to the iron, goes to the zinc, and in the course of time the zinc will be found to be almost entirely converted into oxide. On account of the action outlined, it is generally believed that zinc is always a good thing to prevent corrosion, and that it can not be harmful to the boiler or tank under any circumstances.

TO DETERMINE the amount of coal that it is possible to burn in one hour on each square foot of grate surface, multiply the square root of the height by two and subtract one from the product; the result will be in pounds. With the chimney 144 feet high, the answer is twenty-three pounds. But in ordinary practice it should not be over 60% of that. Taking the twenty-three pounds, however, the maximum quantity, as a basis, where there are 90 square feet of grate surface that would give 2070 pounds per hour as the maximum quantity of coal that can be burned. The area of chimney in square feet is found by dividing the pounds of coal burned per hour by the square root of the height, multiplied by 12. In this case it would be $2070 \div 144 = 14.4$ square feet. The diameter of a round flue that would contain this area is found by dividing by .7854 and extracting the square root of the quotient: $14.4 \div .7854 = 18.5$, the square root of which is 4.3 feet. The horsepower of boilers that may be operated by that chimney can be determined by dividing the coal burned by 5: $2070 \div 5 = 414$ H. P.

Reformed Copper Ores.

NUMBER III.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by J. C. GOODWIN.

On examination for the origin of the reformed ores I find a great iron gossan dike on the contact between the rhyolite and limestone. This now is what is left of a great sulphide dike or vein. If one enters a shaft and is lowered to the 200-foot level, on examining this dike or vein at this depth he will find the dike to be a sulphide dike, in which the iron sulphides carry but a small per cent of copper. He will find the dike to be soft, and this will tell him that something has been removed by water after decomposition; he will find blue streaks running down the sides of the dike. The copper sulphides are breaking up and forming copper sulphates, a soluble salt. Copper sulphides decompose easier than iron sulphides, but in the decomposition of the iron sulphides it forms not only a soluble sulphate, but sulphuric acid. Although iron sulphide is soluble in sulphuric acid, it does not pass to a lower level, along with the copper sulphates, to form ores of iron. The reason is this: The hanging wall of this dike or vein is calcium carbonate, and it is slowly being dissolved by rain water containing carbon dioxide. The calcium carbonate in this water acts upon the sulphuric acid and iron sulphate, forming iron carbonate and calcium sulphate. Calcium sulphate being soluble in water, passes on down and may be carried thousands of feet before being deposited. The sulphuric acid acts upon the calcium carbonate wall also. The copper sulphate being soluble is carried slowly down until it reaches the permanent water level. At this level in the Bisbee mine you will find much of wall rock has been changed by the solutions that originally deposited the sulphides, into calcium and magnesium silicates. The sulphates of these copper salts acting upon these wall rocks replace them with native copper and copper oxides.

Calcium sulphate, magnesium sulphate and siliceous acid go into solution. The siliceous acid is found associated with the copper ores in a hydrated form. Not all of the iron sulphate was precipitated as it was being broken up, but some of it was carried below and deposited in the same manner as the copper salts, forming oxides. You may expect to find similar zones of enrichment in mines that have one wall of an alkaline earth, and you may expect to find this zone at or just below water level, and a gossan dike leading to the sulphides. The reason of this is that the solution that precipitates the metals is an alkaline solution, so in the Bisbee mine you find condition as I have described, but all the conditions under which ore is found in Bisbee are not the same. All of the ore is not found in the contact or in the limestone, but a great body extends eastward many feet into the felsite, a very siliceous rock.

Here we do not expect the reformed ore to be the same kind because conditions are different. In the breaking up of the iron and copper sulphides soluble salts of iron and copper were formed with an acid solution. The solution that leached out and carried down these salts being acid, attacked the iron sulphide and hydrosulphuric acid is given off. The hydrosulphuric acid precipitates the copper sulphate as a sulphide with the formation of sulphuric acid. Thus it is seen that the three processes of disintegration, liberation of sulphuric acid and reformation of the ore as a secondary deposit are continuous, and that the low-grade chalcoprites are broken up and changed into chalcocite, a high-grade ore. Chalcocite is only found where the wall rocks are siliceous and not easily acted upon by the acids.

The solution from which the chalcocite was deposited contained the iron as a soluble sulphate. This sulphate was carried off by this solution and it may have been deposited lower down or have been carried on into the gulch below. As one passes from the partially decomposed sulphides near the 200-foot level down to or near the water level, they pass through the oxides and metallic zone of enrichment which I have described. If one descends to the 800-foot level in the Spray shaft he would find at that depth a great body of sulphides of iron and copper chalcoprites many feet wide. The dike or vein at this depth is undecomposed and as it was originally formed. The ore has for a hanging wall altered manganese and calcium carbonates mixed with manganese calcium silicates. The foot wall is not definitely defined, as the ore insensibly gradates into the rhyolite. For, as you pass from the hanging wall eastwardly through the dike or vein, after quite a number of feet the ore becomes leaner in copper sulphides, and if one was to explore far into the rhyolite dike at this depth they would find it very siliceous and pyritiferous, for every indication goes to show that the whole of this rhyolite dike is pyritiferous, but all surface indications that I have examined lead me to believe that little copper pyrite is associated with the iron pyrite.

There is an indication that is always found where great dikes which contain iron and copper pyrite dis-

integrate. For example, near Glohe, in Gold gulch near the Black Warrior property, are great deposits of sand and gravel cemented together by copper carbonates.

Miners have broken up this conglomerate mass and sorted out the cement copper and shipped it to smelters. If you examine a large hill which rises above this conglomerate mass, you will find it a felsitic porphyry impregnated with copper and iron pyrites. In the disintegration of this hill the iron and copper sulphates were formed and water carrying them down precipitated the copper as a carbonate, the iron being precipitated as a ferric oxide farther down the gulch. One will always find at the base of felsitic porphyry or other pyritiferous rocks great beds of sands and gravel cemented into a conglomerate; if copper is present the whole mass is green, but if no copper is present the mass is cemented together with the red oxide of iron; so on examining one of these concretionary deposits, if no stains of copper are found, you may say with certainty that no copper exists as a pyrite in the surrounding rocks.

By comparison I will give the conditions as nearly as I understand them of some of the great copper producing mines of the West. Let us examine the United Verde mine.

At the surface it is a quartz gangue vein containing some carbonates of copper. Originally this vein contained iron and copper sulphide ores. These ores in decomposing formed an acid solution and the copper reprecipitated as copper sulphide under the conditions that I have described.

There being some alkali earths associated with the vein and country rock, some carbonates and oxides are formed. Nothing is formed by chance, but by some law either by chemical or mechanical action.

I will quote from Arthur W. Wendt's "Copper Ores of the Southwest," in the Transactions of the American Institute of Mining Engineers; in speaking of the United Verde mine, he says: "In fact, here as elsewhere, copper glance appears not to be the true ore at all, but a production of decomposition and of secondary origin derived from leaching of veins above and subsequent concentration at a lower point. The oxidation of pyritous croppings is but a roasting carried out during ages by the combined action of air and moisture." It is true, as Prof. Wendt says, that the veins above were decomposed and the ores concentrated at a lower point, but the reason that the concentrates are in the form of chalcocite instead of an oxide is that the vein matter and country rock are silicates instead of a basic rock.

Another illustration is the Congress gold mine. The vein of this mine below the water level is quartz impregnated with a pyrite of iron carrying gold, and is a fissure vein cutting granite, a siliceous rock. From the surface to the water level the sulphides are oxidized, and cavities alone remain to show where the sulphide once existed. The reason the iron did not remain in the cropping forming the gossan vein is because the iron sulphide in breaking up formed iron sulphate, sulphuric acid and free sulphur. The sulphuric acid attacked the iron sulphide and iron sulphate and hydrosulphuric acid were formed, and the action continued until all of the sulphides of iron were broken up. The solution being acid, the iron sulphate was leached out by water and carried away. Only near the surface of the iron sulphates could any iron be precipitated as a hydroxide or carbonate. The reason is that all surface water contains a little carbon dioxide or organic acid combined with some soluble base, and this may act upon the iron sulphate after the majority of acid has been removed, and neutralized the acidity and formed hydroxides and carbonates of iron. If one of the walls of this vein had been a basic carbonate, instead of being acidic, a gossan vein would have been found instead of a honeycombed quartz vein.

An article in the July number of Mines and Minerals entitled "Secondary Enrichment," by S. F. Emmons and Weed, speaking of the Butte, Montana, region, they say: "It seems as if the copper leached out of the 400 feet of vein depleted near the surface had been concentrated in underlying ore and had thus produced a zone of secondary ore 200 feet deep containing twice its normal copper contents. The original ores of the veins are quartz and pyrite, chalcoprites and enargite. The richer sulphides, hornite, chalcocite and covellite, are of later origin." They say further that "an oxidized upper zone extending down 200 to 400 feet, containing less than 1% of copper, the value being principally silver. It is a mass of crumbled quartz, honeycombed and free from metallic oxides." The question arises as to why the decomposed vein matter left behind a mass of crumbled quartz, honeycombed and free from metallic oxides, while the vein matter in the Bisbee mines are almost entirely of metallic oxides. Prof. S. F. Emmons says that "the formation at Butte, Montana, is indeed strictly granitic, and it is said that no sedimentary rocks are found within 15 miles of Butte." Therefore, the wall rock being very acidic, the condition of the vein to-day is as we would expect the original ore of the vein having quartz, pyrite, chalcoprite and enargite. Air and moisture acting upon the pyrites and chalcoprites easily broke them up into sulphates and free acid. The solution containing

the sulphates and free acids is carried by the percolating water down along the vein.

It did not stop and deposit the minerals in any one zone of enrichment. The conclusion is the acidulated waters containing the sulphates and acids began the work of displacement at or near the 400-foot level and continued downward until the acidity of the solution became neutralized.

In this displacement the silver and copper sulphates displace the iron sulphides, molecule by molecule, the iron sulphate being carried out by the water. So it will be seen the alkalies or alkali earths have had much bearing upon the various ores as they were originally being deposited or as they were re-deposited from decomposition of the original ores.

If the Butte, Montana, mines had contained no silver or lead sulphides, only chalcoprites, there would have been no Butte to-day.

Silver sulphides are solvable with difficulty in waters and acids, lead sulphides being almost insoluble in the same. If they had been as solvable as iron and copper only a quartz vein would have been found above the 400-foot level. The same is partly true of Jerome camp. Old Dominion, at Glohe, was worked for silver to the depth of about 160 feet.

A few days ago I visited Cananea, Mexico. Among the many claims owned by the Green Mining Co. is the Copete, on the surface a great iron gossan vein many feet wide but no indications of copper on the surface, only oxide of iron; 100 feet or more below the apex of the vein was encountered in sinking a great enrichment of oxisulphide of copper.

The same conditions are found in many other of the company's claims, the country rock in this district being of basic porphyry, and there being alkali earths enough at or near the surface to precipitate the iron but not enough to precipitate the copper as oxides or carbonates.

Two great leveling agencies, wind and water, in their eminence work have exposed many mines, and because of this an expression is in the mouth of the typical prospector, "that any fool can find a mine," but the prospector of the future will be the man who has learned all that is known of the condition under which any mineral he may search for may be deposited, and these conditions can only be learned by studying and comparing the mines of the world.

Zinc Smelters and Acids.

Regarding the process of smelting zinc ores and producing sulphuric acid, the process of treatment of zinc ores is briefly as follows: After the sulphur is removed by roasting, the fine ore is placed in clay retorts, which are cylinders of fireclay 4 feet long and 8 inches in diameter, closed at one end. These fit in openings in the walls of the furnace with the open ends flush with the walls, and are arranged in rows forming a block. When coal was used for fuel, 224 retorts were placed in a block, while with gas about 600 can be placed in one block. When charged with ore, a condenser, a conical fireclay vessel about 12 inches long and 6 inches in diameter at the larger end and 2 inches at the smaller end, is so placed that the larger end just enters the open end of the retort.

As the ore mixed with powdered coke is heated, the zinc is driven off as heavy vapor, which forms in drops on the inside of the condenser, from which the metal is tapped in long ladles about three times in twenty-four hours. The molten metal is emptied into a traveling kettle and poured into molds about 9x19x1½ inches, making a 50-pound plate known as spelter.

The zinc works made their own retorts and condensers out of good fireclay mixed with one-third its weight of fragments of old retorts pulverized. The materials are mixed in a pug mill with water and then passed through a molding machine and afterwards dried in a heated room for some weeks. They are finally fired in a small furnace for twelve hours. The condensers are made in hand molds, as needed.

In the new plant of the Standard Acid Co., Iola, Kan., the zinc ore is roasted in mechanical continuous roasters composed of a seven-row muffle kiln capable of roasting sufficient to run a three-block (1800 retorts) smelter. The sulphur fumes pass into a flue where the dust is deposited, and the sulphur gas passes to a square condensing tower 49 feet high, and the heat of the gas is used to concentrate the weaker acid. The gas is then carried through a 3-inch pipe into six chambers connected tandem, 150 feet long, 20 feet high and wide, and in these condensation takes place. Into these chambers exhaust steam is admitted, and the gas passes into two absorbing towers lined with lead and filled with a checker-work of chemically prepared bricks where the nitrogen compounds are recovered. These were added in the condensing tower in the form of nitric acid to furnish oxygen.

In the lead-lined chambers the steam and sulphurous gas unite and form sulphuric acid. From the condensing towers the acid passes through lead coolers kept cool by flow of water, and it is then pumped into storage tanks and run into tank cars of 65,000 pounds capacity. Twenty of these cars are being constructed for this work.

The buildings cover twenty acres of ground. The main building is 526 feet long, 65 feet wide, with an L of 111 feet, and is 70 feet high. The plant will

treat forty-five tons of ore a day, yielding fifty tons of acid. The acid is used in manufacture of fertilizers, refining of petroleum, alum, soda ash, blue vitriol. This is probably the only plant in the United States manufacturing sulphuric acid where natural gas is used as fuel. The sulphur vapors so destructive to the vegetation around the smelters are thus made of economic importance, and, with the exhaust steam, furnish materials which would otherwise go to waste.

Automatic Water Motor.

Herewith is illustrated the Cassel automatic water motor, an impulse water wheel that presents some new features, prominent among which is a novel

rect result of its velocity, the arresting of its velocity destroys its power. Consequently when power is again required a certain lapse of time must transpire from the moment freedom is granted to the flow of water before its maximum velocity is attained, and resultantly its maximum power.

"The water in the pipe line of a hydraulic plant will weigh many tons—often hundreds of tons—when the nozzle at the end of the pipe line, where the water is delivered to the wheel, is wide open, these hundreds of tons of water will be flowing at a rate of speed necessary to deliver the water which the nozzle will discharge. Now, if the nozzle or valve admitting water to the water wheel be suddenly partially closed, the pressure of the water at that point will greatly increase until the tons of water in the

without in the least degree interfering with the free flow and velocity of the water and its consequent power."

The subject is an interesting one to all hydraulic engineers. The system is controlled by the European Co. at 56 Broad St., London, E. C., England, and at the Dexter-Horton Building, Seattle, Wash.

Diamond Drilling at Rossland, B. C.

Diamond drill outfits at Rossland, B. C., are constantly kept at work exposing the deposit. Two sizes of drills are used, one with a bit of 2½ inches outside and 1½ inch inside diameter, and the other with 1½ inch outside and ¾ inch inside diameter. In

starting the drill, especially from those drifts in which tramming is being pursued, a short crosscut is first made by the percussion drills to give a space for the machine and the proper handling of the rods. The rods are square threaded at the ends and come in 5-foot lengths. They are pulled in lengths of 5 to 20 feet, according to the space available behind the drill.

The holes are cored throughout. The core barrel is 5 feet long, and the frequent slips and small seams in the country rock permit the cores procured to be easily broken off by the usual choker device. The average length of the pieces of core is 5 to 8 inches. In careful sampling the core barrel is sometimes pulled out for every 6 inches advanced. The drilling engines are screw fed, and fitted for 300, 700, and 1000 revolutions per inch of advance. Their ordinary speed is 300 revolutions per minute. The water is pumped through the drill rod by a small independent pump run by compressed air. The average progress is 8 feet in an eight-hour shift, with a record of 18 feet 9 inches. The core is broken up and assayed, after a careful examination by the mine superintendent. While drilling in ore, sludge samples are taken by running the discharged water for a fraction of the time into a tin pail, in which the sludge settles out.

The Rossland rock is very hard on diamonds. The War Eagle and Center Star companies employ a skilled bit setter to keep the bits in running order. For the smaller sized bits eight diamonds are used, six on the face and two on the outside. Those on the face are set so that half of them have a cutting edge extending to the outside of the face, while the other half cut the inside clearance for the core to pass up. Whenever the drill is withdrawn from the hole the bit is always carefully examined, and if any of the diamonds are found to be loose or the metal worn away, the metal is recalled around them. When the bit is so badly worn that the diamonds are greatly exposed, they are cut out and reset in a new metal blank.

The wear of carbons is somewhat less than ¼ karat per foot of hole drilled. Each bit will only drill about 12 feet before resetting. To remove a bit that has been broken off in the hole, it is sometimes necessary, if other devices fail, to ream out the whole with a new bit, large enough to enclose the stuck bit and recover it in the core barrel.

United States Mineral Products, 1901.

The United States Geological Survey has issued its annual statistical summary of the mineral products of the United States for the calendar year 1901. It shows for the entire country a total of \$1,092,224,380 as the value of minerals produced in 1901, as against \$1,064,408,321 in 1900. This comprises \$566,351,095 worth of non-metallic mineral products, \$524,873,284 metallic products and \$1,000,000 (estimated) of mineral products unspecified, including building and glass sand, iron ore used as flux in lead smelting, tin ore, nitrate of soda, carbonate of soda, sulphate of soda and alumina clays used by paper manufacturers.

Following is the value of some of the various products: Pig iron, \$292,174,000; silver, \$77,126,382; gold, \$80,218,800; copper, \$86,629,266; lead, \$23,230,200; zinc, \$11,265,760; quicksilver, \$1,382,305; aluminum, \$2,238,000; antimony, \$542,020; bituminous coal, \$236,201,899; Pennsylvania anthracite, \$112,504,045; natural gas, \$27,067,500; petroleum, \$66,417,335; brick clay, \$13,800,000; cement, \$15,788,789; stone, \$55,165,576; grindstones, \$580,730; borax, \$1,102,110; phosphate rocks, \$5,316,403; pyrites, \$1,024,449; salt, \$6,617,449; zinc white, \$3,110,120; asphaltum, \$555,335; clay, all other than brick, \$2,591,332; limestone for iron flux, \$4,665,836; mineral waters, \$7,588,962.

Fig. 1—The Cassel Self-Governing Water Wheels for Large Powers.

method of speed regulation. The governing of the wheel is given prime attention. The manufacturers argue in this way:

"As water is practically non-elastic, water power

pipe line have been slowed down to a rate of flow equal to what will pass through the reduced valve. As a consequence, nearly as much water will pass through the reduced valve temporarily on account of

Fig. 2—The Cassel Self-Governing Water Motor—Phantom View.

is the result of the velocity of flowing water. Steam power is the force or energy as a consequence of the compression of steam—a most elastic fluid. The governing of steam engines resolves into the simple principle of controlling the supply of steam to the steam cylinder. The automatic mechanism governing the supply is based upon the principle of centrifugal force. The non-elasticity of water forbids its flow being controlled in the manner of stopping the supply as with steam. And since its power is a di-

rectly the increasing pressure as before, causing at the same time a tremendous strain upon the pipe line. From this it will be seen that, although the water wheel governor may have closed the valve at the proper time, by so doing it has not performed all of the necessary act of governing. The principle employed in the Cassel automatic water wheel is that of centrifugal force as the basis of the automatic mechanism, acting in moving the buckets of the wheel out of the line of impact of the jet or flow of water,

Things to Which Miners Are Liable.

The miner's work is peculiarly dangerous. Neither his surroundings nor his manner of doing his work are conducive to health. This article, however, has nothing to do with the miner's many injuries caused by falling rock and accidental explosions, but more particularly with the pathological changes found in examining men who for years have followed mining continually. We may for convenience divide these diseases into acute and chronic.

Powder smoke headache is the most frequent acute trouble. Where giant powder is used the patient presents all the symptoms of cerebral congestion. The eyes are watery and bloodshot, pupils contracted. The patient has flashes of light before his eyes, intense headache, restless, twitching muscles, frequent nausea and vomiting, possibly due to stimulation of the vomiting center in the medulla oblongata. The face is pale, the pulse rate and wave are both increased. The first few whiffs of powder smoke may make the face congested, but this soon passes away. Every beat of the heart causes a throbbing pain in the head and humming in the ears. Sometimes the patient staggers like a drunken man, and I have known a mine foreman to discharge one of his men whom he saw staggering and reeling on his way to the bunkhouse. Men get accustomed to powder smoke, just as patients get used to taking nitro-glycerine, and the dose must be increased in order to get the desired effect. So in powder smoke, if the miner is in the smoke more than usual he gets the headache, as when he first began mining. Handling giant powder will also cause a headache. It will act as a severe local irritant poison, especially about the eyes, giving rise to severe conjunctivitis and oedema. A combination of acetanilide, citrated caffeine, soda bromide and gelsemium will quickly relieve this distressing headache. I prefer the powdered medicine to the tablets, because of its quicker action.

Sabina is another acute trouble of which I have seen a few cases. All were miners working in a very hot mine; all were new men. The sweat glands seemed to secrete more sweat than the ducts could carry off. Small histers formed, with no inflammation and but little itching. The skin was rough, with a pebble-like feeling. The men changed work, no medicines were given, the blebs dried up and sealed off.

The chronic troubles are more serious. Chronic laryngitis is possibly the most frequent. In my opinion it is largely caused by the peculiar manner of expelling air from the lungs. With nearly every stroke of the hammer the miner expels the air with a rasping noise, which irritates the vocal membranes. Nearly all miners while drilling are mouth breathers. Sometimes the air is cold and dust-laden, which increases the trouble. It will last as long as the cause exists. Medicines are palliative but not curative.

Chronic bronchitis is another frequent trouble of the miner. His work tends to produce it. Where compressed air is used in drilling the air is extremely cold. His habit of mouth breathing, sudden changes from a warm drift to a cold shaft, the sudden falling or rising of blood pressure caused by rapid changes in atmospheric pressure, breathing dust and smoke-laden air, all tend to produce a chronic catarrhal condition of the bronchi, with morning cough and free expectoration of mucous streaked with pus. This condition is not so dangerous in itself, frequently clearing up nicely by simple rest and outdoor life, aided by a little medicine. Yet the man who has an inflamed area in his bronchi is always in danger, because that mucous membrane of lowered vitality is a suitable nidus for tubercle bacilli to lodge and grow. Perhaps this condition can be prevented by teaching the men how to breathe, remembering that God breathed into man's nostrils and not into his mouth.

Miner's consumption is but a step along the same line. I have nothing new to add to this, unless the statement that the lungs take on the color of the material in which the man is working. The lungs of the old coal miner are as black as a lump of coal. The lungs of the hard rock miner are usually grey, especially about the edge, frequently imparting to the touch a gritty, sandy feeling.

I wish to call attention to a peculiar condition of the eyes that I have noticed in old miners and also in blacksmiths, a trembling, twitching, restless, constantly moving condition of the eyeballs, a snappy movement of the eyelids. I have noticed this in hundreds of miners and several blacksmiths. It does not seem to interfere with vision, so far as I know. In the miner I think it is caused by the flickering candle light. In the blacksmith it is possibly caused by the forge fire.

Most of the miners work on Sunday. Men have come to me for treatment who have worked over 1000 shifts without missing a day, sometimes doing over time. These men are simply worn out. Some trifling ailment and the man either dies or is dangerously ill. His vitality exhausted, his surplus energy used up, he has no recuperative power. The Almighty worked six days and rested on the seventh. When He made man He did not endow him with power and

endurance greater than God. The remedy is self-evident.

For some months I have been conducting a series of examinations and urinary tests in order to detect chronic mineral poisoning in miners and smelter men. At present I can only say that I have undoubted evidence of general systematic poisonings by antimony, arsenic, copper and lead. At some future time, when the accumulating evidence is more complete, I will make a report.

In my opinion it is our duty as physicians not only to endeavor to cure our patients, but to prevent their getting sick. Teach them, then, how to live and how to breathe, and much of the sickness is prevented.—Dr. J. W. Coleman in Colonial Medical Journal.

Gold in a New Role.

TO THE EDITOR:—I have made a discovery in the metallurgy of gold which I believe is of importance. The principal feature is shown in an experiment made purposely to give data for this article.

In a conical pit in a piece of charcoal was placed 35 mg. of "exude"; on that 10 mg. of gold; then placed before the blowpipe flame and gradually heated. When the gold softened the exude showed points of white metal; as the gold fused this white metal was absorbed, the gold, apparently, acting both as reducer and flux without slag or residue; the bead thus obtained—purple in color—weighed 45 mg.; after cupelling to a finish—no longer staining the cupel—it was purple in color and weighed 40 mg.; it was then moved to a kaolin cupel, where the cupelling action went on freely, until a bright gold bead was obtained. This gold bead weighed 35 mg., more than three times the weight of the gold added to the exude.

What is this exude? this light weight, greenish-gray colored, pulverulent mass that is reducible to a metal without loss of weight, having no appearance of gold, to which gold acts as both flux and reducer without slag whereby the weight of the gold is increased over three times?

I do not know what it is, and have given it, for the present, the name of "exude," on account of its method of isolation from its origin, which first brought it to my attention some years ago, when, not knowing its auriferous value I threw it away as refuse.

The matter was recently brought to my attention again on the finding of a pocket of gold ore in J. W. Opp's mining property, which joins my gold mining claim. In a specimen of this ore I saw a metal resembling sylvanite; some of the gold had a greenish hue, which I considered indicative of the presence of this exude. An assay in the usual way gave a dark bead; I took this bead, heated it to fusion on a new cupel under the blowpipe flame, and then gradually lowered the heat. At fusion the bead was clean and bright; as it cooled it dulled; a skin formed on the outside, the metal on the inside remaining for some time fluid. At a critical period exuded a pulverulent mass, at first red, then brown, finally when cold a greenish gray. Repeating the fusion and cooling until no more "exude" formed, removing each crop of "exude," there was finally a bead of bright gold obtained. What is this "exude" that appears to come from gold and return to gold?

On charcoal, before the blowpipe flame, the powdered "exude" is reduced to metal without slag; particles in contact at the instant of fusion run together forming a bead; particles not in contact with others form isolated minute beads, and only with much difficulty can they be made to join each other, acting like globules of sickened mercury. A closer examination shows that a skin forms on each bead just after fusion.

These minute beads are brilliantly colored—blue, scarlet, purple and green—purple predominating.

By putting these beads, or the "exude," in a conical pit in charcoal, and beating to fusion and stirring, the "exude" can be brought into one bead of metal, generally violet in color. Scratching the surface shows the metal to be white. This metal I call "exude" for the present, as all of the phenomena above stated can be obtained with it, when all the conditions are right; a slight variation in conditions may result in wide variations in results. There are many variations which would take too much space to describe here, but I am of the opinion that this "exude" is the cause of some of the disputed statements occasionally made about variations in assays, losses on cupels, no gold by one report, good returns by another on the same ore, and there is here, apparently, indicated the possibility of truth in some statements, that by some new process two or three times the quantity of gold is obtained from certain ores than by the usual methods. If an ore contains a large quantity of some form of this "exude" the above experimental results accord with such claims and make them reasonable. I have only met with it in very small quantities so far, but the fact of the existence of a metal associated with gold, having the properties I think I have found this "exude" to have, is important to know, making the examination of some alleged new processes reasonable procedure. Jacksonville, Or.

JOSEPH VOYLE.

Smelting Charges.

TO THE EDITOR:—I have read with much interest, and some astonishment, the articles on "Smelting Charges" in your issues of June 21st and 28th.

I am astonished that any customs smelter should find it necessary to charge its patrons 4½ cents per pound for shipping, converting, refining and selling the copper contained in ore purchased.

Such a proposition shows that this particular smelting company is certainly in business for profit, and if it does not succeed the failure will certainly be due to other causes than a too liberal policy in the purchase of ores.

To show what margin for profit this charge would give to the smelter it is only necessary to state that for years past the smelters at El Paso, Texas, and Silver City, N. M., have contracted with shippers of copper ores to pay for copper concentrates determined by the dry assay, the New York quotations for copper less 2½ cents per pound, and to smelt such ores on a neutral basis for \$4.70 per ton, adding 8 cents per unit for all silica and alumina in excess of iron, lime and copper, and deducting 10 cents per unit for excess of iron over silica and alumina.

The El Paso smelter is still carrying out contracts on above terms. The Silver City smelter is not now in commission, but its closing down was only due to the fact that the enlargement of the El Paso plant made that smelter able to handle all the ores available for both smelters, and to do the work more economically than was possible in the smaller smelter at Silver City. Both smelters being operated by the American Smelting & Refining Co., that corporation very properly closed down the one which was, for the present at least, superfluous.

I make a comparison showing prices that would be paid for the copper concentrates of samples No. 3 and No. 4 mentioned in your issue of June 28th by the El Paso Smelting Co. and the Rocky Mountain Smelter, whose rates you have quoted, as follows, assuming that each sample contains 50% excess of silica.

Sample No 3 at El Paso prices:
Copper 22%—less 1½%—20½%, or 414 pounds copper per ton at 11½ cents, N. Y. quotations, less 2½ cents, 9 cents per pound.....\$37.26
Smelting charges \$4.70 + \$4 for excess silica..... 8.70

Net price realized for copper in one ton ore...\$28.56

Sample No. 3 at Rocky Mountain Smelter prices:
Copper 22%—less 1½%—20½%, or 414 pounds copper at 11½ cents, N. Y. quotations, less 4½ cents, 7 cents per pound.....\$28.98
Smelting charges \$6 + \$5 for silica..... 11.00

Net price realized for copper in one ton of ore...\$17.98

Difference in favor of El Paso per ton of ore.....\$10.58

Sample No. 4 at El Paso rates:
Copper 12%—less 1½%—10½%, or 214 pounds copper at 11½ cents, N. Y. quotations, less 2½ cents, 9 cents per pound.....\$19.26
Smelting charges..... 8.70

Net price realized for copper in one ton of ore...\$10.56

Sample No. 3 at Rocky Mountain Smelter rates:
Copper 12%—less 1½%—10½%, or 214 pounds copper at 11½ cents, N. Y. quotations, less 4½ cents, 7 cents per pound.....\$14.98
Smelting charges per ton..... 11.00

Net price realized per ton of ore.....\$ 3.98

Difference in favor of El Paso \$6.58 per ton of ore.

Comment is unnecessary, unless one should say that "Comparisons are odious."

It cannot be objected that El Paso is more favorably situated for economical smelting. On the contrary all Rocky mountain smelters, which as I take it means all Colorado smelters, are nearer the Eastern seaboard, nearer to coal fields, and have cheaper railroad freights to the East on matte, cheaper machinery and cheaper coke and fuel than El Paso.

The El Paso plant is operated by the American Smelting & Refining Co. and is "in business for profit," and does not fail to make profit all the time.

It is possible that this Rocky mountain smelter desires to discourage the mining for copper, reduce the chances for the profitable opening up of more copper mines, and, as far as can be done by a prohibitive smelting charge, to limit the output of copper in the West.

Or perhaps this smelting company has patterned after the illustrious example of that extraordinary financial prodigy, with whose fame the whole world is just now ringing, and has been so liberal in "commissions" and so altitudinous in its capitalization that extortion becomes a necessity in order to pay dividends on watered stock.

As Mark Twain recently said: "This is the American policy, the policy of give and take, give one and take ten."

C. P. CRAWFORD.

Silver City, N. M., July 31.

Value of Ores in Mexico.

In the United States the value of gold and silver ores is everywhere reckoned in ounces troy of the metal "short ton" (2000 pounds avoirdupois) of the ore. In the case of silver, which fluctuates in market value, the New York quotation on a given day must be known in order to determine the gross value of an ore at that date. In Mexico the assay is reported in kilograms of silver or grams of gold per metric ton (1000 kilograms), being 0.1% and 1 gram of gold per metric ton, 0.0001%. The figure is simple and convenient for both assayer and miner. The Mexican buyer purchases at an unvarying price for silver, payable in silver and at a fixed price for gold, payable in gold if the seller insists, but preferably in silver at the ruling rate of exchange between United States gold coin and Mexican silver coin. The price of silver is \$40.915 per kilogram in Mexican silver dollars. That of gold is \$672.416 per kilogram in gold coin. The mints do not, as a rule, issue gold dollars, as the Government keeps it to pay the interest on the national debt. Almost all bullion containing a considerable percentage of gold is shipped to foreign countries (principally the United States) to be refined.

The Mexican mint receives for refining and coining no bullion which does not at least fine 0.900 in gold and silver. For the fine silver, it pays \$40.915 Mexican per kilogram, less 2% coinage charge and the 3% stamp tax. For assaying each bar, not more than thirty-one kilograms in weight, \$2.50 Mexican is charged, and for separating gold from silver, 0.75 per kilogram of bullion. Gold (if over 3-1000ths is

total, 2.6% on \$40.915, is a direct tax on the silver in the ore of \$1.0638 per kilogram or, 1 kilogram being 31.15 ounces troy, about 3.3 cents per ounce.

If the ore is smelted in Mexico, the smelter pays the tax; if it is exported, it must be accompanied with a consular invoice, and sampled and assayed at the horder for the Mexican Government. In that case the mintage tax, that is, the charge which would have been made if the bullion had been sent to the Mexican mint, is also collected. For bullion, matte or other metallurgical product, the tax of 5% is collected upon the full assay value of the metal contained. For ores it is collected upon 90%, and is therefore 4.5% of the assay value.

Finally, if ore is sold to any purchaser in Mexico, there must be a bill of sale, or factura, on which are revenue stamps to the amount of 3 cents for every \$5 or fraction thereof.

Profits, estimated in Mexican money, from silver ores, if they can be treated locally, at expense chiefly payable in Mexican money, are affected only by the amount of imported supplies required for their treatment. If they go to smelters which make their charges in United States money, the returns will depend on the price of silver and the rate of charge.

As a general conclusion, it may be said that, by reason of the peculiar conditions, the mines of Mexico are less dependent upon the market price of silver than those of the United States.

In Gilpin County, Colorado.

Herewith is a half-tone that has a familiar look to many residents of the "Kingdom of Gilpin." It

Cook Mine and Vicinity, "Bobtail Hill," Gilpin Co., Colo.

present) is paid for at \$672.416 gold per kilogram; but payment is made in silver dollars at about ten points below the current quotation of exchange. Finally, the State tax about to be mentioned is collected upon bullion, unless it has been previously paid on the ore.

Government charges practically unknown in the United States are the taxes on ores of silver or gold, paid both to the Federal and to the State governments throughout the Republic of Mexico. These taxes (being laid upon gross product, without reference to profit) are likely to be so severe that in many parts of the Republic it has been the custom not to insist upon the payment of the full State tax. The Federal tax, however, known as the mintage tax, is collected upon all the gold and silver produced in the country—either at the mints upon the bullion presented for coinage, or at the points of export upon ores or bullion shipped to other countries.

The State "extraction tax" is levied on ounces mined and supposed to be collected before they leave the mine yard on packs. This has been for many evident reasons impracticable and it has come to be the custom to collect the tax as the ores leave the mining camp, or, if they are treated in the camp, as soon as the product is shipped away. The Government may accept the sampling and assays of the owners; or an official may be sent to superintend the sampling, and take a special sample for Government assay. The manifest of the shipper states the number of metric tons shipped and of kilograms of silver per ton. The calculator calculates the silver value of the shipment \$40.915 per kilogram of silver, and collects 2% of that value for the State, and also, according to the Federal statute, 30% of the State tax, or 0.6% of the value, as the Federal tax. The

represents the Americus shaft, the Fisk, the office and shafthouse of the Cook mine and the railroad track meandering "Bobtail Hill."

Substitute for Platinum.

The piece of platinum foil which forms part of the outfit of every beginner in chemistry, and of most working chemists, has become so expensive of late that acceptable substitutes are worth considering. Very pure silver is actually superior to platinum for most of the uses to which such pieces of foil are usually put. It must be very pure; the thick sheets used as anodes by electroplaters are pure enough and of a convenient thickness; or any chemist can easily purify his silver and then get a jeweler to melt and roll it.

When used for evaporating solutions to dryness, the silver is liable to be attacked by oxidizing acids, but this action can be prevented by the addition of ammonia, which is generally unobjectionable. For fusions, however, the silver is altogether preferable. Being unaffected by alkalis, it can be used with caustic soda, instead of the carbonate, and thus a lower temperature suffices; manganese and chromium fusions are readily performed. The silver is so cheap—a piece an inch square and a sixteenth thick should cost about 20 cents—that thicker, and, hence, stronger and more durable pieces can be used; with such heavy pieces a strip an eighth of an inch wide may be cut so as to project as a handle, and the assay is thus freed from liability of contamination by material from the tweezers which hold the foil in the flame—generally a great nuisance with platinum.

The platinum wires, also, which are used to hold

salts in a flame for spectroscopy work, may be replaced by iron, with advantage, for the iron may readily be thrown away if they get mixed or incrustated. —W. P. White, University of Wisconsin.

Power Drills.

The power drill consists of the following parts: Cylinder, piston, rotating mechanism, and valve. These constitute the working parts of the drill, and are mounted in a frame or shell, provided with means for feeding it ahead as the drilling progresses.

For work on the surface, the drill is usually supported on a tripod, which is placed over the spot where the hole is to be drilled, and when the desired depth is reached the whole apparatus is moved to the next place, usually a few feet distant. For underground work, such as shaft sinking or drifting, a column or har is used, as several holes can be drilled from the same position of the har, and a tripod is difficult to handle underground where the room is confined. The drill is fastened to the mounting or support in such a way that nearly all the space can be reached and the holes drilled in any desired direction.

In the end of the piston that extends outside the cylinder provision is made for fastening a drill steel or bit, which must be changed for an average size drill, say every 2 feet in depth, which is the extent of the feed, or oftener, according to the time it takes to wear off the cutting edges on the drill steel.

The work of a power drill consists in the piston travelling forward and backward in the cylinder, actuated by the pressure from steam or air, according to what is available. The number of double strokes or blows will vary between 250 to 500 per minute. The forward stroke against the rack is uncushioned, that is, the drill steel fastened in the piston must take the full force of the blow, but the force of the backward stroke is taken up in a cushion by admitting the pressure into the back end of the cylinder before the backward stroke is completed. The work of the piston is controlled by the valve mechanism, which alternately admits the pressure at the top and exhausts it at the bottom.

In this valve mechanism, or the means for controlling the forward and backward strokes of the piston, is the greatest difference in the various types of power drills.

An important feature of the power drills is the rotating of the piston during the work. If the position of the drill steel remained the same during a number of blows, the consequence would be that the steel would wedge fast in a very short time, the hole would not be round but the shape of the bit, and power wasted. It is therefore necessary to rotate the bit a small part of the circle between each blow. This is accomplished by horing out the hack end of the piston to give room for a rifle har, which is part of the rotating mechanism. The usual thing is to place a ratchet ring in the hack end of the cylinder, supported between washers, the one on the inside having a hole in the center for the rifle bar to pass through. In the inside circumference of this ratchet ring are a number of teeth or ratchets. The head of the rifle bar contains two or more pawls that will engage the teeth or ratchet in the ring, when the rifle bar is turned in one direction. Each rifle on the bar is a screw-thread that will make a revolution in about 60" and

the har contains, usually, five or more rifles. In the end of the piston is placed a nut that fits the rifles in the har. This mechanism is so arranged that on the forward stroke the pawls will pass over the ratchets, and allow the rifle har to turn, but on the backward stroke the pawls will hold the rifle bar fast and the piston will turn a small part of a circle. As the stroke of an average size drill is about 6½", the piston will describe a revolution in about nine strokes, so that the force of the blow is fairly well distributed over the bottom of the hole.

The amount of work done by a power drill is usually measured in lineal feet of hole drilled in a given time. This again depends on the kind of rock, the depth to which the holes are drilled, troubles that may be caused from seamy rock, when it is difficult to keep the hole straight, and the drill runner. Comparison is, therefore, difficult if not impossible. In some cases 20 lineal feet drilled in eight hours would be considered good work, in other cases from three to four times this amount would only be considered fair.

The drill runner is a very important factor in the amount of work that can be done with a power drill, for experience counts here as well as in most other things, but, as stated, the condition of the rock and work has a large influence. From twenty to eighty lineal feet may be drilled in a day. Sometimes this is exceeded, as proved by one instance where one man and a helper drilled 218 feet in a little over nine hours. This was done with a 3½-inch drill mounted on tripod and in an open cut.

THE experiment of the Edison Co. upon the black sands of New Mexico in the effort to save the gold therein contained by the application of electricity is reported temporarily abandoned.

Restraining Barriers in Yuba River, Cal.

In 1893 California appropriated \$250,000 to build restraining barriers against further advancement of debris in the Sacramento valley, contingent upon the Federal appropriation of a like amount. This was secured in 1896. In 1901 a further joint appropriation of \$300,000 was secured, thus making \$800,000 available for the work. The whole thing is under the direction of the members of the U. S. engineer corps that constitute the California Debris Commission.

Since the first half-million-dollar appropriation was made, there has been considerable preliminary prospecting, calculating, selecting, boring and estimating. The Commission reached the conclusion that a site locally known as the Narrows, in the vicinity of Smartsville, Yuba county, Cal., would be a suitable one for the proposed work; an extended series of investigations and surveys were then made under the direction of Assistant Engineer Hubert Vischer, determining the depth of the tailings in the bed of the river, the configuration and character of the bed-rock, and, in general, all the existing conditions. The engravings, Figs. 1, 2 and 3, show the nature of the work. Fig. 3 shows a special device made for that work; in boring there-with pebbles 3 inches in circumference were brought up from a depth of 80 feet by the suction process of the boring machine. The test borings showed a depth of from 50 to 85 feet of gravel.

This preliminary work was completed in September, 1898, and about that time it became the settled opinion of the engineers that a further and larger project on much more extensive lines would be required to make the matter have the largest measure of ultimate success. In the work of securing appropriations, etc., the California State Miners' Association was an active factor, and when the decision of the engineers was made regarding the extension of the original plan that organization gave material aid. Obstacles of various kinds arose. The gentlemen comprising the California Debris Commission have more than enough to do, with river and harbor work entirely outside of their additional duties as members of that Commission, and those duties so delegated to them are just that much additional work imposed upon them by the Federal Government without additional pay. Despite this, the members of the Commission have pushed ahead as fast as circumstances would allow, and while the nine years' delay has been exceedingly vexatious, it is not easy to see where the California Debris Commission could have ex-

pedited matters. During the last year much of the delay has been due to the difficulty in securing satisfactory title to the 2000 acres that the Commission decided was necessary. At the 1901 meeting of the California Miners' Association some prompt and characteristic action accelerated progress, and matters have now so far progressed as to make it possible that the actual work so long delayed may be begun this year.

The California Debris Commission thinks that the actual work may be started Oct. 15. Specifications have been forwarded to Washington for the construction of the first of the series of dams to be made, the cost of which will be \$35,000, this to be situated at a point about midway between Brown's Valley and Smartsville, 16 miles east from Marysville. Other dams will be constructed from time to time as the Government deems best. The appropriations, aggregating \$800,000, are expected to provide for the storage of mining debris within the bed of the Yuba river by a system of works designed to separate the coarse material from the fine, and also to provide for narrower and well defined limits in order to preserve in place the extensive deposits in the river below. The scheme, as reported by Hubert Vischer, is to erect several barriers across the river bed, the upper ones to be located about 3 miles east from the mouth of Dry creek; another to be located just below the mouth of Dry creek as a flood overflow barrier; another to be placed at Daguerre Point; also to form a settling basin about 3 miles in length and half a mile in width on the south side of the river. This settling basin will consist of a levee, protected from the wash, to be built in the bed of the river, with its upper and lower ends connecting with the existing levee and shore on the south bank. The end walls are to have inlet and outlet weirs and conduits to regulate the inflow and outflow of the river and to cause the finer material carried in suspension to be deposited and held in the settling basin, through which, at all but flood stages, the river will be compelled to flow. Below the settling basin the river will be confined within well defined lines by necessary training works. The Yuba river was selected as the starting place for the work for the reason that a much larger share of detritus from the mines had been carried down that stream than all the other tributaries of the Sacramento river.

To give a general idea of the project is here presented an illustration of the proposed "Barrier No. 1," from the official drawings and accepted plan as approved by the chief of engineers U. S. army.

The upper barrier will have a height of 40 feet above the present bed, and will extend entirely across the river. Its crest length will be 1000 feet. This barrier is to consist of gravel, cobbles, brush, rock paving and some masonry

Fig. 1—River Bed and Embankment 300 Feet High, Site of Restraining Barrier, Yuba River, Cal.

Fig. 2.—The Narrows, Yuba River, Cal., Where Assistant Engineer Vischer Took Soundings.

in its lower slope; a masonry crest, and a double row of sheet piling in its toe. It is to be built up gradually, the river flowing over it, and its chief function will be to impound coarse material behind it and form a new grade for the tailings, extending up to and beyond the Narrows.

Barrier No. 1 (see engraving) is to be located about $\frac{1}{2}$ mile below barrier No. 2. Its general construction resembles that proposed for No. 2, its height to be 18 to 26 feet above the tailings now in the river, the crest length proposed to be 1100 feet. At its northerly end a by-pass, with a weir 600 feet in length, which in extreme flood stages (assumed at 125,000 cubic feet per second) would permit a flow over the lip of the weir 7 feet in depth, with a flow over the dam estimated at $3\frac{1}{2}$ feet. Barrier No. 1 makes a water cushion for barrier No. 2. At all but flood stages of the river the flow will be through the by-pass or

weir. Both barriers together may raise the plane of river deposits about 40 feet, and are estimated to store, on an assumed gradient of 15 feet per mile, a volume representing 36,000,000 cubic yards of coarse material, at a cost of about $\frac{1}{10}$ cent per cubic yard.

The next structure, a flood overflow barrier, is to be located $\frac{1}{2}$ mile below Dry creek, a composite structure, consisting of some crib work, with rock filling and paving, and some sheet piling. It is a low structure, 4000 feet in length. During floods it will be submerged; at other stages of the river it will direct all the water into or through the settling basin. The next barrier is to abut against Daguerre Point, extending south to the levee or embankment of the settling basin. Its crest length will be 3000 feet and its general height 14 feet. A cut is made through Daguerre Point to rectify the flow and to share with the northerly half of the

SECTION DRAWN TO SCALE (FROM OFFICIAL MAP), OF PROPOSED BAR

Fig. 3.—Apparatus Used in Making Soundings by Boring and Suction Progress, The Narrows, Yuba River, Cal.

harrier the duty of passing the flood waters. This barrier is to be essentially a brush and gravel structure, heavily protected with rock. The flood overflow harrier directs the ordinary flow of the river into the settling basin through inlets in the embankment forming the upper end of the basin. The hasin, as designed, is capable of holding about 14,000,000 cubic yards of fine sediment, and by extending it farther to the westward it can be enlarged to a capacity of at least 50,000,000 cubic yards additional. The project, as here outlined, is estimated to cost about \$780,000, exclusive of the land required (about \$20,000 more).

The project as submitted is novel, since nothing of the kind, so far as known, has ever been attempted, and it is to a certain extent experimental. The various structures are simple and are believed to be safe, practicable, and

reasonably permanent. They can be repaired if required, and if abandoned, not maintained, or never completed, cannot leave the river in any worse shape than at present. If constructed, it is believed that they are capable of storing the debris now in the Yuha river and its tributaries, which is far in excess of that in all the other tributaries of the Sacramento river. The result of the storage cannot be otherwise than beneficial to the navigation and commercial interests of the Sacramento and Feather rivers. The Commission say: "Especial attention is invited to the fact that the object sought to be accomplished is the storage of the detritus now in the Yuha and its trihu-

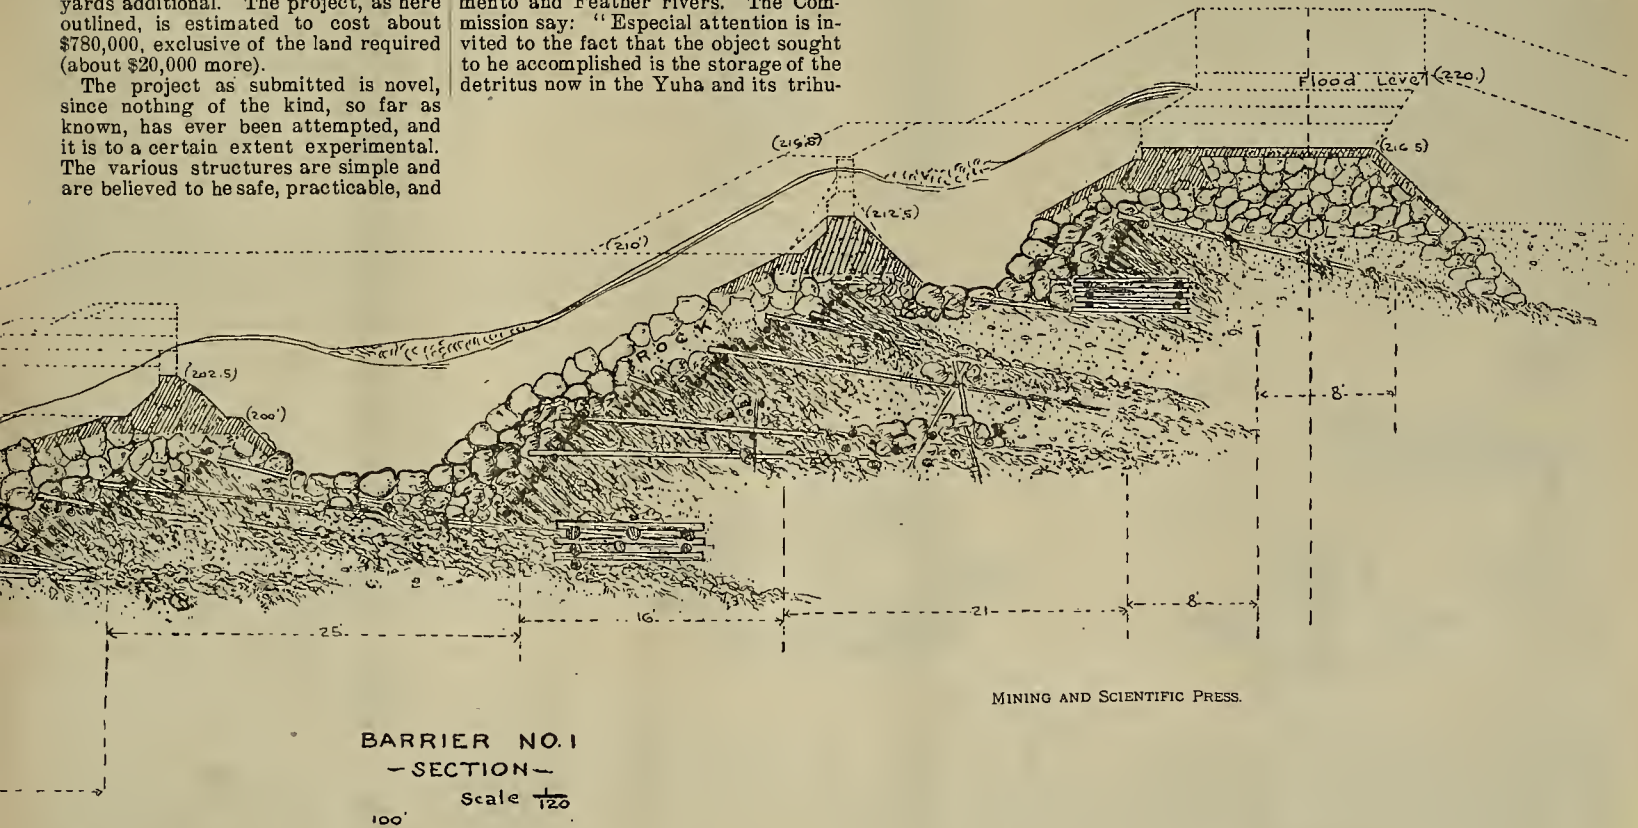

taries, with a view to the improvement of the rivers below, and decidedly not with a view of permitting unlicensed or indiscriminate hydraulic mining at localities above the impounding works. When the works have been completed and in operation for several years there will be time and opportunity to determine whether or not the system is capable of sufficient expansion to warrant an attempt at storing therein the tailings from the hydraulic mines without compelling each mine to impound any or all of its debris."

In the concluding part of his report Mr. Vischer says: "Only a general scheme of operations can be mapped out for such work in advance, a detailed estimate being, of course, out of the question. The work would resolve itself into a multitude of small works, some of them too trifling to require any plans, and would be of the character best covered by the daily labor of an intelligently directed work force, but not necessarily one kept always organized. The operations would consist in clearing lines of brush to facilitate flow, in blocking side channels gradually to obstruct it, in building brush work for spurs to direct current, or for silt arresters to build up land, the work wherever possible to be disposed at the training walls or near by, but not following any prescribed line. The lines of training wall, so called, would actually be property lines, inside of which liberty should exist to conduct work with perfect freedom. There might be some dredging or snagging to remove obstacles in the path of flow, but seeing that the drainage from the settling hasin is intended to follow a southerly route, operations during the dry season of the year would not be interfered with by water. The outcome, perhaps attainable at the end of several years, would be a well-defined river channel of good capacity, bordered by lands which would overflow and form part of the river during flood, and hack of these there would be private lands in process of reclamation, but perhaps still subject to periodical inundation. In brief, the idea is to cause the river to make deposits where desirable, but otherwise to prevent them. Such work is very desirable and should not be needlessly deferred, and it is therefore suggested that an item to cover the cost—for instance, \$50,000—should be added to the estimate for improving Yuba river.

"We have an estimate of the amount

of deposit from the Narrows to the State dam during nineteen years, 33,637,000 cubic yards, but no figures obtained by direct observation for the deposit upon the whole river area for any period at all. But it will hardly be questioned that the deposit over the upper portion of the river must have been relatively less during the last six years than it was for the earlier thirteen. The last six years have been relatively dry years, without notable freshets. Hydraulic mining has been under control since 1893, whereas the first thirteen years cover at least five years when hydraulic mining was at its highest activity. Finally, the sweeping of the upper canyons was pretty well accomplished prior to 1893, as there are reports from actual examination to prove. It would, therefore, appear that we are safely within the facts if we take the sum of the two averages and accept it as an expression of the annual rate of accumulation since 1893. The first average is 1,770,000 cubic yards, in round numbers; the second, 2,373,000, and the sum of both, 4,143,000 cubic yards. This figure may be used as an indicator of the length of time that the storage provided under the project of 1899 would last if there should be no increase of the annual requirement, and under present conditions this requirement should be a decreasing quantity.

"Comparing the foregoing figures with the storage estimates for the higher levels of the Narrows dam, the showing is favorable to the project of 1899, considering only the totals and rates, quite independent of the security afforded by the two systems. The 1899 project possesses superiority also in that it provides for future requirements if need should arise, while the Narrows dam gave no such outlook. Should harriers 1 and 2 be built and meet expectations, additional harriers can be built as required, each being a practical repetition of harrier No. 2, which may serve as a type for all of them. The estimates for the 1899 project are sufficient to cover the storage requirements for several years—perhaps ten, perhaps more. Having indicated the practical identity of the methods proposed for storing coarse material, the estimate made in former years may be accepted as safe figures for the costs as well as for the amounts of additional storage, with the understanding that the figures refer to coarse detritus."

I, FOR THE STORING OF DEBRIS, THE NARROWS, YUBA RIVER, CAL.

Mining and Metallurgical Patents.

Patents Issued August 5, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ELECTRIC FURNACE.—No. 706,099; A. Parker, Chorley, England.

Electric furnace combination with crucible a, positive carbon electrode h placed diametrically across crucible, rotatable supporting platform h, recessed base e, supporting plate c in two parts with recess into which platform base fits, worm wheel g around its periphery, worm f gearing with wheel g, chutes k to deliver material direct into arc, mechanism for raising carbon electrode h as crucible fills.

MEANS FOR SHAPING AND SHARPENING DRILL BITS.—No. 706,135; J. Wagner, Denver, Colo.

Means for shaping and sharpening bits for machine rock drills, combination with two co-operating die blocks, each having wedge-shaped recess, two other recesses each forming half wedge-shaped recess, each die block having hinged member on one side of wedge-shaped recess, suitable frame on which one die block is movably mounted, means for hinging faces of die blocks together, whereby bar from which drill bit is to be formed is securely held in place, means for holding hinged members of die blocks closed, means engaging one end of drill bit bar, for shaping bar to conform to wedge-shaped recesses of die blocks, means for releasing hinged members of die blocks, whereby they are allowed to open as die blocks are separated.

ORE SEPARATING APPARATUS.—No. 706,163; B. C. Cook, Deadwood, S. D.

Apparatus for separating ores comprising box or receptacle with longitudinal partition wall therein, lower portion of each compartment thus formed hopper-shaped, adjacent inclined walls diverging from and joined to partition, bottoms hinged to longitudinal edges of hopper-shaped portions, valved outlet from one compartment to other at top, feed pipe dis-

posed longitudinally of box, supported thereon at one end to deliver incoming material in direction reverse to outflow of material from box, flexible connection with pipe beyond its point of support whereby pipe may be swung laterally while supported on end of box, having overflow discharge passage at end over which material is fed, feed and overflow being opposite in direction.

STONE HANDLING APPARATUS.—No. 706,197; C. N. Owen, Mechanicsburg, Pa.

Stone handling apparatus comprising carrying truck, portable stone bin thereon, means for raising and lowering bin, screen mounted at top of bin adjustable therewith to receive stone from elevator and direct same into bin, stone crusher to which elevator is connected upon which it is adjustable.

MEANS FOR EXTRACTING PRECIOUS METALS FROM ORES.—No. 706,302; L. B. Darling, Providence, R. I.

In gold extracting plant, combination of grooved treating floor a, adapted to receive thereon comparatively thin layer of finely divided ore and treating solution constituting pulp, mechanically actuated rolling device arranged to be continuously propelled forth and back to agitate pulp or material lying on floor, suitable launders or ducts communicating with grooved portion of floor, and sump tanks into which metal charged solution is discharged from launders.

FILTER BED FOR CHLORINATION BARRELS.—No. 706,472; A. E. Johnson, Colorado Springs, Colo.

Combination with tank or harrel of class described, of filter located therein comprising grooved bars arranged side by side so that grooves in adjacent side of any two bars register, filtering material placed in spaces between bars, openings being left at top and bottom to allow solution to pass through filter, filter bars provided with lugs to support filter, corners of bars cut away at their ends forming openings for insertion of filtering material, hindering strips

covering end openings secured to tank to hold filter in place.

DEVICE FOR SECURING OR RELEASING TRAP FLOORS FOR ORE CARS.—No. 706,312; J. J. Galway, Duluth, Minn.

In mechanism of class described combination with suitable car having trap doors, of rod supporting same in such manner as to effect their release upon rotation, means for locking rod against rotation, lever for rotating rod having its outer end bifurcated, swivel block pivotally mounted between arms of bifurcation, and rod engaging swivel block provided with means engaging locking means for manipulating parts.

APPARATUS FOR LEACHING ORES.—No. 706,334; G. Moore, Salt Lake City, Utah.

Apparatus for leaching, comprising shell or body in form of truncated cone, head at each end having central opening, opening of small head being larger than that of large head, adapted to receive material to be operated upon, means for admitting fluid solvent through opening in large head, and discharging it through opening in small head, and means for actuating material through body and discharging through opening of large head.

APPARATUS FOR ELECTROLYTICAL TREATMENT OF ORES OR SLIMES.—No. 706,436; F. T. Mumford, Kalgoolie, Western Australia.

Apparatus for extraction of metals from their ores and slimes, comprising metallic drum, copper lining therein, means to maintain lining continually amalgamated, trailing electrical contact for drum, plurality of conductive bars passing longitudinally through drum and insulated therefrom, and means to rotate drum.

TREATMENT OF GOLD AND SILVER ORES.—No. 706,365; S. Trivick, Clapham Common, England.

Process for evolving nascent chlorine and effecting chlorination of metals, in order that they may be extracted from metalliferous mass by rendering them solvent, consisting in adding to mass mixture in definite proportions of two dilute solutions, one being solution of calcium hypochlorite free from calcium hydrate, other solution of ferric chloride, proportions being such as to result in formation of ferric hypochlorite, leaving some excess of ferric chloride, which will evolve nascent chlorine.

DESULPHURIZING SULPHIDE ORES PREPARATORY TO SMELTING.—No. 705,904; A. D. Carmichael, Broken Hill, New South Wales.

Process of treating mixed sulphide ores, consists in mixing with ores sulphur compound of metal of alkaline earths, starting reaction by heating same, thereby oxidizing sulphide, reducing sulphur compound of alkali metal, passing current of air to oxidize reduced sulphur compound of metal of alkalies preparatory to acting upon new charge of sulphide ores.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

Recent arrivals from Nome say that while the beaches are worked out, as far as rocking is concerned, new and improved machinery is being installed which will save a large part of the gold lost in the primitive rockers. The district is more and more taking on an air of permanency, and good strikes are being made. The creeks are being worked in a systematic manner, supplies are cheap, and, altogether, affairs at Nome, though they have not the boom air of a few years ago, are in a healthy condition. Nome City is now incorporated. There are around and about Nome City, including the population of that city and those who make it their headquarters, about 20,000 people. Work is plentiful and men are in demand. Wages are not as high as they were, but supplies are cheap and labor conditions are in better shape than before.

Pay dirt is being found in quantities on Otter, Dexter and Ophir creeks. The bench lands are also being worked profitably. The recent excitement has been at Candle creek, where considerable amount of gold was said to have been discovered. One claim on Otter creek is paying about \$8 a day to the man. The dirt is easily handled. In winter time it is thawed and banked up, and when the water begins to run, about the first of July, it is sluiced and bedrock cleaned. The bedrock lies about 20 feet below the surface, and there, of course, the best values are to be found. A system of drainage is necessary, for if the dirt sluiced is damp some of the gold is apt to be lost. Altogether mining in Nome has to be conducted on scientific principles, and the gold obtained is not gotten through mere luck.

The gold in the district lies in pockets, and is very uncertain. Pay dirt plays out at unexpected intervals, and is found where not expected. Two men made a strike directly on the top of one of the foothills that was one of the best paying propositions discovered in the camp. Pocket hunters are coming into the country and are making good finds. The quartz sources of the placer gold have not been discovered. The mountains have been but little prospected and an undeveloped field awaits the quartz miner.

The Anglo-Alaskan Construction Co. has incorporated in New Jersey to manage construction work of the Valdes, Copper River and Yukon Railway, which Helm & Abbot of New York and their English associates propose to build from Valdes to Eagle. F. C. Helm of New York, manager construction company, says that 30 miles of track, for which the rails are now en route to Valdes, will be laid before the end of December. He hopes to have the entire road completed through to Eagle City in two and a half years. The road will follow the Government trail for 100 miles from Valdes, thence crossing the Copper river, and taking an almost direct route through to Eagle.

Over 1200 quartz locations have been recorded at Dawson. During July 140 claims were renewed, development work being done on every one. The minimum amount of work allowed is \$100 worth. On many claims work was done running from \$300 to \$1500. More quartz claims have been surveyed during the last two months than ever before; the Government fee for surveying is \$250.

Valdes reports that D. J. Reynolds, a New York banker, and other New Yorkers have lost \$50,000 by the failure of mines on Cook inlet to produce gold as expected. Reynolds was the principal stockholder. He went to Cook inlet last month and returned to Valdes, accompanied by a mine expert who had gone north several weeks earlier to examine the property. The latter pronounces the mines of no value whatever and is quoted in an interview at Valdes as declaring that the project was a swindle. The mines were owned by a company which had some quartz claims on which considerable surface work had been done. Samples of some ore supposed to be taken from this property were sent to New York, assays proving them of high grade. The stockholders were apparently led to believe they had a bonanza. The promoters have left and the machinery lies idle.

The Rodman Bay Co. will put in a 60-stamp mill next season.

ARIZONA.

COCHISE COUNTY.

The Casey group of gold mines, near Wilcox, has been bonded by Eastern men. Manager Brockman of the Pearce mine is

pushing development work on the group. Adjoining the Casey mines is the property of the Mortar M. Co.—six claims—on which work will begin next month. The company has located four claims adjoining the Lucky Friday.—An 18-inch ledge of ore is struck at the bottom of the shaft of the San Juan property.—Another shoot of ore has been struck at the Banner, on Florida mountain.—The Adde mill is completed. The Swan Falls plant will furnish electric power to run the mill.

The Peabody, at Johnson, has resumed operations and will increase their force as soon as more miners can be had.

The Copper Bullion M. Co., at South Pass, is about to ship ore; a new working shaft will be sunk. Superintendent McManus has the main tunnel in 1000 feet; about 3000 feet of work has been done.

MARICOPA COUNTY.

Someone has said that anyone who has ever drank of the waters of the Hassayampa will ever have subsequent difficulty with the undiluted truth. From the Hassayampa, in the vicinity of Walnut Dam, now comes the statement "that between the dam site and the box canyon below lie 20 miles of river bed, ranging from 50 to 300 yards in width and teeming with gold; on top of the gold and bedrock is from 40 to 160 feet of sand, gravel and immense boulders. At the box canyon two large mountains come nearly together and the bedrock comes close to the surface, forming a cyanide tank 20 miles long and 100 feet deep. Nature has not only provided the tank, but has placed the gold therein and supplied the water, as well, and it now awaits the man who will add the cyanide."

MOHAVE COUNTY.

O. Ellis at White Hills has a lease on 250,000 tons of tailings and will erect a 50-ton cyanide plant.

SANTA CRUZ COUNTY.

The Buena Vista M. Co. are planning a reduction plant, daily capacity 300 tons of ore, on the Santa Cruz river, east of Nogales.

YAVAPAI COUNTY.

The Float Rock G. M. Co. will start work on its property, 1 mile from McCabe.—The Empire mine expects to have 100 men at work by October 1.

The Federal M. & M. Co., Cherry Creek, has a ledge which averages \$30 and expects to have a mill in operation by the first of the year.

The Iowa M. & D. Co. will survey its claims for patenting. The property of this company lies between the Monarch and the Federal, and it may spend \$50,000 developing it and erecting a mill.

Men from the United Verde, Jerome, tell the Phoenix Republican that both the mine and smelter are practically closed down and 500 men are out of employment. Few are retained except the machinists and those who could assist in the efforts being made to stop the fire in the mine.

There is plenty of ore on the two lower levels to keep the smelter running, and it is available through the new shaft; but, since the fire broke out, a shaft in the big engine room was broken, and it was thought better to close the smelter temporarily for repairs. It is believed now that the fire has spread as deep as the fifth level, and the old shaft is impenetrable for gas. The openings from the new shaft to the upper levels are bulkheaded, so the gas cannot escape into the new shaft. It is said that in one little stove a fire has been burning for years, and from the vast amount of sulphur in the ores it is hard to predict the result of the present fire. While no one knows how it originated, it is the theory of some that a miner left a candle burning, from which a timber was fired, and from that the combustion of the ores was started. The ground over the burning region is considered unsafe. While it delays operations at the mine and stops the output, it cannot burn up the copper; and though it is a matter of loss to the company, they probably will not feel it as much as the hundreds of men thrown out of employment. W. A. Clark is there to confer with the mine management over the situation, and see what course is best to pursue in an effort to stop the fire. The employees of the company did all they could to help so long as their services were desired, and many took chances on their lives in trying to approach the fire, the gas turning them back.

The Congress G. Co. will put in a new pumping plant to take the place of the one destroyed by the dynamite explosion last week.

Superintendent W. J. Martin of the Monarch M. Co. is working the old Mocking Bird group, Cherry creek district, sinking a 500-foot shaft on a ledge 8 feet wide between walls. About 40% of the ore is free milling. Some of the ore assays \$40.

Manager J. H. Canavan of the Big Bug G. & C. M. Co., on the property about 2 miles east of Mayer, has a double-com-

partment shaft down 200 feet. It is his intention to push it to a depth of 300 feet. He has been pumping 40,000 gallons of water per day from the mine. He has the mine equipped with a 5 H. P. gasoline hoist and a 12 H. P. gasoline engine to run the blower, pump and electric drills.

CALIFORNIA.

AMADOR COUNTY.

Near Pine Grove, the new 10-stamp mill at the Defender is nearing completion.—Twenty stamps will be running this week at the Mitchell mine. The buildings will be electrically lighted.—Superintendent Platts of the Mountain Queen, formerly Anaconda, has started a 200-foot tunnel to tap the old shaft.—The Edinburg G. M. Co. are surveying to determine where to sink a shaft and erect a mill.—The east level in the Amador-Phoenix mine has reached the Roger & Bowden shoot.

The Sutter Creek Record says that sinking is to be resumed at the Gwin mine. The present depth is 1840 feet. The 80-stamp mill is in regular operation.—The Onelda mill is running forty stamps. Sinking will be resumed from the 2000 level. The last clean-up of the mill netted \$8000 after paying running expenses.—The Record hears that the North Star and South Keystone quartz mines will begin operations as soon as the title to the former property can be adjusted.—At the Wildman mine a new level is being opened up at the 1400; ore developments flattering. About seventy-five men are employed and thirty stamps of the mill are crushing with satisfactory results.

The Jackson Ledger reports operations at the Argonaut at a standstill.—The Horn mine has found the ledge.—At the Mitchell ten stamps are at work. The other ten stamps start next week.—At the Sargent a set of timbers is being put in every fourth shift, which would give the contractors about \$4 per day per man.—At the Bunker Hill \$135,000 has been spent in the purchase of the property and development work.—The Bay State is working the 10-stamp mill on ore from the 850 level.

N. R. Ellis, local manager of the Standard Electric Co., tells the Jackson Dispatch that the company will build the Deer valley dam, 8 miles below lower Blue Lakes, at once. The dam will be 100 feet high, 725 feet in width on the crest. It will impound 2,750,000,000 gallons of water and provide storage facilities to run five machines.

The Shenandoah at Plymouth has completed its crosscut to the ledge at the 750-foot level.

At the Hercules mine Shields & Noe are building a 5-stamp mill.

Dr. Boyson of Sutter Creek has men clearing out the old shaft on the Butler property.

The Bay State mine, north of Plymouth, shows fine prospects at the 800-foot level.

BUTTE COUNTY.

Effort is being made to mine the gravels which lie beneath the town of Oroville. O. Enslow is sinking a 4x6 shaft to mine the gravel. He expects to reach bedrock at 30 feet. The water is handled by a centrifugal pump. The shaft is near the point where years ago an effort was made to work by pneumatic tubes, into which air was pumped under the theory that the pressure would hold back the flow of water. The scheme failed, as did many others which had for their object the mining of the rich strata.

CALAVERAS COUNTY.

Mokelumne Hill reports an old-fashioned placer at Lancelle gravel mine, operated by P. L. Shuman. In a run of eighty hours 361½ ounces of gold were cleaned up; mint value of that gold being \$18 41 makes \$6646 01.

The Maltman G. M. Co. has been incorporated by D. Cosgrove of Fresno and G. E. Stickles, W. Rose, J. G. Maltman F. J. Solinsky of Calaveras county.

At the Lancelle gravel claim, 2 miles from Mokelumne Hill, another clean-up is reported as having been made last week, after forty-two hours hydraulicizing, giving 107½ ounces of gold; one of the nuggets weighed two ounces.

COLUSA COUNTY.

The Bank of Williams has shipped quicksilver to San Francisco, hauled from the mine on Sulphur creek and weighing nearly 40,000 pounds, amounting to \$20,000.

EL DORADO COUNTY.

Near Fairplay, N. H. Burger is opening the river mine on the old Cosumnes.

INYO COUNTY.

G. Montgomery will sink the shaft on the Black Eagle mine at Ballarat 200 feet deeper. The present shaft is down 215 feet and will be enlarged and timbered before sinking begins.—The Radcliffe Co. at Ballarat has leased the water plant of the South Park M. Co. and will pump

water for the Radcliffe mine. The property is operated upon a paying basis.

Troeger Bros. of Cerro Gordo will resume operations upon the Dunphy mine September 1. They will put in a new hoist and other improvements.

KERN COUNTY.

Gas pressure is traveling across the Kern river field from east to west. The Imperial was one of the first wells affected. It spurted oil 50 feet above the top of the derrick. The disturbance has since repeated itself in a modified form. Not long after the Aztec well No. 7 was affected similarly and a little later the well on the Knob hill lease showed the effects of the gas pressure. One of the theories offered for the phenomenon is that the thousands of barrels of oil which have been taken out of the earth have left holes that must be filled with something and the most natural filling for them is gas. A great weight, the theory proceeds, has been lifted off the oil underground by a removal of a portion of the oil itself and the evolution of gas has been the result. This gas, having formed in great quantities, has created a pressure of its own and is making its way through the sands, travelling from the point where the force is greatest to the point of least resistance. If this theory is based upon a scientific presumption, a reasonable prediction would be that the more oil that is removed the more gas will develop until the wells throughout the field will become gushers, and that, finally, when the territory has become exhausted of oil, a great natural gas belt will remain.

MADERA COUNTY.

At Coarse Gold, T. Clark has bonded the Lingo mine.—The Alpha is working twenty men.

MONO COUNTY.

D. M. Riordan says: "In June, 1878, I was working in Carson, Nev., and was asked by my immediate superior, H. M. Yerington, how soon I could clean up my detail work and get ready to go out to Bodie. I told him I could be ready in a few hours. He said, 'I wish you would get ready to take the stage to-morrow morning and go out to the Syndicate mill.' I had my work 'rounded up' and was ready to leave on the following morning's stage, and upon my arrival took up duties of a subordinate character which I did my best to perform. In the course of a couple of months or so I was superintendent of the mill, which was then running as a custom mill on Standard ore. The Standard mine at the time was the big producer and dividend payer of the camp. Bodie was a typical mining camp, situated at an altitude of about 10,000 feet on the eastern slope of the Sierra Nevada and only about 4 miles from the Nevada State line. It was about 8 miles west of Aurora, one of the old phenomenal mining camps of Nevada.

"The Syndicate mill was a brick mill, the machinery in it being the odds and ends of half a dozen old mills put together to work Bodie ores. It was 115 or 120 miles from the nearest railway station. Freight was 2 cents a pound from the railroad. Wood was \$12 a cord. The camp grew from practically nothing to be a town of 10,000 people in a year and a half. The Standard mine, which was bought for \$40,000 by owners who never saw it, started in paying \$25,000 a month dividends after it was got in shape to work. These dividends were soon after increased to \$50,000 a month and subsequently to \$75,000, and during the three years I had knowledge of the property it never missed a dividend.

"There was one place in the mine that was called 'The Treasury.' The ore from this place was said to go \$10,000 to \$20,000 to the ton, and it was the custom whenever there were any extraordinary expenditures, in order to not diminish the dividends, to go into this place and get out a ton or two as needed to keep up the month's ordinary and extraordinary output.

"The Bodie mine was the adjoining claim on the south, and was sunk to the depth of 220 feet with a horse whim. The veins in Bodie hill were supposed to run practically parallel and to dip towards the center as depth was gained in a manner similar to the fingers of one's hand while held up with the open palm. Acting on this theory the Bodie folks decided to run a crosscut on the south line of the Standard property, which was the north line of their claim, and at the depth of about 250 feet. In doing this they intersected fifteen or seventeen different veins. The main vein, or the one which was supposed to be the Standard vein, showed little or no value where it was intersected, but a smaller vein, called the Burgess vein, showed some values and on this vein a drift was run which in going south a distance of 26 or 27 feet developed a chamber of ore over 9 feet in width, and which run up to nearly \$100,000 a ton.

"The Bodie folks immediately made arrangements with the Standard people to

change our mill from Standard ore to Bodie ore, and from that chamber of ore we milled and shipped over \$1,000,000 in gold bullion in six weeks. During the crushing of this ore, so rich was it, we ordinarily could not run more than five stamps, or one battery, although the mill was a 20-stamp mill with pan capacity to correspond. We have had the amalgam accumulate in the pans, not once but frequently, so that it would stop the engine.

"In one day's run, that I remember, we got about 900 pounds of gold amalgam. I have had the gold accumulate in a battery until, recognizing by the sound that the stamps were no longer crushing rock and that they were not striking iron, I would take off the screen to find that the gold had accumulated in the bottom of the mortar until it was flush with the dies, and I have taken out of a single mortar with an ordinary iron fire shovel, such as we used in cleaning up, free gold enough to fill a Wells, Fargo express box. Eighty pounds of amalgam from one charge in the pans was a very usual thing during that run of ore, and we were obliged to retort during the whole time as rapidly as the retort could be cooled and a fresh charge of amalgam put into it.

"During the run of this ore, Peter Holmes, Bob Pixley and myself one day went into the mines, and, before going, stopped at one of the stores and got an ordinary 5-pound shot bag to take with us for a sample sack. We filled this shot bag with loose dirt scraped out of the face of the drift with our hands. From this we panned out, in Peter Holmes' office after coming down, gold enough to make four matchboxes. Any miner will understand what this means. It is a fact that this run unfitted some of our best men for ordinary mines or ordinary ore thereafter.

"After the richness of this ore and the fact that it was likely to be continuous for some time, at least, became established, more or less watch was kept upon my movements. Sometimes Jim Dawley, who was then the superintendent of the Standard mill, represented the Bodie Co. in receiving and melting the bullion, used to come down to our mill and get the results of the day's work. At other times, if it was late or inconvenient, rather than take the risk of carrying the bullion over night in the little wooden shack, I would take it up to him in our ordinary mill wagon. I had a pretty good team, which all the Bodieites will remember—old Selim, in particular. One evening, when I was to have gone up with the bullion myself, something occurred at the last moment to detain me at the mill and I sent another man up in my stead. That was the last we saw of him alive. The horses ran away just as they were entering the town, and when they were stopped the poor fellow was found lying in the wagon riddled with buckshot. The bullion was untouched. No trace of the murderers was ever discovered."

The Syndicate M. Co. of Bodie district reports \$4170.31 cash on hand Aug. 1, 1902. The Goleta Co. at Jordan will resume. Superintendent Nelson will make a raise from the 700-foot tunnel level to the 350-foot level, where there is a 35-foot ledge of \$12 ore.

NEVADA COUNTY.

The Empire mine, near Grass Valley, employs 140 men. It is projected to sink from 2800 feet—the present depth—to 3500 feet; and, with this idea in view, Superintendent Starr has put in a forty-drill air compressor.

The Pennsylvania plans to resume about the 18th.

The W. Y. O. D. Co. will turn its attention to the Kate Hays property.

E. Creller, superintendent Union Hill mine, says that the company is now working toward the reopening of the property.

At the North Star Superintendent Foote is reported to have the same rich ledge at the 1900 level that was tapped at 1100 feet.

PLACER COUNTY.

The Sentinel says that the Haub drift gravel mine at Shady Run has been sold to Tacoma, Wash., men, incorporated under the name of the Haub M. Co. G. T. Crozier of Tacoma is manager and R. Watson is superintendent. The mine has been operated for several years by Mr. Watson.

SAN BENITO COUNTY.

A company to reopen and develop the Cerro Conito mines is about to organize at Hollister.

SAN BERNARDINO COUNTY.

The city of San Bernardino has plans prepared for 12 miles 4 to 20-inch cast iron pipe and 20-inch steel mains for a new water supply to be secured from artesian wells and mountain streams.

Brown-Gosney Co. of Manvel have bought the Wanderer group of claims, 50 miles west of Manvel, 1½ mile southwest of Tennenbaum's turquoise camp, for \$10,000. This is a silver and gold property, and

has been worked for seven years. It is the intention of the new owners to unwater the mine, sink the shaft 200 feet and commence extensive drifting and crosscutting.

The Bagdad M. & M. Co. is working sixty men and daily extracting 100 tons of ore. The best of it is milled, the remainder piled up to await completion of the railroad.

The Ludlow & Southern Railway has incorporated in Los Angeles to build a railroad to connect with Ludlow on the Santa Fe on the desert, and to run to three mining camps, 8 to 15 miles away. It will be narrow gauge and will run to the Gentry camp, thence to Camp Rochester, with a branch line to Roosevelt.

The Ontario M. & M. Co. has incorporated at Ontario; W. Kaiser, H. B. Wilson, J. D. Henderson, J. Kennedy and T. E. Parke.

The Bronze mine at Vanderbilt is working ten stamps.

SAN DIEGO COUNTY.

W. E. McEwen, superintendent for the company that recently bought the Nobles' group of claims at Pine Valley, has put on all the idle miners he could find in Julian.

SANTA BARBARA COUNTY.

The refinery plant at Carpinteria is being completed. The Union Metal Co. has a dug well containing 1000 barrels of liquid asphaltum, from which to draw for the first work of their refinery. Their well is down 675 feet, with 13½-inch casing. It will probably reach the asphaltum stratum in 350 feet more.

It is now planned to consolidate several hundred wells in the Summerland district. If that goes through, nine-tenths of the interests in the oil district of Summerland will pass into the control of the syndicate, scores of pumping plants now operating independently abandoned, a large plant capable of operating all the wells constructed and the pipe lines changed so that the product of all the wells will flow into one reservoir. Nearly all the Summerland wells are in the ocean, short distances from the shore, and are among the most productive in the State.

SANTA CLARA COUNTY.

The Silver Creek quicksilver mines have resumed operations with increased furnace capacity. Under the new arrangements the output of the mine has been doubled. Hereafter it is proposed to treat thirty tons of ore per day.

The Santa Teresa property, on the Almaden road, is being put in shape to become a producer. The force of workmen is being increased.

SHASTA COUNTY.

The Keswick Crude Co. has an offer from a driller of Berkeley to sink an oil hole at \$2 a foot for the first 500 feet and an increase of 50 cents a foot for each subsequent 500 feet, to furnish everything but the casing.

A concentrating plant for the Washington mine, French Gulch, is being put in by J. S. Farrier, managing owner.

A hoist for the Union Creek G. M. Co., Coffee Creek, will be put in.

The Little Waxie mine, Shasta divide, is bonded by B. M. Newcomb of the Old Spanish and Uncle Sam mines. J. P. Munger will have charge of development work.

Manager Kendall has twelve men developing the Phoenix mine, formerly known as the West End, now under bond by the Mount Shasta M. Co.

SIERRA COUNTY.

Superintendent Morrell, at the Balsam mine, near Alleghany, has been working an upraise to strike the Red channel that crosses the property; the task is accomplished and pay gravel is now being taken from the channel.

W. H. Weldon has a mining property 3 miles southwest of Bald mountain that he proposes to develop this season.

SISKIYOU COUNTY.

(Special Correspondence).—A large vein of quartz has been struck in the Aida claim of the Yreka M. & M. Co.'s property, near Rollin. A contract tunnel was run in by Woodfill & Lewis and about 80 feet from the surface the quartz vein was struck. It shows an average value of \$7 per ton. The company are going to run about 1 mile of tunnels, drifts and raises, all by contract, the coming season. The cost will be less than \$4 per foot. All the ore will be broken by contract also, the miners agreeing to deliver ore in chutes for 60 cents per ton. The cost of mining and milling is not expected to exceed \$1.50 per ton.

Rollin, Aug. 12.

The Salmon River Co. have suspended work on the Myers claim, below Sawyer's Bar. Two giants and one elevator were used successfully and the company realized well from the season's clean-up. One more season's run can be made from this

claim. The company are contemplating a move to Summerville on the South Fork of Salmon river by the end of next season. It will be necessary to construct 8 miles of flume at a cost of about \$50,000 to carry sufficient water from the South Fork to Summerville.

J. Churchill and H. Steele are doing preliminary work above Fall Creek falls to install an extensive power plant. They intend putting up poles 30 feet high, 6 inches in diameter at top, to transmit 30 miles. They will have 700-foot fall to operate the dynamo below the falls.

The Siskiyou Electric Power Co. has begun the construction of an electric plant on the Klamath river; 2800 feet of pipe will be laid; capacity of plant, 2500 H. P.

Preparations are making to reopen the Greenhorn blue gravel mine, near Yreka. The bedrock strata of rich pay gravel, over 100 feet below the surface, contains an immense amount of water, requiring pumping to be kept up continuously.

STANISLAUS COUNTY.

A Keystone steam drill, weighing 17,000 pounds, is at Waterford, to be used at La Grange, in connection with the other drills at work for prospecting the gravel beds along the Tuolumne river for J. E. Doolittle and A. Brown, who are prospecting the river at La Grange for gold dredging purposes. The same people also have a steam drill at work on the Stanislaus river between Oakdale and Knights Ferry. The Independent says J. E. Doolittle will shortly place another drill on the Merced river, in the vicinity of Snelling and Merced Falls, to prospect the gravel for gold dredging.

TRINITY COUNTY.

A carload—62,000 pounds—of sulphurets from the mill of the Brown Bear mine, Deadwood, has been shipped to the smelters at tide water.

TUOLUMNE COUNTY.

P. George Gow, general and mining superintendent of the Jumper Gold Syndicate, California Limited, has brought suit against the company to compel an accounting and the payment to him of one-tenth of the net profits of the concern since July, 1896. The claim is based upon a contract made by him with the company at the time it became interested in the Jumper and other claims, and alleges that he was engaged for ten years to manage the property at a salary of \$420 per month and one-tenth of the net profits. This division of the profits was to be paid to him for his services in negotiating deals for the properties and was to continue as long as he lived and five years after his death. It is charged that the company never has paid him anything from the profits, and that on July 30, 1902, it declared that that part of the agreement was invalid.

At the foreclosure sale of the Moody mine property at Sonora, W. A. Nevills became the purchaser—\$10,000 for the entire property.

YUBA COUNTY.

At Browns Valley the development work or the search for a lode or vein in the old Pennsylvania mine ceases. A company represented by L. Scrutton has expended \$30,000 in an effort to find a new lode or an extension of the old vein that had been worked at different periods since 1856. Mr. Scrutton has paid all claims contracted under his administration and ordered the mine closed, as far as his company and contract are concerned. The great volume of water in the Dannebroge, Pennsylvania and Jefferson is said to be a bar to further expenditures.

From Browns Valley district a deed from S. L. and G. Lezinsky, president and secretary of the Commonwealth Gold Mines, Ltd., and Victor Gold Mines, corporations, has been recorded to Julian Sonntag of San Francisco—the Dannebroge quartz lode, the Pennsylvania mine, the Hawkeye, North Light, F. W. P., Victor and Blow Snake mining claims. The deed is a conditional one.

COLORADO.

BOULDER COUNTY.

(Special Correspondence).—The Boulder Amazon Oil & Gas Co. have their well down 1600 feet. They intend sinking to 3000 feet if necessary. They struck oil in the first oil sand.

The Crawford well have their new rig up and are going to sink another well at once.

The McAfee Co. are also going to drill another well.

Boulder, Aug. 8.

The Boulder News says it is the driest in the mountains ever known. Many mines that usually have to be pumped the year round are perfectly dry, and some of the camps are suffering for water for domestic purposes.

CHAFFEE COUNTY.

A very rare and valuable body of min-

eral on Crystal creek, 15 miles northeast of Salida, has been found; it is asserted to be bismuth ore of high percentage, eleven ounces gold and \$145 bismuth being the value of a 50-pound sack of ore taken by Ohalen & Flynn, miners from Cripple Creek, from the bottom of a 10-foot hole.

The Salida smelter, now nearing completion, is the property of the Ohio & Colorado S. & R. Co. on the main Arkansas river, 2 miles from the business center of Salida. The capital for the enterprise comes mainly from Cleveland, O., and vicinity, and already about three-quarters of a million have been expended in construction work. J. C. Kortz of Cleveland, O., is the president of the company, T. Goodwin of Denver and Leadville is the general manager. The other officers of the company are: H. G. Reddington of North Amherst, O., vice-president; J. M. Thomas of Columbus, O., treasurer; H. G. Steinbrenner of Cleveland, secretary. These five constitute the board of directors of the company. The chief owners of the smelter are also the chief owners of the New Monarch mines at Leadville. This property will supply some ore to the smelter, the management stating that the production will be an average of 300 tons per day. Contracts for ores are being made. All characters of ore will be treated and are wanted, excepting zinc ores. There are two furnace buildings now complete, the lead and matte furnace buildings. The lead furnace building is 40x120 feet, walls 24 feet high. There are four furnaces, each with a capacity of 160 tons per day. In the rear of this building and on a foundation 6 feet higher is the matte furnace building, 40x60 feet, two furnaces, each with a capacity of 300 tons a day. These two buildings are so arranged that the tops of the furnaces are all on a level. There will be one feed floor for all of the furnaces, enclosed by a corrugated iron canopy top. Between the two furnace buildings is the flue chamber, which extends 300 feet on a level with the foundations of the furnace buildings and then turns at right angles up the mesa bench to the stack, a total distance of 673 feet. The stack is 150 feet high, 30 feet square at the base. This gives the total draft through the flue chamber and stack 823 feet. The flue chamber is 24 feet wide at the base and is arched over, the top of the arch being 24 feet above the floor.

George Briethaupt is superintendent of the Futurity mine, 6 miles north of Turret. The ore vein is 3 feet in width—\$2 gold, \$2 silver and 25% copper. It is owned by an incorporated company, of which George Smith of Cripple Creek is president.

CLEAR CREEK COUNTY.

At Yankee the Silver Creek Mineral Co. is formed on a reorganization plan from the old Alice M. & M. Co. The new company has laid out a townsite and plans are formulated for extensive improvements, among which is contemplated an electric line of railway from Idaho Springs to the property.

Yankee also reports a strike in the Lombard, a property of the Yankee Con. M. & M. Co. In the second level of the mine in the slope the vein is 11 feet wide of smelting ore, the remainder mill ore worth \$15 a ton.

At Empire the Republic Con. is excavating for a new mill at the foot of Douglas mountain, for the treatment of their ores exclusively.

H. H. Sturm will put in a 1000 H. P. plant on Bard creek.

C. H. Fuller is foreman Conqueror mine at Empire.

At Silver Plume it is reported that the Mexico & Seneca group, consisting of several patented claims, will resume operations. The property is under the management of C. H. Morris. The last ore extracted gave returns of 302 ounces silver and 40% lead. The main tunnel or adit level has a depth of 750 feet. The mine was closed during 1893.

The strike in the Burleigh tunnel continues to improve. This was struck on the 7:30 lode, being driven to connect the Burleigh tunnel with the 7:30 and Bismarck group. A drift 1300 feet westward from the Burleigh and raising 240 feet will connect the two.

Manager Dean Burgess of the Republic Con., near Empire station, tells the Georgetown Courier that the tunnel of this company is in 243 feet, and has just cut a 24-foot lode carrying pyrites, peacock copper, gold and silver in a series of streaks across the lode. The grab samples assay about \$120 a ton. Manager Burgess says the company is breaking ground for a new concentrating mill for Republic ores.

East Argentine district is active, many properties being developed, the Santiago, North Star, Waldorf, East Argentine Co., Vidler and other properties doing considerable work. East Argentine produces smelting ores. The East Argentine Co. and Vidler Syndicate are erecting dams;

their first use of the water power will be for operation of air and electrical drills.

CUSTER COUNTY.

The Maverick mine at Rosita has been leased and handed to the Custer M. & R. Co., who will sink a new shaft.

The Powhattan mine, Silver Cliff, has been leased to C. H. Aldrich and A. B. Robinson of Jackson, Mich., and W. H. Bliss of Chicago. The mine is being enlarged.

CILPIN COUNTY.

(Special Correspondence).—The Delmonico G. M. Co. here are down 800 feet and sinking 3 feet per day. They intend to go 1200 to 1500 feet before stopping. The policy of this company is to develop and block out ore before shipping. J. H. Eaton is secretary and treasurer.

Central City, Aug. 9.

During the last week of July the shipments of smelting and crude ores, mill tailings and concentrates from the Black Hawk depot to the Golden and Denver smelters and to outside points were 96 cars of 1920 tons, making a total of 409 cars, or 8180 tons, for the month of July. In comparison with the same month of the previous year, last month's shipments show a gain of 99 cars, or 2450 tons, an increase in the tonnage of nearly 50%.

CUNNISON COUNTY.

(Special Correspondence).—I. L. Johnson of Culpepper, Va., is developing his property on East Gold hill, Tin Cup district, driving a tunnel to cut the vein at its deepest point, 800 to 1000 feet deep, to be 1 mile in length, and will run on the vein nearly all of the way. The vein as far as developed has produced pay ore at three different points.

Gunnison, Aug. 9.

The destruction of the Colorado Fuel & Iron Co.'s power house at the Crested Butte mine by fire has caused a temporary suspension of coal production. Several boilers and a large compressor were practically ruined. The loss is estimated at \$20,000.

At Apex Manager Mounts will start the Elk Park mine and mill for the Eastern men who recently bought the property.

LAKE COUNTY.

(Special Correspondence).—The Blaine Electric & Power Co. will put a gasoline engine and an electric power drill on their property. The company has 250 acres of mineral land and 300 acres of timber. They employ at present eighteen men around the mine. They have a tunnel in 150 feet and intend driving it to cut the thirty veins on the property. The ore is gold, gray copper and silver. With the new drill they hope to be able to drive 8 feet per day; W. H. Applegate is general manager.

Twin Lakes, Aug. 10.

Near Leadville the Silent Friend mine in Big Evans gulch is reported shipping 400 tons per month.

Regarding the trust ruling as to Leadville assayers in last week's issue, a modification of that rule is now reported. Instead of its application being general, it is confined solely to the Arkansas Valley plant. All ore sent to the valley can be umpired according to the method heretofore in vogue—that is, the smelter furnishes a list of assayers, some in Leadville and some in Denver, who are considered by them to be satisfactory. The mine and smelter alternate in picking an umpire from the list. But under the new rule this only applies to ore shipped to the valley. Ores for the local plant follow the rule stated last week—that is, settlement on the smelter assay or umpiring with Denver assayers named by the smelter. Splits are allowed on ore going out of the camp, but not otherwise. The reason for this limitation of the rule to the Arkansas Valley plant would seem to be that much of the trouble over assays is in the case of gold, and at present the Arkansas Valley is receiving the bulk of the siliceous ores, while much of the sulphides and iron goes to the valley. The smelter is taking a large quantity of low-grade material from the gold belt, and it is evidently the purpose to force a settlement for this ore on practically whatever terms the smelter may dictate. But even with its more limited application, mining men consider the enforcement of the new rule as arbitrary, and are inclined to believe that it is part of a well-considered policy on the part of the trust to bring about certain changes, but, realizing that there would be a "howl," it has decided to introduce the changes gradually, so that the miner would become used to them, but that eventually the rule would be extended so as to cover all ore shipped from the district, thus placing the assay basis of settlement wholly in the hands of the smelting company.

Shipments by the Gold Basin M. Co. and the work now being carried on through the new shaft sent down by them on the old Big Four ground indicate to Leadville people that they have the extension

of the old Big Four vein, which as developed is almost vertical in the quartzite.

Manager Brooks is pushing drifting and prospecting on the Diamond shaft and is drifting for the Resurrection ore shoot extension.

LARIMER COUNTY.

(Special Correspondence).—The Boston & Colorado Copper M. Co. are making arrangements for the erection of a smelter at this point.

Fort Collins, Aug. 8.

PUEBLO COUNTY.

The American Smelting & Refining Co. has closed the Philadelphia smelter at Pueblo because of a shortage of ore, and a new smelter has just been started at Murray, Utah.

SACUACHE COUNTY.

(Special Correspondence).—The Little Sister G. M. Co. are developing their tunnel. Their ore is a concentrating proposition and will average about \$30 per ton, carrying gold, silver and lead.

Bonanza, Aug. 7.

SAN JUAN COUNTY.

Near Silverton, Superintendent Halverson of the Freeport & Cripple Creek G. M. Co. is pushing operations on old properties, containing twenty acres, on Tower mountain.

Near Silverton the drills at the Grand Mogul mine, upper Cement creek, have cut the main vein 1700 feet from the mouth of the tunnel and opened up an ore body 24 feet in width, averaging \$15 per ton.

SAN MIGUEL COUNTY.

Copper claims have been discovered 15 miles from Telluride.

The county and two mining companies at Telluride offer \$6000 reward for the arrest and conviction of the person or persons who caused the disappearance and death of two residents of Telluride.

SUMMIT COUNTY.

(Special Correspondence).—The Mountain Pride Gold Mines Co., D. P. Marvel manager, employs twenty men and is taking out ore. They shipped nine cars of concentrates and one car of crude ore in three weeks of last month. When their elevator is repaired they will double their output.

J. A. Bush of Salt Lake City is getting the Glen-Mohawk M. Co. started. He has been straightening up the property, running a tunnel and doing considerable development work in the mine. The tunnel now has a length of 700 feet.

Breckenridge, Aug. 8.

(Special Correspondence).—The Goldpan M. Co., George H. Evans general manager, have their tailings ore dump completed and ready for operation. The elevator sluice boxes are dumped onto a belt conveyor and carried at an angle of 27° a distance of 110 feet, thence dumped to another conveyor which runs on an angle of 7° a distance of 300 feet. The total radius of the conveyor is 410 feet and tailings are stacked to a height of 72 feet automatically by means of a tripper. The Goldpan people have the largest plant of its kind in the country. They are now putting in pumps to overcome the shortage of water. They are within about 2 feet of bedrock, but it will probably be two weeks before they reach bedrock.

Breckenridge, Aug. 8.

Near Frisco, the Admiral group of mines is to be worked by machinery and the development tunnel, 4½x7 feet, driven by electric drills with two shifts of men.

The North American G. D. Co., at Breckenridge, has produced five gold nuggets aggregating in weight 390 ounces 6 dwts. The Bucyrus dredger is daily handling 2000 tons of gravel; the ground sluices are showing up well.

TELLER COUNTY.

The Moon-Anchor mine has been leased to N. Wilson.

E. M. De La Vergne, general manager Elkton Con. G. M. Co., says of developments in the 700-foot level of the Elkton mine: "One can get almost any values desired, so it is not right to say at present what the average value of the ore will be. We have sunk a winze about 10 feet deep below the floor of the seventh level, and find that the vein is contracting and is apparently about 3 feet wide. The values seem to have been compressed into this vein, which produced a high grade of ore, instead of being disseminated through the mass as it was in the level."

The old Oneida and Detroit mills are dismantled. Since the inception of the camp there has been a total of fifteen mills in the camp, and to-day there are but three operating—the Brodie, Aregua and Economic. The others were of that type not adapted to the treatment of the ores.

J. K. Brewster has been appointed Inspector Londonderry G. M. Co. and the Wild Horse, owned by the United Mines Gold Co.

Victor reports 5 feet of mineral developed on the 500-foot level of the Ritten-

house claim that runs less than pay, but with a streak 13 inches wide that runs nearly \$100 gold. Manager R. G. Mullen will extend laterals on other levels to the shoot.

A strike of sulphide ore carrying 4000 ounces of silver and a percentage of copper is reported on Bull hill, the center of the Cripple Creek district, at a depth of 1365 feet. This would seem to bear out the theory that deep mining would change the character of the district's output.

At Cripple Creek Manager J. W. Phillips of the Ben Hur M. & M. Co. says that the shaft, which the company has sunk 650 feet, will be sent down to the 800-foot level.

The annual report of the Independence Con. G. M. Co. for the year ending June 30 has been received by the stockholders. The cash on hand June 30 was \$12,286 95, with bills payable amounting to \$21,000. The report of General Manager W. P. Dunham shows 2745 feet of sinking, drifting, crosscutting and level work accomplished during the year, with 563 feet of upraising, 65 feet of winzes cut and 141,734 cubic feet of stoping done. The main shaft, from which operations are conducted on company account, was sunk 203 feet, its present depth being 1082 feet. A station, 15x16x26 feet, was cut at the ninth level on both sides of the shaft. The Glorieta M. & L. Co., on the Whiting lease, accomplished 931 feet on levels, crosscuts and drifts, sank the shaft 83 to 87 feet and accomplished 72,630 cubic feet of stoping. On the Worthing Moon lease 230 feet of drifting and crosscutting on levels was done. Mr. Dunham reported that the damage to the mine caused by the settling of machinery was not serious, the loss being under \$2000. The lessees have resumed operations through the main shaft, which is in better condition than ever, and hoisting and other mining operations are progressing without interruption. Up to the time of this accident the company was receiving about \$6000 in royalties. The shutdown was entirely responsible for the company's deficit of approximately \$9000. All taxes and expenses are paid to date. The lessees are establishing a station at 1050 feet, and are unwatering the mine. The water situation has at no time been troublesome. Crosscutting will start as soon as the lower workings are dry, which is expected daily. At 950 feet a new ore shoot, not less than 300 feet long, has been developed in the heart of the property. The organization owns forty-six acres of inside property in the town of Independence, of which the Hull City placer is the most important. The company is capitalized for \$2,500,000, divided into as many \$1 shares. Eren Smith is president, W. S. Montgomery vice-president, E. G. Thomas secretary and treasurer.

At Victor the Bull Hill M. & D. Co., Superintendent R. D. Wattles, will explore the twenty acres of the Cresson M. Co., lying south and west of the Gold Sovereign, on Bull and Raven hills. The base of operations will be the Marie shaft on Raven hill, where at a depth of 300 feet a crosscut will be driven east for 300 feet into Bull hill for the Fox vein, which, it is believed, will be cut at a depth of 500 feet.

On the 9th inst., the Brodie mill, in Squaw gulch, was destroyed by fire. The mill was leased three months ago by O. B. Finn, and had been running steadily since he obtained the lease on low-grade dump ore, which was being successfully treated. Mr. Finn's loss will amount to about \$4000, which was in material and ore in the building. The mill was owned by the Gold & Silver Extraction Co. of North America; it was built in 1893 at a cost of \$150,000. For some time W. A. Russell of Denver has been general manager for the Scotch syndicate. An insurance of \$35,000 was carried. This is the last of three mills which were built in Squaw gulch. The Rosebud mill was burned and the old Hartzell mill was torn down.

On Rhyolite mountain M. O'Hara will do 1000 feet of boring with a diamond drill in the Metallic tunnel. It is estimated that this prospecting work will cost over \$4000. The Metallic tunnel has been driven 800 feet and a winze sunk 150 feet near the 600-foot mark, where a low-grade vein 42 feet wide was found, but with depth the ore increased in value. Lessees have developed the continuation of the Mary McKinney ore shoot on the Colorado Boss claim No. 3, belonging to the Cripple Creek Con. Co., showing that the Mary McKinney ore shoot is the longest developed ore shoot in the entire district. So far the ore shoot has been opened a distance of over 2300 feet.

Rhyolite mountain is to be prospected with a diamond drill by the Metallic Tunnel Co., who intend to drill 1000 feet before driving to the breast of the tunnel.

IDAHO.

BANNOCK COUNTY.

Near Pocatello J. F. Cooney and others

are developing a vein of nickel and cobalt on Terrell creek, which is locally reported to "assay 20% nickel, 10% cobalt and 15% lead."

BLAINE COUNTY.

Manager Rockwell of the Minnie Moore says he has sufficient quantity of ore developed to keep the mill going one year. The mill has a daily capacity of fifty tons.

In the Della Mountain Co.'s Idaho Democrat mines, Watt & Brennan, the owners, began a tunnel last January that was intended to explore the vein to a depth of 1100 feet. This tunnel was driven 580 feet, when it cut the vein. Its course was then changed so as to follow the vein. Since then it has been driven 200 feet in the vein, which averages 5 feet in width and carries silver, lead and gold, being good concentrating ore. When completed the tunnel and drift will be in 2100 feet, and under the first ore chimney.

BOISE COUNTY.

Mr. Ingle found that the ore on the dump at the mines of the Twin Sisters Co., at Centerville, was rich—not in free gold but a telluride. He went to the company and got a bond for \$15,000. When the bond was signed he asked for discount for cash. The company agreed to take \$11,000, which he paid, and is now the owner of the mines. The Idaho City World says that the company that sold to Ingle did not suspect that the ore carried telluride.

CUSTER COUNTY.

G. R. Hancock, in charge of the White Knob copper mine at Mackay, writes to Eureka, Utah, that the miners who accompanied him from there are earning \$3.50 per day for eight hours on machine work, and the same wages for ten hours on hand drills.

IDAHO COUNTY.

(Special Correspondence).—The new camp of Thunder Mountain, which was so extensively boomed by the newspapers, is at present in the doubtful stage of its life as a camp.

Roughly speaking, there is a mountain of porphyry carrying gold throughout, but in small quantities; a few bunches of rich rock have been discovered, but the mines if they materialize will be high low-grade propositions. The properties of the Pittsburg companies have been examined and the reports will determine whether it is advisable to proceed with the development of the mines.

"Thunder Mountain is not a poor man's camp and it was a mistake of the local papers to boom it so much," is a statement made by E. Dewey to me Aug. 1st at Nampa. The distance to the camp from the railroad is nearly 200 miles; and a large portion of this is at present over trails.

The stories of returning prospectors that there is nothing in Thunder Mountain can be set aside. Such tales are told of every mining excitement. The proposition is whether this mass of low-grade ore will pay to mine and mill. The chief difficulty will be the high cost of transportation, and building a wagon road over a very difficult country.

Thunder Mountain is not dead; another year will see either the abandonment of the camp or the active development on a large scale of low-grade ore.

Roosevelt, Aug. 5.

The Silver King G. M. Co., Thunder Mountain, say they will put in a complete electric drill plant, and a steam power plant for their stamp mill.

B. C. Kingsbury, at Elk City, has bonded the Blue Ribbon group. The bond requires that he keep continuously at work on it during one year; he has ten men there now. The Blue Ribbon is free gold and concentrating. A tunnel has exposed a ledge 9 feet wide, running \$9 in gold. Elk City, of course, is an old placer camp, which had 3000 people there forty years ago; most of the placer ground has been worked out.

OWYHEE COUNTY.

The Avalanche reports that in the Lucky Fire mine, near Silver City, the quartz will run \$30 to the ton. As a result of the assays a local company has organized and bought the property. The new corporation is the South Sinker G. M. Co.

SHOSHONE COUNTY.

Since June 1st, the Wild Rose gold mine, at Pierce, has treated 100 tons of ore, which yielded \$8000 from the plates. The property is owned by the Dunn Bros. of Wallace, T. Wilkinson of Kellogg, and M. A. Ellis of Pierce.

H. H. Burns has the lower tunnel of the Snowstorm in 145 feet.

The Black Cloud mill, near Wardner, is now in regular operation.

The Highland Chief mine on Pine creek is bonded by a St. Paul company for \$100,000, 10% down. It is said that all the men that can work to advantage will be put on.

The Highland Chief mine, Pine creek,

is bonded by a St. Paul company for \$100,000-10% down. All the men that can work to advantage will be put on.

WASHINGTON COUNTY.

At Mineral, 23 miles from Weiser, the smelter will have new machinery and equipment. The capacity is 150 tons daily. Ladd & Tilton of Portland, Or., have bought the smelter and several claims in proximity to it. G. M. McDowell is superintendent and general manager of the smelter and mines.

L. M. Morton and J. Knight of Pendleton, Or., will organize to develop the Morton copper mine near Mineral.

MISSOURI.

JASPER COUNTY.

St. Louis reports that the lead combine, discussed in the issue of the 2nd Inst., is now nearing its consummation. While its promoters are more than ordinarily reticent, it is definitely known that the scope of the merger will include most of the white lead plants east of the Mississippi river, the principal pipe and sheet lead plants, a number of sheet and company manufacturing products in which lead forms one of the chief components. Included in the merger will be the Union Lead & Oil Co., which was organized last year by the Ryan-Whitney coterie of capitalists, with a capital of \$10,000,000, and which controls the Bailey process of manufacturing white lead. Overtures made to induce the National Lead Co. to join the merger are said to be favorably looked upon by a portion of the directorate. Behind the merger are the Ryan-Whitney and American Smelting & Refining Co. interests. Options have been secured on a number of corroding plants of the country, notably the Chadwick Co. of Boston, Mass., and the Raymond Co. of Chicago, Ill. If the merger is completed successfully, it will control the lead manufacturing interests of the country and indirectly, through its alliances, the pig lead market. The plans of the promoters favor a corporation with a capitalization of not less than \$50,000,000. The papers will probably be filed in New Jersey during the next sixty days, although definite announcement of the status of the merger is looked for before the expiration of that time. The lead producing properties in southeastern Missouri, Colorado and the Cœur d'Alenes will not be included in this merger, but will be the basis of a second corporation with a capitalization of not less than \$25,000,000, to be consummated after the manufacturing merger has been effected.

MONTANA.

CASCADE COUNTY.

At Great Falls, E. B. Braden says there is but slight hope of early resumption of operations at the old silver smelter. Mr. Braden was United States assayer and is now manager of the East Helena smelter and in charge of the business at the American S. & R. Co. in the Northwest. "Primarily, of course," he continued, "the cause of the close-down of the smelter is the failure of the mines at Barker and Neihart to come up to expectations. If these mines were making the output expected when the railroad was built to them, the smelter would be in operation. Whether Canadian ores from the East Kootenai country could be brought over the Great Falls & Canada will depend upon what arrangements can be made with the Canadian Pacific road, and also upon the London market for lead. Present conditions are none too hopeful that such ores can be handled. Two years ago lead on the London market was quoted at £18 per ton of 2250 pounds. Now it is down to £11, or about \$2.14 per hundredweight in United States money. The smelter here is also expensive to operate and is remote from such class of ores, fluxing ores, as are necessary for cheap commercial smelting. It is idle to talk of bringing Cœur d'Alene ores here. The Northern Pacific would prevent anything like that. Everything at the East Helena plant is running nicely now. The men are all back at work and we will blow in the third furnace. I have not heard authoritatively as to the resumption of work at the Frisco mine in Gem, Idaho, where a number of Montana people have interests, but there are reports that the mine will resume. The output from the Cœur d'Alene mines this year will be about 25% higher than for the year ended July 1st last. This decision to increase the output one-fourth is the result of an agreement between the mine owners and the smelter, our interests being identical respecting a market for the product."

DEER LODGE COUNTY.

The injunction granted by Judge Harnay on the Speculator mine, in the case of Lee Mantle against the Speculator M. Co., was served on the 9th on Superintendent Wishon and the mine closed. The Standard says: "About 285 men were laid off

to join the 400 thrown out of employment by the Minnie Healey injunction."

At Gold creek, on which the town of Pioneer is built, L. U. Loomis, manager Gladstone G. M. Co., will have a 25-ton cyaniding plant and stamp mill.

DALY COUNTY.

The report of the Anaconda M. Co., which operates the Anaconda, St. Lawrence, Never Sweat, Mountain Con., Green Mountain, Bell and High Ore, shows for the year:

Ore mined, tons.....	984,958
Gross value per ton.....	10 68
Cost per ton mining.....	3 80
Total paid for mining.....	3,742,312 20
Cost of transportation per ton to Anaconda.....	15
Total cost of transportation.....	147,743 70
Cost per ton reduction.....	3 32
Total cost reduction.....	3,267,182 32
Paid for labor.....	3,860,789 41
Paid for machinery.....	3,148,705 11
Paid for freight.....	147,743 77
Marketing, seaboard costs, refining and selling.....	2,052,105 58
Total net proceeds for year.....	1,289,610 02

From the above statements it can be seen that mining, transportation and treatment of the ore cost \$7.27 per ton; there was a charge of about \$2.15 for marketing the product, refining and charges other than smelting.

FERGUSON COUNTY.

At Lewistown the New Year mines have seventy-five men employed in the mill and mines.

Surface water in Ruby gulch has put a stop to nearly all work in that district.

Yogo reports that G. Hall has a vein of ore carrying values in silver and gold.

GRANITE COUNTY.

T. W. Barnes and A. Mathez, president and consulting engineer Dorothy G. M. Co., are at Phillipsburg to arrange for building a quartz mill 4 miles northeast of Granite.

The clean-up at the Syndicate mines, in Basin gulch, is finished. The ditch which carries the water from the head of the west fork of Rock creek is 14 miles long. Difficulty is experienced by seepage of water through slate rock along its course. These flumes have been built where there was considerable loss of water. Near the head G. Ammerman has men tapping a lake, driving an open cut to divert the water from the lake into the ditch, to insure constant supply.

JEFFERSON COUNTY.

Three miles from Boulder, W. K. Mallette will superintend development of a group of mining claims. S. Myhre has put the property in shape by unwatering and timbering.

LEWIS AND CLARKE COUNTY.

(Special Correspondence).—The Big Indian, on Big Indian gulch, is to be worked again. In 1891 Winscott Bros. operated a 10-stamp mill on the ores of this mine. The mine has been worked as an open quarry, over 200 feet in width. The owners sold the mines a few months ago to A. C. Mason of Tacoma and associates, who will build a 60-stamp mill of 850 pounds each, operated by electric power from M. R. P. Co., at Canyon Ferry on the Missouri river, 16 miles northeast of here. The power will be delivered to two motors located in the mill, each of which will independently furnish power to operate thirty stamps. The mill and improvements were designed by C. McIntosh, who is superintending its construction.

Six or seven miles easterly of the Big Indian mines are the Bonanza Chief and Overland mines. The Bonanza Chief vein has been crosscut 225 feet between walls. These mines closed because the owners lack the capital to operate them.

Two miles east of the Overland there is a dyke of porphyry lying between the lime and granite, known as the Gold Hill. It is over 100 feet in width and so thoroughly mineralized that every pan of crude ore will show colors in panning. It is interlaced with streaks of siliceous ore, a quantity of which has been milled, yielding from \$3 to \$72 per ton in gold. Every gulch and bar below this gold belt, as it crosses McClellan and Mitchell gulches, contains placer gold.

Helena, Aug. 9.

An express carload of cyanide product worth \$30,000 was recently shipped from the Drum Lummon cyanide plant at Marysville to an Eastern refinery. The cyanide plant has a capacity of 400 tons of tailings per day. The plant is on Silver creek, 3 miles from Marysville. It is treating the tailings from the Drum Lummon mine—the accumulation of the long milling operations of the company—and fill the bed of Silver creek for 5 or 6 miles below the 110-stamp mills belonging to this company at Marysville. The company owns the entire gulch and has enough tailings to continue the operation of the plant for years. The annual report

of the company shows that the profits made from the tailings are greater than from the mills.

MADISON COUNTY.

The Watseka assay office at Rochester was totally destroyed by fire last week. Of the contents the scales alone were saved.

SILVER BOW COUNTY.

The Minnie Healy mine has shut down on orders from the Supreme Court, which refused to grant a rehearing or stay in the injunction. The Boston & Montana furnished a bond for \$300,000, as required by the court, for the purpose of indemnifying Heinze. About 400 men are thrown out of employment.

NEVADA.

ELKO COUNTY.

The Dexter Co., Tuscarora, in June turned out in gold bullion and cyanides \$15,200; during July, \$15,300.

HUMBOLDT COUNTY.

C. L. Taylor, returning from his Granite Point borax plant, on the extreme southwestern edge of the Black Rock desert, heard of the discovery made in the range of mountains across the desert to the northwest, went there and found everything had been located before he arrived. He confirms the report of the richness of the ore, which assays from \$60 up, but says the ledge is only about 1 foot in width, and not enough development work has been done to determine to a certainty the extent or value of the discovery. It is very promising, but the situation is not such as to warrant a rush to the new district at present. The country has not been prospected to any extent, however, and it is probable that other discoveries will be made. The nearest railroad point to the strike is Amdeee, Cal., on the Nevada, California & Oregon Railroad, about 125 miles from there, across a rough country.

The Sheba G. & S. M. Co. have assays from recent samples showing 804 ounces silver and \$6 gold per ton. The Sheba tunnel is in 639 feet. Milling ore is being taken out to pay expenses and high grade is steadily sacked.

LINCOLN COUNTY.

The Quartette Co., at Searchlight, will sink the main incline shaft to a depth of 750 feet; its present depth is 450 feet. As there is considerable water in the mine, a pumping plant will be put in.

Nevada Keystone M. Co. has incorporated at Pioche.

LYON COUNTY.

Silver City reports a mining deal under way whereby the Quinn mine is to be sold for \$40,000.

Repairs to the Pollard mill in Silver City are completed; the mill is crushing ore from the Silver Hill mine.

The mining suit of F. Golden vs. Murphy et al., involving question of apex and other rights to mineral ground, and damages amounting to \$5000 for ore alleged to have been taken from the Canyon claim, is won by defendants.

NYE COUNTY.

J. E. Durkee, president Consolidated Mines Co., Hawthorne, says his company will put \$750,000 into a mill, cyanide plant, water works and electric plant in Tonopah mines. He says work will be commenced immediately. His company will put a pipe line from Twin river, conveying water 65 miles, into Tonopah, and put in an electric plant to transmit power.

At Tonopah water is now 3 cents a gallon to every body. Before large consumers paid 2½ cents. About ten wagons are in the business. The Tonopah Co. has its own wagons. Two trips a day are made to the wells 4 miles away. From 350 to 600 gallons are hauled at a load.

A contract has been let by the Tonopah Co. on the three-compartment (Siebert) shaft to sink 100 feet, at \$25 per foot, the company to do the hoisting, furnish timber, powder, etc. If the work is done in thirty days the miners will receive \$5 per day, otherwise \$4.50 per day.

At Tonopah, on the 3rd inst., Lynch & O'Meara gave up their lease on the Mizpah ledge, letting out 180 men. It is reported that they have been clearing \$12,000 each twenty-four hours. They had reached a depth of 300 feet. The ledge is stated to be 7 feet wide where they quit and better than \$400 per ton—two-thirds silver and one-third gold. It is said they were paid an additional \$200,000 to give up the lease, which did not expire until next month. This is stated by J. A. Yerington. He also says that \$750,000 is paid at New York, to be invested in the company's pipe line, from Twin river to Tonopah, 65 miles. They expect to let contracts next month. He thinks it is the only instance in the history of the State when three-quarters of a million had been put up at one time for investment. He estimates that it will take eight months to com-

plete the pipe line, and thinks water will be running into Tonopah next May.

Twenty miles from Tonopah and 12 miles from Silver Peak is the new district of Weepah, where the ore occurs between lime and schist. There are three ledges in the Weepah group, from 8 to 20 feet in width, and they carry free-milling gold. C. D. Van Duzer has returned from Philadelphia, Pa., and says the company will expend \$400,000 by next June. The company now has twenty-five men at work and will increase its force. The first payment of \$40,000 is due Sept. 11. G. F. Hensel of Philadelphia, Pa., is at Tonopah to make a consolidation of eighteen claims, and then form a company. It is believed the Tonopah ledge runs through that ground.

The \$1,000,000 to build the Tonopah water works has been subscribed. Tonopah citizens deny the existence of any epidemic or pest there.

Lone Mountain M. Co. has incorporated at Tonopah; branch office in Chicago, Ill.

Tonopah G. M. Co. has incorporated at Tonopah.

There are now employed in the mines Tonopah proper 400 men. Besides, fifty are at work in Klondike, twenty in Liberty, twenty-five in Ray, twelve at Gold Hill and forty at Weepah.

W. H. H. Rhodes, one of the owners of the recently discovered deposit of nitrate of potash and soda near Duckwater, says that the development work recently done on the property was not satisfactory, and that it has been decided to discontinue work.

The Tonopah Eclipse M. Co. has been incorporated by A. L. Dowler, W. Kolman, C. J. Hasman, J. D. Feldman Jr., M. F. Smith.

STOREY COUNTY.

An addition of five stamps to the battery at Fisher's mill, in Six Mile canyon, near Virginia City, is being planned.

Five carloads of the Reider pumping machinery for the C. & C. shaft have been delivered on the Comstock, and five carloads more are in transit. L. M. Hall of the Pumping Association says that the plant will be installed by the middle of October, and that the electric hoist will then be substituted for steam.

At the Savage mine, on the 425 level (from the Gould & Curry tunnel), the past week was occupied in putting in a waste chute in the upraise from the north drift from No. 2 east crosscut.

WASHOE COUNTY.

There are said to be over 300 men now at Donnelly mountain, the new mining camp in the northern end of the county.

Nevada Bell Con. M. & R. Co. has incorporated at Reno.

WHITE PINE COUNTY.

Manager J. A. Yerington of the McKinley mines, Ely, says an additional hoisting plant will be installed and a reduction plant for converting the ore.

NEW MEXICO.

GRANT COUNTY.

The recent purchase of the Hanover group of iron mines near Silver City by Phelps, Dodge & Co. starts a report of their proposed erection of a smelting plant at Deming, which would be encouraging news for many of the small mining properties surrounding Deming for 100 miles, which as a rule are known as siliceous ores that will not stand shipment to El Paso.

SANTA FE COUNTY.

At Cerillos the Con. M. & S. Co. is making a final survey for a railroad from the smelter to the properties 4 miles distant. The line will require 12 miles of track and will cost \$30,000. The company is laying the foundation for a concentrating plant which is expected to be completed Jan. 1. The company miners are working the Tom Paine.

The Gibson Dev. Co. has had men constantly at work for more than a year prospecting and developing the Erie and Buckeye groups. Some high-grade silver-lead ore has been taken out in doing such work. On another of their groups, the Dreamer, they have one shaft 160 feet down, and another 55 feet. The ore is chloride in character and carries 100 ounces silver. The Bottom Dollar, Nick of Time, Humming Bird, Aztec, Hondo, No. 4 and other properties are working full force with a view of being able to supply ore to the smelter and concentrating plants.

There are 200 individual owners of claims in the Cerillos district who for many years have kept up their assessment work and who expect to share in the benefits to be derived from present improvements and development.

OREGON.

BAKER COUNTY.

At Sumpter Everett Brown, manager California and Cracker-Oregon mines, has a 10-stamp mill on the Cracker-Oregon

and concentrating plant on the California. A strike is reported made in the Little Emma mine, Virtue district, 6 miles from Baker City, 200 feet below the surface, 550 feet in the tunnel. It is a 5-foot ledge; ore averages \$15. All the ore is free milling. The property is owned by W. L. Vinson.

Near Sumpter, General Manager J. H. Pomeroy, on John Day river, has given his dredger a preliminary run. It cost \$130,000, the first plant of the kind to be erected on the John Day side of the Blue mountains, the second in eastern Oregon. The capacity of the dredger is theoretically 2000 cubic yards, although in making general averages, which must include necessary stops, the daily capacity is reduced. A large placer area is owned by the company, which will be worked.

Near Sumpter, J. K. Fawcett of the Payco, has bought the Little Giant mill machinery and building to haul it to his Greenhorn mine.

A. Baring of London, owner of the North Pole, was in Sumpter last week on a visit to the mine.

Manager McPhoe of the Golden Wizard is unwatering. Sinking will be continued.

The Black Pine placer mine is on East Ten Cent creek, 3 miles from Lawton; has 1400 feet of pressure pipe, two dams and other equipment. A survey is being made for a ditch to increase the present force of 100 inches to 300, with a better head; 2½ miles in length, by 50 to 100 feet wide, is available for work. On this the gravel bed is between 8 and 15 feet.

A preliminary run of the big dredger on the John Day was made during the week to test the machinery. The run was short and resulted in revealing few weaknesses.

T. H. Barbee of the Crown Point is installing a three-drill air compressor.

JACKSON COUNTY.

At the Sterling placer mine two giants are operated; twenty-five men have been employed but hydraulic mining will probably be suspended next week for the clean-up. A strip of conglomerate about 20 feet wide next to the bedrock, parallel with the old channel and near the center, requires blasting before the monitors are turned on it. After a cannonade of dynamite cartridges on this cement bed, the streams of water do the remainder of the work effectively.

Robert Bond, near Jacksonville, has developed by tunnel levels ground favoring that kind of exploration. A 5-stamp mill is in operation on the property.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The stamp mill of the Boston-South Dakota M. Co., in Blacktail gulch, is in operation. It has forty stamps; twenty of them are running at present. The ore is a conglomerate, carrying from \$3 to \$5 a ton in free gold and about the same amount in concentrates. The company will add concentrating machinery. T. Corkhill is superintendent.

In the vicinity of Roubaux, formerly Perry, companies are working and more men drawing salaries than ever before. The Clover Leaf M. Co. is running thirty stamps on the Uncle Sam and before the year closes will have sixty stamps dropping. The company is building a flume to take water out of Elk creek. The Anaconda M. Co. is sinking a shaft on the Nelson ground and will crosscut to the east.

PENNINGTON COUNTY.

Keystone thinks it is probable that the mill of the Holy Terror Co. will have some more of its stamps in operation next month. It is asserted that the other fifteen are soon to be let down, and the ten stamps of the Holy Terror mill may also be started before long. The company has been blocking out a large amount of ore lately, and it is showing an excellent grade. There are experiments still under way with a view to ascertaining the best method of treating the tailings of the mill.

The Tycoon M. Co. is continuing the tunnel designed to make it more convenient to convey ore from the mine to the stamp mill. Regular clean-ups are being made at the 10-stamp mill.

The Horseshoe M. Co. may buy the National smelter at Rapid City. If it goes the cyanide plant may not be built, although the Horseshoe people would continue the present cyanide mill at Pluma, by enlarging it to 200 tons capacity. The Rapid City smelter has an ore capacity of 300 tons per day.

YANKTON COUNTY.

(Special Correspondence).—The Hidden Fortune M. Co. reports that they have opened a body of ore in the 120-foot crosscut. They have not yet struck the foot-wall. The ore will average \$6 per ton.

Gayville, Aug. 8.

UTAH.

BEAVER COUNTY.

The Beaver Con. M. Co. has incorpo-

rated at Milford; J. J. Trenam, president; J. J. Corum, vice-president; E. H. Jacobs, treasurer; B. L. Corum, secretary.

JUAB COUNTY.

At Eureka Superintendent Bridges of the St. Louis-Eureka M. Co. has a lease and bond upon the old West Cable ground which adjoins his company on the north. It is his intention to run a drift from the 550-foot level of the West Cable into his company's territory, giving a depth of 750 feet. The amount of the lease and bond is said to be \$20,000, the lease running five years.

Resumption of work at the Centennial-Eureka mine, Eureka, is projected. It is the local belief that the entire force of 200 men will be re-employed.

The Eureka Hill M. Co. now employs forty miners.

Superintendent J. C. Sullivan has the shaft of the Raymond M. Co. down 1100 feet and says that the work of sinking will be continued, possibly until a depth of 2000 feet has been attained. When the 1300 level is reached drifting will be commenced.

PIUTE COUNTY.

Manager Rader of the Annie Laurie mines and mill at Gold Mountain, Kimberly, expects to tap the gold-bearing channel at a vertical depth of 460 feet below the avenue above, penetrating the zone a distance of 3000 feet.

SALT LAKE COUNTY.

Thornton & Lloyd have a \$15,000 option and a year's time on the Ravine group at Alta, adjoining the Centennial Emma.

SUMMIT COUNTY.

Manager A. H. Mayne of the Minola properties, Park City, expects that the main contact will be reached at a depth of 130 feet below the tunnel level. The Minola Co.'s territory stretches along the zone north of the Silver King, embracing 157 acres.

TOOELE COUNTY.

The cyanide plants of Mercur, Utah, have treated ores profitably which ran as low as \$2.80 per ton, when handled in large tonnages. The bulk of those ores have thus far been of the oxidized class, composed of siliceous lime, clays, shales, porphyry and talc, which offered little obstacle to cyanide work when leached in coarse particles. At greater depth a portion of the ore contains such base elements as arsenic and antimony, which requires roasting before leaching. In the vernacular of that camp the first class named, which requires no roasting, is called "free milling."

WASHINGTON COUNTY.

Grant Snyder, manager of the Dixie at St. George, has on the 625-foot level a width of 40 feet, ore going from 17% to 20% copper. The main shaft is down 675 feet. A 10-mile road between the mines and the site for the new smelter has been completed.

WASHINGTON.

DOUGLAS COUNTY.

The Columbia Tram Co. proposes to construct and operate a 2-mile aerial tramway on the Columbia river, near Waterville.

FERRY COUNTY.

At the Mountain Lion mill, near Republic, in six months, 11,959 tons gave a gross value, \$129,127.07; average value per ton, \$10.80; highest value in gold, \$12.39; highest value in silver, \$1.87; lowest value in gold, \$7.49; lowest value in silver, \$1.38; milling cost per ton, \$3.73; average saving of Mountain Lion mill, 54.9%; highest percentage, 61.9; lowest percentage, 39.

The Ohio G. M. Co. incorporated last week in Spokane to operate an extension of the Tom Thumb at Republic.

OKANOGAN COUNTY.

Near Loomis, after a temporary shut down of three weeks, the power drills at the Six Eagles mine are driving at a rate of 3 feet per day the tunnel to cut the ledges on the several claims of the group.

The Co-operative Mining Syndicate of Elma will increase their force and drive a working tunnel. J. Kent will superintend the work.

STEVENS COUNTY.

The Old Dominion M. & M. Co.'s property near Colville is leased for three years to W. F. Kyle of Minneapolis, Minn. The ore contains chlorite and bromide of silver, galena, staphanite and fahlerz, with gangue of mixed quartz and lime. The total work on combined properties is 11,625 feet. The vertical depth of the tunnel now in 3000 feet is about 800 feet, and on the incline of the ore plane 1200 feet. C. G. Carruthers is superintendent and expects to begin active work about September 1.

YAKIMA COUNTY.

Near North Yakima, the Elizabeth G. H. M. Co. reports a vein measuring 7½ feet, on ore that assays \$147 in gold, silver and copper per ton. Twelve men are at

work opening the State road to the district. The mines are 70 miles from North Yakima and 20 miles from a wagon road.

WYOMING.

CARBON COUNTY.

Near Grand Encampment, the Grand Republic M. Co. are at work on their claims. S. Fields, formerly foreman Grand Encampment Smelter, is superintendent.

Grand Encampment reports that the sunken cavern, known as the Princess copper mine, has been sold to C. Fishback of Rawlins. The ore goes \$11 gold to the ton and some copper.

At Grand Encampment the North American Copper Co., which recently bought a number of mines in that section and which proposes to build railroads, electric light plant, etc., has commenced work on the 1000 H. P. electrical plant. A camp has been established 3 miles up the south fork of the Encampment river, and men are building a wagon road to a point 4 miles from Encampment, where a dam will be constructed. Water will be piped to the smelting plant and concentrator. The dam will be 33 feet high.

FOREIGN.

BRITISH COLUMBIA.

The Mines Exchange, Ltd., Nelson, reports that Fish Creek, on the Lardeau, at present is the liveliest camp in the district. The Camborne group is owned by the Northwestern Development Syndicate, Ltd., the Eva group by the Imperial Development Syndicate, Ltd., and the Oyster group by Messrs. Poole & Young and associates. On the Camborne group the company have an electric power plant and three electric drills are used to develop the property. The company is furnishing electric lights for the camp and mine workings, wires being connected with the townsite of Goldfields. It is the intention to operate an electric car line for passengers and freight between Comaplix, the head of navigation on Arrow lake for the camp, and Goldfields. Machinery for a 10-stamp mill and 5000 feet aerial tram has been shipped. A shipment of twelve tons made to the Granite mill, 5 miles west of Nelson, gave results as follows:

Feeder sample assayed, per ton.	\$ 44.00
Recov'd by amalgamation, per ton.	33.07
Recov'd by concentration, per ton.	1.80
Value of concentrates	207.20
Gold bullion recovered, ounces.	25.65
Percentage of total values saved by amalgamation.	82.7
Percentage of total values saved by concentration.	4.7
Total recovery, per cent.	87.4

Development work on the Camborne is under the superintendence of H. Z. Brock.

On the Eva group development has been carried on for two years, resulting in over 2000 feet of underground workings. The lead is from 100 to 150 feet wide. The ore shoots occur on either wall, with numerous cross fissures from wall to wall, which carry ore.

The Wide West, Beatrice and Iron Dollar groups, in this district, are being opened up. The formation throughout is a mica schist, with frequent intrusions of porphyry dikes.

Because of the adoption of oil for fuel in California the demand for coal from the Nanaimo mines has fallen to a low figure. Up to this year there has been a large fleet employed in the transportation of coal from British Columbia to San Francisco, but this has of late been decreasing. The New Vancouver Coal Co. at Nanaimo announces that the mines will be shut down and frankly advises the men to look for other employment.

At Rossland the main shaft of the Le Roi mine is to be sunk to the 1400-foot level.

H. B. Jackson, manager Contact mines, proposes to put in extensive machinery.

A. G. King will put in a concentrating plant at the Bird mine, Deer Park.

J. C. Ryan of Kaslo, who has been working and managing the Soho group, says that the property will from now on be operated by the Soho M. Con. Co., and that extensive work will be begun. It is the intention of the management to put in a \$12,000 compressor plant. The ore is silver-lead.

The Second Relief mine, Ymir, has started its mill and is daily treating thirty tons of ore, average value \$11. The plant was run several months ago, but it was found that the tailings carried away \$4.50 per ton. A cyanide plant was built in connection with the stamp mill and it is expected to save 80% of the gold in the tailings at a cost of 76 cents per ton. The mill and the mine together employ about thirty men; F. Nettleton superintendent.

MEXICO.

CHIHUAHUA.

A gasoline locomotive goes to a mine at Batopilas, 180 miles from the Mexican

Central Railway across the Chihuahuas mountains. None of its parts weigh more than 250 pounds, as the whole engine has to be carried from the railway to its destination on the backs of burros. It will run in a tunnel 5 feet wide and 6 feet high, and will take the place of sixty burros, which now pull the cars of ore from the mine. As the tunnel is small and its length great, the locomotive had to be constructed so that no fumes escaped. To accomplish this, the carbonic oxide gas is passed through scrubbers at a gas works. It is claimed that the process will effectively prevent fumes from escaping into the tunnel and that the combustion will be perfect.

The Rosario mine, at Guadalupe y Calvo, is sold to Montana men; the price is said to be \$1,000,000. A. W. Warwick of Denver, Colo., is examining the property.

SONORA.

A group of copper mines in Sonora have been acquired by S. M. McCowan, W. C. Foster and W. E. Defty of Prescott and J. Henderson of Nogales, Ariz. The property is known as La Gran Providora de Cebra. The company will begin operations Sept. 1.

NEW ZEALAND.

There is a mill containing 330 stamps on the Waihi, its crushing equipment being third in size on earth, being next after the Homestake Co. of South Dakota, and the Treadwell property of Alaska. The Waihi has been in operation fifteen years and to May of this year had produced \$10,663,350 in gold. The deepest workings are 643 feet. A recent estimate of the ore in sight placed the total at 628,595 tons. Last year 290 stamps crushed 159,325 tons ore.

NICARAGUA.

W. M. Bluett has returned to California after eleven years' residence on the Mosquito coast, Nicaragua, near Bluefields. With his partner, J. B. Smith of South Dakota, he has several ledges, one 33 feet, another 16 feet, another one 18 feet. On one of these ledges in thirty days with the Huntington 3-foot mill he says they took out 1000 ounces of gold. The 60-foot ledge will average from \$10 to \$12 a ton. They have ample water power and are preparing to put in a 20-stamp quartz mill. The mineral wealth of that country, Mr. Bluett tells the Oakland Enquirer, lies in the large porphyry belts with big leads. The principal capital invested in the development of mines there is local—being that of business men and merchants of the coast, very little outside capital being put into the country. The local business men find that it is a paying investment and that there is a double advantage in the business which the mines afford to the coast towns. The officers of the mining companies receive salaries ranging from \$150 to \$200 a month, but most of the labor is done by peons, who receive \$2 native money and board. This means that their wages are about 50 cents of United States coin, and it costs from 25 to 30 cents native money to feed them. The mine in which Mr. Bluett is interested employs from twenty-five to thirty men regularly. Most of the supplies for the men come from New Orleans and New York, although a large portion of what is consumed is produced on the plantations adjacent to the mines. The climate is equitable and healthful, Mr. Bluett stating that in the eleven years of his residence there he has not been sick more than four days. The water is good and the heat is not such as to interfere with ordinary pursuits. The political disturbances of the country have little effect upon the progress of mining, and there has been no interruption by reason of the unsettled state of affairs at any time since Mr. Bluett has resided in Nicaragua. Mr. Bluett expects to return to Nicaragua when the new plant at the Lone Star mine will have been completed.

PERU.

F. Klepetko, late of Butte, Mont., has taken charge of the New York office of the company that proposes to make Peruvian copper a prominent factor in the world's copper production. Engineers are now laying out a line for the extension of the Oroya Railway to Cerro de Pasco. The money is being furnished by J. B. Haggin of New York and associates. Three millions of dollars already have been expended in buying up claims, and the Americans now own four-fifths of the entire region. The railroad from Oroya to the mines will cover a distance of 80 miles, and will cost about \$2,000,000. The mines of Cerro de Pasco have been famous as silver, but not as copper producers, for more than two centuries and a half. The official records account for an annual average output of 1,600,000 ounces, making the quantity up to the present time 435,200,000 ounces. For years copper has been known to exist in the Cerro de Pasco district. The miners were con-

tinually coming across it in the course of their extensive workings, and it was considered by them as the only great drawback to the region. In 1899 the attention of Europeans was attracted to the possibility of the Cerro de Pasco district, and T. A. Bennett, an English mining engineer, was sent to Peru to make an examination of the property for the London Exploration Co., Werner, Beit & Co. Mr. Bennett made a thorough examination of the whole district, and based his report upon the conviction that the Cerro de Pasco is the greatest single deposit of copper known. J. B. Haggin, who has been for many years largely interested in copper and copper mines, having had the Cerro de Pasco region brought to his attention, sent A. W. McCune and J. MacFarlane from Salt Lake, both of whom had been associated with him, to Peru, to visit the Cerro de Pasco mines and report to him thereon. They did so, and he was so well pleased with the possibilities described by them that he determined to purchase the properties. Mr. McCune came to Peru to negotiate the purchase of the properties. He and Mr. MacFarlane resided in Lima in July of last year and immediately began buying up the properties in the Cerro de Pasco region. Between 200 and 300 claims have come into the possession of Mr. Haggin, representing about four-fifths of the copper-bearing belt. The claim in Peru under the old Spanish law was 60 by 30 varas (a vara being 33 inches). The ore deposits or veins are about 2 miles long, and from about 1 mile of this ore has been taken and shipped. Having secured the mines, Mr. Haggin's representatives began negotiations with Mr. Thorndike for his railroad concession, and this was secured only a short time ago. The railroad is to be 4 feet 3½ inch gauge, will run northward, passing over the summit of one of the ridges of the Andes at an elevation of 14,300 feet. No great difficulties, it is asserted, will be encountered in building the road. Two small pieces will be 3% grade, but the average grade will be 1½%. The Oroya Railroad leaves the port of Callao at 9 feet above sea level, and at a distance of 106 kilos surmounts an elevation of 15,665 feet.

SOUTH AFRICA.

Consular Agent W. D. Gordon of Johannesburg, under date of June 28, writes that he has been asked to secure data in regard to drilling outfits, suitable for prospecting alluvial wash at a depth of 25 to 30 feet, and a core 6 inches or more in diameter is desired.

Johannesburg believes that there is a continuation of the main reef of the Witwatersrand gold field 35 miles on a line south by east of the Nigel mine to a point near Greylingstad. The Coronation Syndicate has secured the area. Prospecting parties are now engaged at different points.

W. S. Caine, Member of Parliament, London, S. W., England, writes in reply to a letter from W. H. Cowling of Gilpin county, Colorado, asking for information concerning privileges and restrictions granted and demanded from all parties intending to go to South Africa, to work in the mines at that place. For some time past no one was allowed a permit to go to that part of the country until they possessed £100, so that in case they were unable to get work they would not be a charge on the Government, and as so many men were going to that country looking for work, who had barely enough money to land them, some restrictions had to be made, which resulted in an order being issued that no permits would be granted unless it was shown that the applicant had the amount of money required. Mr. Caine says: "That I might be quite sure that I had the latest information, I went to the South African permit office and saw the chief, showing him your letter. The £100 is quite unnecessary now, and if you can show proper evidence that you have been engaged by the Crown Reef Gold Mines, or any other, you will have no difficulty in proceeding to South Africa. But for some time to come no permits whatever will be given to persons who are simply going out to look for work, unless they can produce £100. There is no need for you to come to England to get the permit. They are now given by the British Consul at New York and the British Consul at San Francisco. All you need do is to send the letter informing you of your engagement in South Africa to the New York Consul, making formal application for a permit. He will then send you a permit, and if you can get a steamer you can proceed direct to the Cape from New York or any other port in the States. If, however, you intend to go to South Africa via this country, and are coming home to see your people before going out, I should advise you to get your permit here, as it will be simpler and easier."

The total gold output of the Transvaal mines for July, 1902, was 155,000 ounces,

an increase of 129,041 ounces over the same month last year. From January 1 to July 31, 1902, the total output is returned at 811,842 ounces, against 53,216 ounces in the first six months of 1901, 251,801 ounces in the same months of 1900 and 3,042,339 ounces in the first half of 1899.

THE KLONDIKE.

Dawson to the 11th inst. reports that what is calculated as the best discovery of gold since the days of the El Dorado, was recorded that day on a tributary to Sixty-mile river, 30 miles back from the Yukon. War is on between the up river boats, and the lowest rates for the year are now announced, \$20 first class and \$10 second class, to White Horse. Over \$750,000 in bullion left there last week. The total shipments for the present season since the opening of navigation, as taken from the comptroller's books, is \$6,500,000. This is the first exact report given by the comptroller.

A fire at Forty Mile, August 5, nearly wiped out the town. The entire set of warehouses of the N. A. T. & T. Co. were destroyed. Loss \$40,000.

Personal.

FRANZ CAZIN of Denver, Colo., is in Rossland, B. C.

G. TETRO is superintendent Albion mine, Alta, Utah.

J. B. MAYO is manager Old Reliable M. Co., Golden, N. M.

STUART EDGAR is manager North Fork M. Co., Lake, Wyo.

V. M. CLEMENT has returned to Salt Lake, Utah, from Mexico.

G. W. CRAWFORD is manager Pride M. Co., Montezuma, Colorado.

DON MAGUIRE of Utah is examining California mining property.

A. B. LEWIS is general manager Majestic M. Co., Milford, Utah.

FRANK LEONARD of Alma is examining mines in Boulder county, Colo.

W. C. WRISBERG is manager Bon Homme mine, Lake City, Colo.

R. B. SYMINGTON is examining mining properties at Whatcom, Wash.

A. H. BROWN, manager Trinity, Cal., Copper Co., is in San Francisco.

H. A. KELLER has returned to San Francisco from Valdez, Alaska.

W. H. RADFORD has returned to San Francisco from Cripple Creek, Colo.

CURTIS H. LINDLEY has returned to San Francisco from Grass Valley, Cal.

W. C. HOWARD is superintendent Golden Eagle mine, Hayden Hill, Cal.

F. J. SOLINSKY has been elected president Houghton G. M. Co., Altaville, Cal.

W. C. MOSHER of Denver is in Park county, Colo., looking after mining interests.

GEO. B. ST. CLAIR is superintendent the New Philadelphia Co., Georgetown, Colo.

JAMES MCKINTY, foreman Con. Virginia mine, Virginia, Nev., is in San Francisco.

C. W. GOODALE is announced in Montana as probable superintendent Washoe smelter.

WILLIAM GWYNN of Mexico is doing placer mining at Breckenridge, Colo., this summer.

H. A. SUMNER has been appointed chief engineer Denver, Northwestern & Pacific Railroad.

CHAS. GRACY of Arizona is examining mining property near Pioneer, Amador county, Cal.

E. EVERSON is superintendent D. U. Jones mine, Quartz Valley, Siskiyou county, Cal.

E. KEINZLE is superintendent of the Dunkirk G. & S. M. Co., Slate creek, Prescott, Ariz.

NEWTON DUNYON has been appointed assistant superintendent of the Daly-West, Park City, Utah.

G. M. HYAMS is announced as the new manager Amalgamated Copper properties, Butte, Mont.

G. W. INGALLS is at the Ferry Building, San Francisco, in charge of the Nevada mining exhibit.

H. C. BRIGHAM is now superintending the Keystone placer operations, San Miguel county, Colo.

F. L. BOSQUI, late superintendent of the Smuggler-Union Co., Telluride, Colo., is now at Ross, Mont.

A. N. BUTTS, a mining man of Angels, Cal., is examining mining property in the San Juan country, Colo.

J. M. MORRISON, manager of the Richfield M. Co., has returned to Ures, Mexico, from Washington, D. C.

C. M. FUELLER, of Denver, Colo., is

taking a trip through South Dakota, and also Chicago and Milwaukee.

PAUL LIPPENS, a Belgian mining engineer, is visiting California mining properties on a tour of observation.

W. A. CLARK is in San Francisco. He will visit the mines at Jerome, Ariz., and return to Butte, Mont., Oct. 1.

F. M. DOWNER of Longmont is now superintendent of Denver mint and J. M. Milson of Canyon City, melter.

GENERAL MANAGER E. V. ORFORD of the De Lamar mines, De Lamar, Idaho, has returned there from Silver City.

THE Crown Prince of Siam will make a tour of all Western metal mines of this country next October and November.

C. H. WHITE, professor geology and mineralogy of Yale College, is at Mercur, Utah, to investigate cyaniding work.

R. R. LESLIE, late shift boss, is now superintendent Le Roi mine, Rossland, B. C., F. Whitman underground foreman.

T. J. HOOVER, late assayer Keystone mine, Amador Co., Cal., has opened a mining engineer's office at San Francisco.

N. C. BANKS of Pittsburg, Pa., who has charge of the mining department of the Westinghouse Co., is in Salt Lake City, Utah.

S. H. C. MINER, J. P. GRAVES AND A. C. FLUMERFELT of the Granby M. & S. Co. are inspecting Republic, Wash., mines.

J. O. ROUNDTREE has returned to Baker City, Or., and taken charge of the Baker City Sampling Works as manager for Bela Kadish.

SAMUEL BUTLER, of Grass Valley, Cal., has charge of the Nevada county, Cal., mining exhibit, Ferry Building, San Francisco.

J. F. ARMSTRONG of El Dorado county, Cal., has been appointed register U. S. Land Office, Sacramento, Cal., to succeed the late T. Fraser.

FRANK GARRISON has returned to Leadville, Colo., from Nova Scotia, where he has been examining mining properties for Boston parties.

COUNT J. DE GABRIAC of Paris, France, one of the directors of the La Grange, Cal., H. G. M. Co., who has been visiting the mine, has returned home.

J. M. HYDE has resigned as curator mining exhibit and museum of the California Mining Bureau, San Francisco, Cal., and is succeeded by C. W. Cline.

C. E. GRUNSKY, of the Board of Public Works, has returned to San Francisco from an extended observation of proposed public water supply in the California Sierras.

ROBERT MIEN, secretary Alaska-Juneau M. Co., is in Juneau. Mr. Bradley will have charge of the outlining of plans for the development of the Alaska-Juneau property.

C. M. HAMPSON has returned to Denver, Colo., from South Dakota, where he has been superintending the erection of a mill. He expects to return to South Dakota shortly.

W. LINDGREN, of the U. S. Geological Survey, is at work on a monograph soon to be issued by the survey, entitled "Neocene Rivers of the Sierra Nevada." It will contain the latest observations on the course of ancient river beds in that range.

E. W. KING, superintendent mines and mill Great Northern M. Co., Fergus county, Mont., has tendered his resignation, but the company has asked him to remain until the property either changes hands or the bond on the property expires. Mr. King desires to devote his attention to some of his own mines.

E. L. BOSQUI of San Francisco has gone to Point Barrow, where he will take native canoes and proceed up the Colville river, with supplies for three years. He has been appointed commissioner to the farthest north land yet explored for gold—the basins of the Colville and Iktpkump rivers, which empty into the Arctic ocean northeast of Point Barrow. Part of it lies in the second judicial district and part in the third, and Mr. Bosqui has commission from Judges Moore and Wickersham.

Commercial Paragraphs.

B. C. VAN EMON, formerly manager of the Electrical Engineering Co., has opened an office at 137 First street, San Francisco, and is equipped to build any and all kinds of electric and hydraulic elevators, motors, mining machinery, etc.

FAIRBANKS, MORSE & Co., through their Denver, Colo., house, report the following sales of machinery: Two carloads gasoline engines, for irrigating purposes, to Pecos Valley, N. M.; one 100-ton concentrating plant, using Standard concentrators and Sturtevant crushing machinery, for the Emmet M. Co., Boise,

Idaho; one 100-ton concentrating plant, using Standard concentrators and Sturtevant crushing machinery, to the Henson Creek Lead M. Co., Lake City, Colo.; one carload gasoline pumping plants, for Deming, N. M.; sampling works plant, operated by gasoline engine, for the Olden-Meyers Sampling Co., Black Hawk, Colo.; two 500,000-gallon duplex steam pumps, for Durango, Colo.

THE Colorado Iron Works, Denver, Colo., report the following sales: Twelve 31 cubic foot, self-dumping and righting slag trucks, for Cananea Con. Copper Co., Cananea, Mexico; one steam hoisting plant, with two double-deck cages and cage cars, for New York & Nevada Copper Co., Ely, Nev.; equipment complete for one silver-lead smelting plant, with blast furnace 36"x60", all to be made in sections for mule-back transportation, for Vicente Ortiz, City of Mexico; one rubber-top Bartlett table, for Mount Washington Copper Co., Maryland; one carload cast iron water jackets, for Compania Metalurgica Mexicana, San Luis Potosi, Mexico; one carload cast iron water jackets, for American S. & R. Co., East Helena plant; two iron-top Bartlett tables, for the Federal Lead Co., Flat River, Mo.; one set 54"x8" high-speed rolls, for Horse-shoe M. Co., Deadwood, South Dakota.

Catalogues Received.

"Section 2, Boilers and Sheet Metal Work: Mining Machinery," issued by the Holthoff Machinery Co., Cudahy, Milwaukee county, Wis., illustrates sundry standard hoilers, with appurtenances, copper converters, cyanide tanks, ore buckets, and a host of mining devices and appliances.

Under this head may be mentioned a series of leaflets from the American Engineering Works, 204 Dearborn street, Chicago, describing and illustrating in detail sundry appliances and devices supplied by that firm. They are of uniform size, twenty in number, handily arranged for filing and convenient for ready reference. The entire series is being constantly added to and constitutes an up-to-date description of many modern mining appliances.

The American Steel & Wire Co., Chicago, New York, Denver, San Francisco and Worcester, has issued a fine book of reference tables of wires for electrical purposes, comprising a table of dimensions and weights of pure copper wire, a table of comparative sizes, wire gauge in decimals, in which comparisons of the pounds per 1000 feet of copper wire of the same size numbers of different gauges are given, comparisons of the pounds per mille of copper wire of the same size-number of different gauges, table of resistance of pure annealed copper wire and standard copper conductors, table of sizes, weights and length of iron and steel. The rail bonds of the company's manufacture are described and illustrated, and several pages devoted to a list of the products made by this company are not the least interesting features of the book.

"New York Rapid Transit Tunnel:" a well printed pamphlet issued by the Rand Drill Co., 128 Broadway, New York City, essentially a description of the construction of this great engineering undertaking. It is published to illustrate the uses and applications of Rand drills and air compressors in centralized air power plants. The need of such a means of transit is shown in the rapid growth of the city in a short time, and the previous ineffectual attempts to handle the proportionate increase of travel. A brief history of legislation and attempts to start the enterprise is concluded by a statement of the award of a \$35,000,000 contract. The numerous difficulties of construction and their solution form the bulk of the description. Geological conditions, drainage and plying obstacles, and the great difficulties in passing under the large buildings and traffic-bearing thoroughfares are described, and the overcoming of all obstacles of engineering endeavor are illustrated. The whole is a good example of the marvels of present engineering skill, and is superbly illustrated. It is a good advertisement for the Rand Drill Co. of 128 Broadway, New York City, but apart from that is a most interesting account of a great work now in progress.

Obituary.

JAS. SPIERS, president Fulton Engineering & Shipbuilding Works, died at his residence, San Francisco, Cal., on the 13th inst., in the 67th year of his age. Deceased was a native of Scotland and was prominent in his business in San Francisco for many years. He was of a fine type of manhood and did much to advance the material interests of the State and city in which he so long bore honorable part.

Made From Air.

The latest achievement of science is the production of nitric acid from the atmosphere. This has long been a laboratory process, but is now a successfully solved problem on a commercial basis. It is a new triumph of electro-chemistry. The Atmospheric Products Co., at Niagara Falls, N. Y., has a plant wherein atmospheric air is decomposed and the nitrogen therein is fixed. The apparatus consists of a nitrifying chamber, which is a vertical cylinder provided with arrangements for maintaining a large number of electric arcs; a motor for causing the shaft in the nitrifier to rotate in order to produce the arcs; a motor-actuated blower for forcing a current of air through the nitrifier; a chamber in which the reaction between the gases is completed; an absorption tower, which extracts from the air coming from the nitrifier, and the chamber, the oxides of nitrogen produced by the reaction, and a 10,000-volt dynamo driven by a 2000-volt motor.

Prof. Chandler of Columbia University, N. Y., Lord Kelvin, Prof. Christy, dean of the mining college of the University of California, have personally examined the process and conducted a series of experiments that, in their judgment, demonstrate the entire success of the operation.

The former says: "The absorption tower was thoroughly washed out and the dynamo was set in motion. A solution of caustic soda was allowed to trickle through the absorption tower, and the energy employed in producing the arcs was carefully measured. The experiment was continued for 2 hours 2½ minutes, the energy consumed during this period being 12,500 watt hours, equivalent to 12.5 kilowatt hours. The product was carefully collected, measured and analyzed, in order to ascertain the amount of nitric acid or its equivalent produced during the experiment. It was found that the product, which actually consisted of nitrate and nitrite of soda, contained the equivalent of 1½ pounds of 100% nitric acid, equivalent to 1785 pounds of 70% nitric acid. (A common commercial strength of this acid.) Twelve and five-tenths kilowatt hours of energy produced, therefore, 1785 pounds of 70% acid. One kilowatt hour, therefore, produced 0.143 pound. One kilowatt per year would, therefore, produce 1253.5 pounds of 70% acid. Assuming the cost of energy to be \$20 per year per kilowatt, the expense for energy would be a little less than 1.6 cent per pound of 70% acid. The current price of this acid at the present time is 5 cents per pound. At the rate at which the acid was produced in this experiment the yield of this unit of apparatus would be 8766 pounds of 70% acid per annum."

The product of the process can be marketed in a myriad of forms to meet a great number of demands. There can be commercially produced: Nitric acid, nitric acid gas for the sulphuric acid chambers; nitrite of soda, potassa, lime, strontia, baryta, etc.; nitrates of soda, or lime and other valuable compounds.

Herewith is presented a view of the nitrifying chamber, which is a cast-iron tank in which revolves a vertical shaft at the rate of 300 revolutions per minute. One hundred and forty-four straight, platinum-tipped wires are contained on this shaft. When the shaft so speedily revolves these wires are caused to stand out straight by the resultant centrifugal force. There are 144 other wires set into the sides of the tank in six upright rows, these coming from the generator. Each of these latter is furnished with an inductance coil after they branch off from the main circuit, so that there are produced as many independent electric arcs. These arcs are formed by the revolving wires which do not come just directly

one above the other in regular rows upon the shaft, each one being set a little to the rear of the one immediately above it all the way from the top to the bottom of the shaft, thus forming spirals of the wire tips. The arcs begin at the top of each row of wires, then run from wire to wire down to the bottom, and then begin again at the top, without any interval or missing a single arc formation, as the wire at the top rotates exactly opposite to the corresponding row of fixed wires. These last-mentioned wires are likewise

Arc Dynamo Used to Operate the Nitrifier.

Nitrifying Chamber, Showing Loose Ends of the Inductances. Cooling Tower is Seen at Right.

platinum-tipped. A direct electric current is used, being supplied at a 10,000-volt pressure. The arcs assume a sickle shape as made, and vary in length from 6 to 8 inches. The tank is 3 feet diameter, 6 feet high. A 2000 H. P. motor operates the apparatus.

There is an air pocket in front of each line of points in the interior of the tank, each of which catch the air as it is decomposed by the electric arcs, and through pipes this air with its load of newly formed acids is carried down to a circular tube at the bottom of the tank, and thence to the absorption tower,

where a shower of water takes up the acids and carries them off to be subsequently recovered. Around the bearings of the revolving shaft at the top and bottom of the tank is the intake for the air, this being suitably arranged with the dual purpose of keeping the bearings cool and give free, quick circulation of the air to the arcs.

In this apparatus it is to be noted that the smaller the current used in each arc the greater the efficiency up to .001 of an ampere. At this point the arc breaks. These arcs are not disruptive, being steady and uniform in practice. They use from .005 to .002 of an ampere, this intensity producing the best efficiency. In the picture which shows the chamber, noted by the Electrical Age, there are broad trays of inductance coils from which the wires are led into the interior of the chamber. The plant which is here portrayed is the first installation. These inductances have not been arranged as they will be when the completed plant is arranged for commercial operation. They will then be placed under the floor and entirely concealed. The apparatus, it is asserted, converts about 2½% of the air forced into the chamber into acid, producing nitric acid.

The commercial aspect of the matter is of importance, and is calculated to attract the attention of manufacturers and mining men. As is well known, there is an ever-widening market for the various compounds of nitrogen, owing to the fact that the products do not depend upon any one industry for consumption, but enter directly or indirectly into a

great many of the manufacturing arts. Nitric acid is probably first in importance, as it enters into the manufacture of many widely consumed products. Dependent upon it are many coal tar products and also the high explosives, such as nitro-glycerine, gun cotton, dynamite and the large variety of smokeless powders. It lies at the base of the celluloid industry; it is used in the manufacture of the various metallic nitrates, such as nitrate of silver, so important to photography and kindred arts.

The total annual consumption of nitric acid in the United States exceeds 100,000 tons. The consumption of nitrate of potassium is large. The imports to the United States last year amounted to 21,000 tons. Nitrite of sodium is used in the color industry to the extent of about 20,000 tons per annum. Nitrate of sodium and nitrate of calcium are of the utmost importance to the fertilizer industry.

The products obtained by the electrical process have a great advantage over those made by present methods—they are chemically pure. All processes of refining are eliminated, with their attendant losses and expense, and the pure product is obtained at a minimum cost.

According to Prof. Chandler's figures, a kilowatt year costing \$20 will produce a ton of commercial nitric acid, having a market value of more than \$80. The other items of expense, such as labor, administration, interest and depreciation, altogether, it is claimed, will not exceed \$15, thus making a great number of commercial products at great profit from the viewless air we breathe.

A MINING ENGINEER who has made a big mistake somehow, sometime, somewhere, and who has cost some company a big lot of money, is not always a man to shun in selecting competent mine management. It simply means that someone else has paid for his experience and it is not always likely that he will repeat the extensive and expensive mistake. True he may make mistakes; so may any worker, for the man who never made a mistake never made anything else, but his liability to make even slight mistakes would greatly tend to be minimized by his costly experience.

International Mining Congress.

The first "International Gold Convention" met in Denver, Colo., July 7, 1897. Nearly 800 delegates, representing the United States, British Columbia, Mexico and Venezuela, were present. The Governor of Colorado was chosen temporary chairman. In the course of his address he said:

Gold is the only deity before which universal man has ever bowed. Religion has never reared an altar that has not been shaken by the shock of heresy. Political wisdom has never devised a code or constitution that did not invite revolt. No moral system has ever won general approval. Only behind the banner of gold does there trail the hungry, enthusiastic, untrained hosts of the human race. It matters not what land hore them, what faith guides them, what altar hears their prayers, what color God tinted their skins; every heart pulsates with the same love of gold—no chasm of creed or race that will not be bridged by lives and swords in its pursuit. This convention represents States that produce one-fourth of the gold of the world, and can, with encouragement of capital, double that production.

The convention committee recommended that "all discussions be confined to mines, mining and kindred subjects." Resolutions were adopted asking that cyanide of potassium be placed on the free list, and that Congress create a department of mines and mining, the head of which should be a member of the President's cabinet. A committee was appointed to revise United States mining laws and report its results to the next meeting of the convention, which changed its name to "Mining Congress," and decided to meet next in Salt Lake City, Utah.

The second annual session convened in Salt Lake City, July 6, 1898. There were 230 delegates present. Two reports were presented from the committee on proposed revision of federal mining laws. Both reports were virtually rejected. Congress was unanimously memorialized as to the necessity for a national department of mines and mining. Several technical papers were read and the Congress adjourned to next meet in Milwaukee, Wis.

September 7, 1899, was the date set for the Milwaukee meeting, but none was held. At that city, however, June 19-23, 1900, was held the third session of the Congress, which was not rated as a success, the attendance being meager, little interest being elicited, Western mining men being too busy to go a thousand miles to hear essays read by ladies and others.

The fourth annual convention began at Boise, Idaho, July 20, 1901. There was a fair attendance and the same general suggestions and recommendations made at the former meetings of the Congress were repeated and reaffirmed.

The next session of the Congress's deliberations will be at Butte, Mont., beginning September 1, 1902, and gives some promise of being run on lines that will

give metal miners of the West encouragement to take active interest.

This paper has cordially commended the aim and intent of the Congress, and would be pleased in the public interest to note continuous, active zeal in its annual gatherings.

Anything of the kind, whether it be a mining organization or other association, will have life commensurate with its usefulness; when it ceases to be any good it dies. A convention largely left to its own devices is not always capable of the highest possibilities of good at its command. The fact of its makeup makes it unavoidably unwieldy, and hence it can probably best accomplish what it sets out to do by working through suitably selected committees. The record of proceedings of the meetings can not fairly be taken as a measure of their work. It is really what the committees do that make up the real work. The annual meetings should be largely for the purpose of discussing questions of actual commercial interest to mining men, listening to the reports of the committees and instructing such committees as may be appointed for the ensuing year. The work of the Congress shouldn't stop when the chairman perfunctorily puts the "move we adjourn." It should go right on through the committees, and be really a continuous performance.

There are a great many things happening right along in the mining world. In these things the Mining Congress could have prominent and beneficial share. It should leave out sentiment and flummery and be strictly business. Rightly run, it can be of great aid to general mining interests. It can add the weight of its influence to the great effort for uniform national mining legislation, to the ever-growing demand for a cabinet department of mines and mining; it can make sound recommendations as to the commercial aspect of mining affairs the good sense of which will commend itself to miners everywhere; it can influence public opinion to a certain extent, but can do better work by one center shot than by firing a thousand arrows into the air.

The business of mining and anything in mining that it is business to consider comes under its legitimate notice.

And, on the other hand, it is to be remembered that the standard of criticism by which it is to be judged should be a kindly one. It is the creature of the miners themselves; they can vivify or kill it, and its ability for good, or even its excuse for existence, is in direct proportion to the moral or material aid extended to it by the men whom it represents.

Mining Employment Bureau.

At various times suggestion is made regarding economy in mining operations, more or less practical. One of those suggestions is the basis of a scheme now started in Germany. Its title and scope do not agree with the heading of this article, but that is really what it amounts to.

At intervals organizations with various titles have been started in this country, designed ostensibly to be of public benefit, but destined to dissolution because of inherent tendency to subordinate the scheme to private interests.

With what appears to be commendable intent has been organized at Frankfurt, Germany, an association calling itself the Central Mining Institute, which claims to be independent, founded on public requirements, and in touch with actual technical and economic mining and scientific conditions. It is composed of bankers, promoters, merchants "and others," doing business in different German cities, and announces that as an organization it will not engage directly or indirectly in mining or other industrial enterprises, and any of its members who propose doing anything of that kind must first get permission from the management. The organization proclaims its ability and intent to assist investors, furnish reliable and unbiased advice and in general to put the whole business of mine investment upon a high scientific and economical plane. The institute will make no charge less than 50 marks, and, whatever its profits, will never declare a dividend to exceed 5% annually on the capital stock.

Among other things it offers to do are:

Recommendation of experts; negotiating the engagement of experts; giving instructions to experts; undertaking mining operations for the investigation

of deposits; prospecting, boring, opening up of old workings, and exploration of work; advice in matters relating to claims and concessions; execution of geographical, geological and mining surveys; preparation and equipment of expeditions abroad for the investigation of larger objects; practical tests in connection with concentration and metallurgical treatment; assisting investors with a view to an experimental working of mines; a sketch of or opinions on the working schedules of mines; technical and economic advice concerning the working of mines; supervision of the work of mines; determination and tests of ores and minerals; assays and chemical analysis of such samples; information relating to claims and concessions; information concerning mining law and mining administration, general mining conditions in the most important countries and districts, methods of working, labor conditions and other economic, social and legal questions in connection with mining; information relative to the geographical position, geological and climatic conditions; addressing inquiries to institutions and experts concerning metallurgical treatment and results, communicating to clients and information received.

In special cases, the Central Mining Institute also undertakes:

The preliminary examination of proposed enterprises, based on expert reports, estimate of costs, maps, plans, etc., with a view to determining whether the institute shall advise:

(a) Whether or not the proposition should be entertained. (b) Whether a more detailed expert report should be made. (c) Whether the data submitted are sufficient warrant for a favorable consideration of the proposition.

Criticisms or reports and data submitted by experts; to make local investigations and render expert opinions.

This is an extensive program. It may be that many American miners reading it may say or think: "This is the thing we long have sought, and mourned because we found it not." The plan is ideal, almost Utopian. That it deserves commendation goes without saying. If such a mining employment bureau can live and prosper it will be of direct benefit and encouragement to miners anywhere, and its success should be chronicled with delight.

THE object of oil is to diminish friction by interposing a thin film between the sliding surfaces. To insure perfect lubrication the surfaces must be kept coated at all times and under all pressures and velocities. In steam engines there is a sliding and a rotating friction, and it is doubtful if any one kind of oil is perfectly suited to both. Oil has no tendency to improve the character of a bearing, its function being simply to keep the bearings apart and prevent friction and heating.

In the bonding of mine property it is difficult to preserve proper proportion between the bond and hondee. The general tendency is to make the time for which the bond is given shorter than heretofore, as mine owners object more and more to tying up their properties with men who may not do anything with it except make a commission on a sale, though a working bond with forfeiture clause would usually obviate that difficulty. Much depends on the mine and more on the bond, but as a rule six months should be long enough.

F. H. NEWELL, chief of hydrography of the United States Geological Survey, is traversing the west half of America in furtherance of the work that has been under his direction since 1890—reclaiming the vast tracts of arid land. It is a tremendous work, one that has been at last undertaken in a practical way by the general government, and a matter that is of direct interest to mining men. "The tree is the mother of the fountain." The conservation of water is becoming more and more a pressing necessity, and in the work which is well represented by Mr. Newell and his associates lies a large measure of the country's welfare and progress.

On page 103 appears a statement, apparently official, regarding the alleged discovery of platinum in Wyoming. At the time of the announced discovery two samples of the ore in question were sent to this office and examined, with no corroboration of the assertion. It is believed that the U. S. G. S. statement in the article on page 103 is a mistake. This week is received an account in detail of the finding of platinum in place at Burnt Basin, B. C., which appears more authentic than the statement from Wyoming was. Similar statements are often made, but so far with no foundation in fact. The finding of platinum in place would be an event of great metallurgical importance.

Concentrates.

AN injector requires steam for its successful operation; hot water will not answer the purpose.

HEATING by direct radiation means that the radiators are located directly in the rooms to be heated.

THE Kennedy, Amador county, Cal., is probably the deepest purely gold mine in the country—2600 feet.

IN "a carload of miners' candles" there would be or could be 500 boxes, 240 each, and 160 boxes, 120 each—139,200 candles.

A ROUND tank 15 feet in diameter, 20 feet high, would hold 26,440 gallons. Counting 25 cubic feet to the ton, it would hold 141.4 tons ore.

APERTURES in the form of a circle are the most effective for the discharge of water, because for the same area there is less frictional surface.

THE only electrolytic nickel and copper refinery in operation in America at the present time is the Canadian Copper Co.'s plant near Cleveland, O.

SOME geologists hold that the gold of the Rand, South Africa, has a marine placer origin, and is neither the result of impregnation nor precipitation.

IT is not at all unusual for duplex sinking pumps submerged over 100 feet when furnished with steam to start up, clear themselves and pump the shaft out.

AN aperture 12 inches high, 12½ inches wide, in a 1½-inch plank, head 6 inches above top of opening, will discharge 200 miner's inches, each equal to 1.4994 cubic foot water per minute.

IN any capacity around a mine everybody has not only to look out for himself, but for all others. Ordinarily one has only to take care of himself, but in or around a mine he must care for others, too.

WIRELESS TELEGRAPHY is considered a commercial success. Besides transmission of news, pictures have been sent by this means, and shore operators can light or extinguish incandescent electric lamps at will.

THE resistance of friction in the flow of water through pipes increases as the distance is greater. In wooden pipes the friction is 1.75 times greater than in metallic pipes. Doubling the diameter of a pipe increases the capacity four times.

THE tensile strength of a rivet is usually much greater than its shearing strength, but this is counterbalanced by the fact that when two boiler plates are riveted together, the friction which must be overcome before they can be torn apart is very great.

THE "non-accessible stock" advertised in the Eastern paper is probably meant for "non-assessable" stock, though in the case brought to "Concentrates" notice there is little choice, except that in any event the buyer should be allowed "access" to the stock.

IT is a good plan to let the engine exhaust into the heating system, but it is not necessary or advisable to have the inner surface of the pipes coated with the dregs of cylinder oil. It is well to put a separator in the exhaust pipe and locate it near the engine.

ACCORDING to a decision recently made by Binger Hermann, Commissioner of the General Land Office at Washington, before a claimant can secure a patent to a desert land entry he must be the owner of a permanent water right and have conveyed the water to the land in permanent ditches.

THERE are several good manufactured coverings for steam pipes. If impossible to get any of them in the isolated spot from which the inquiry comes sawdust mortar might be used. A 6-inch pipe can be boxed in a wooden box of 10 inches diameter filled with sawdust mortar—one barrel of lime to five of sawdust.

ORDINARILY the term ore dressing may be considered as separating different minerals in such a way as to place each distinct product in proper shape for market. Concentration is quite different, being the rejection of the maximum possible quantity of waste material that the ore thus enriched may more readily pay transportation and treatment charges.

A MINER'S INCH of water, legal measure, in the State of California (Civil Code, Sec. 1415), is that quantity of water which will flow through an opening of 1 square inch in the bottom or side of a vessel, under pressure of 4 inches above the opening. One miner's inch will discharge in twenty-four hours 2,260 6 cubic feet, or 16,756 gallons. This amount of water would fill a cube of 13 feet 1½ inches in diameter and would weigh 70½ tons.

OUTSIDE of California quicksilver is produced in marketable quantities in Oregon, British Columbia and Texas. In Brewster county, Texas, two companies are producing, the 1901 output being about 3000 flasks. The Texas cinnabar is of the crystalline variety; native quicksilver is also found in limestone there. A technical description of the Terlingua, Texas, quicksilver deposits, written for this paper by a member of the U. S. Geological Survey, appeared in a recent issue.

"A FOOT OF WATER" is the amount flowing through an opening a foot square under 4 inches pressure, or 1 cubic foot per second flowing through an opening of 50 square inches. Where 750 feet of water is carried in a ditch the water will move 12 feet per second on the grade stated in the query, which would wash out the ditch in little time. Water moving next the bed of a ditch at the rate of ½ mile per hour will move fine sand, will

move gravel when so flowing at the rate of ¾ mile per hour; gravel, 1 inch diameter, 1½ mile per hour; soft rock 3½ miles per hour.

ONE GALLON of fresh water weighs 8½ pounds. One cubic foot of water contains 7 4805 gallons and weighs 62.37907 pounds. For convenience of computation, a cubic foot of water contains 7½ gallons and its weight is taken at 1000 ounces, or 62½ pounds avoirdupois. Two hundred and forty gallons of water weigh one ton of 2000 pounds and measures 32 cubic feet. The water (240 gallons weighing one ton) would fill a cube measuring 3 feet 2 inches for each of its three dimensions.

MANIFESTLY the immediate cause of the glacial period in the Sierra Nevada mountains was heavy precipitation combined with sufficient cold to cause the water to fall as snow. The general cause was cosmic and elevation was secondary. With the present precipitation at Summit, Truckee and other California points a slight average decrease of temperature would cause a revival and advance of Sierra Nevada glaciers. There have been two ice periods in the Sierras, and in the eons of future time a third is among geological possibilities.

THE following is a formula for water-proofing blue prints: Immerse in melted paraffine until saturated a number of pieces of an absorbent cloth. When these are withdrawn and cooled they are ready for use at any time. To apply to a blue print, spread one of the saturated cloths on a smooth surface, place the dry print on it with a second waxed cloth on top, and iron with a moderately hot flat iron. The paper immediately absorbs paraffine until saturated, and becomes translucent and highly water-proof. The lines of the print are intensified by the process, and there is no shrinking or distortion.

THE U. S. Circuit Court of Appeals, 79 Federal Reporter, page 277, decided in the case of Republican M. Co. vs. Tyler M. Co., that when a lode enters an end line of a regularly located mining claim, and runs its course, lengthwise, nearly parallel with the side lines of the claim for the greater part of the length of the claim, the owners of the claim are not deprived of their extralateral rights because the lode crosses a side line before reaching the other end line, but such rights will extend from the end at which the lode enters to the point at which it crosses the side line, whether a new end line is regarded as being drawn at that point or not.

TO PREVENT explosions from low water, boilers should always be provided in the highest part of their crown-sheet with a hollow brass plug having the cavity filled with tin, which melts at a temperature of 442° F. If the water falls below this point, the tin becomes overheated and melts, thus allowing a jet of steam to escape as a warning of the approaching danger. All boilers should have a pump attached for filling them when the injector is out of order or is being repaired, and the water should be hot, like that from a feed water heater. When two or more boilers are connected with the main steam pipe, due allowance should be made for contraction and expansion, so that the lateral connection may not be injured.

IN speaking of the capacity of a certain compressed air plant as being equivalent to forty drills, this power is true of the machinery only at sea level. The altitude of Rossland, B. C., being 3410 feet above sea level, means the pressure of the atmosphere is not equivalent to a column of mercury 30 inches in height, but to one of something less than 27 inches, hence the mechanical power of the engine has first to overcome this greater tenuity of the air before it can begin to compress the atmosphere to a greater density, so as to develop power at the drills employed. The size of the drills also makes a difference. The power of a compressor at sea level and calculated to work steels 2½ inches in diameter, which can be expressed at forty drills, would in Rossland, at a higher level, with a larger drill, be better expressed by a 22% reduction.

IT has always been difficult to determine the actual amount of moisture which is contained in steam; some light is thrown on the subject by the use of superheated steam. For instance, at a working pressure of 125 pounds 1% moisture would represent about 20° of superheat. Under the best conditions of properly proportioned steam pipes, and well covered, there is a loss of ½° to ¾° F. of superheat per foot of steam pipe. It would not be out of reason to assume that with ordinary large and indifferently covered steam pipe the loss would reach 1° F. for every foot of pipe; consequently a pipe 100 feet long might lose 100° of superheat, corresponding to 5% of moisture in the steam, provided the steam was dry on leaving the boiler. Even assuming ¾° loss per foot, we should have a condensation of 2½% in a steam pipe of this length.

THE extraction of antimony is difficult, owing to its volatility and affinity for oxygen. The process consists in heating the crude ore covered with charcoal on the bed of a furnace, when the sulphide of antimony fuses, leaving unmelted the earthy impurities; the liquid is drawn off into iron molds, where it solidifies and is reduced to coarse powder, placed on the bed of a reverberatory furnace and heated with access of air, for the oxygen contained therein, when the sulphur passes away as gaseous sulphurous acid, leaving behind the antimony teroxide. The roasted mass is then mixed with one-sixth of its weight of powdered charcoal, the whole moistened with a solution of carbonate of soda and raised to bright redness in crucibles, when the metal antimony trickles to the bottom, the impurities left above in the spent flux or scoria, the crocus of antimony.

A CUBIC FOOT of solid quartz weighs 166½ pounds avoirdupois; its specific gravity (with water as the unit, viz., 1.000) is 2.660; that is, quartz is 2½ times as heavy as water; the weight of water is about 37½% that of solid quartz. Twelve cubic feet of solid quartz in place will weigh one ton of 2000 pounds avoirdupois; but a quartz vein contains 12%, more or less, waste, and on that account 13 to 14 cubic feet of vein quartz will constitute a ton. A fair average, allowing for waste, in a running vein should be 13½ cubic feet to the ton of 2000 pounds. On this basis a cubic foot would weigh 148.15 pounds. A cube of this ordinary quartz, 2 feet 4½ inches dimensions, would contain 13½ cubic feet and weigh one ton of 2000 pounds. A cube of the same dimensions filled with water would weigh only 843½ pounds, showing that the weight of water is about 42% of the weight of ordinary quartz weighing 13½ cubic feet to the ton.

REGARDING the advantage of obtaining metal from a sulphate as against a chloride solution, those in charge of large electrolytic refining works have not been prevailed upon to adopt the chloride solution method, instead of the method in present use. The chloride method is old, has been tried under a variety of conditions and with modifications, but has not yet attained commercially practical prominence. Electro-metallurgists are aware that the speed of reaction is too slow, and the apparatus and process too complicated for ordinary practical purposes. In a few cases it may be desirable to utilize the evolved chlorine, and the chloride method may then be found suitable, but it is deemed inadvisable at present for large refiners to go to the expense of erecting a costly plant for liquefying chlorine gas or making bleaching powder when it is considered that the returns would be reduced to an unprofitably low figure as soon as such methods were generally adopted and the market flooded with chlorine obtained in that way.

THERE are two methods in general use for testing boilers, known as the hydraulic and the hammer tests. The former is made by filling the boiler with water, and then by using a force pump the pressure is raised to 50% more than it is intended to carry the steam. Thus a boiler which should carry 100 pounds steam pressure must stand a 150-pound hydraulic test, and this percentage increase in hydrostatic pressure is commonly adopted by boiler inspectors. The steam gauge should be used to determine the actual pressure, and this should be of standard make and known to be correct. Without such knowledge the test is useless and may result in injury to the boiler through excessive pressure. The hydraulic test even under the best method of application is liable to strain the boiler so much that when it is heated again the expansion may produce a leak. In the hammer test, all accessible parts of the boiler are tapped with a light hammer, including the shell, crown-sheet, front and back connections, tubes and braces. The sound produced shows to the practiced ear the condition of the boiler.

SPECIFIC HEAT means the quantity of heat necessary to raise the temperature of a body a given amount, compared to the quantity required to raise the temperature of the same weight of water a like amount. For instance, the specific heat of cast iron is .1298; this means that it will require but .1298%, or, practically, one-eighth as much heat to raise the temperature of one pound of cast iron 1° as would be required to raise the temperature of one pound of pure water 1°, the latter quantity being accepted as the standard. Suppose the temperature of one pound of water is raised 100°. This same amount of heat, if put into a pound of cast iron, will raise the temperature more than 100°, because it only requires about one-eighth as much heat to raise the temperature a given amount. To find out just how much the temperature of the cast iron will be raised, one may multiply the quantity required by the water by eight, or divide it by the specific heat of cast iron. The 100° increase in the temperature of the pound of water will be equivalent to an increase of 100 ÷ .1298 = 770.4° in the temperature of the pound of cast iron.

COMMON solder contains equal weights of lead and tin; fine solder contains two parts of tin and one of lead; coarse solder two parts of lead and one of tin. In solder the proportions of metal can be judged from the appearance of the alloy. When it contains a little more than one-third of its weight of tin, its surface, on cooling, exhibits circular spots due to a partial separation of the metals, but these disappear when the alloy contains two-thirds of its weight of tin. These alloys melt at a much lower temperature than either of their constituent metals. Common solder melts at about 240° C., and fine solder at 180° C., while the melting point of tin is 232° C., and that of lead 327° C. Soldering is not entirely a mechanical adhesion, depending, partly, on the formation of an alloy between the solder and the surface of the metal to be soldered. This makes it absolutely necessary that the surfaces to be united by the intervention of solder shall be perfectly bright and free from oxide. Several substances are employed to insure this at the moment of applying the solder; one of the commonest is muriatic (hydrochloric) acid, "killed" with zinc; that is, in which a lump of zinc has been dissolved to form a chloride of zinc which melts over the surface of the work, dissolving any oxide and protecting the metal from the oxidizing action of the air. Sal-ammoniac, or sal-ammoniac and chloride of zinc, are sometimes used. Resin in powder is often sprinkled over the metal to be soldered, when the heat melts it and forms a varnish to protect the metal's surface from the oxygen of the air.

How to Identify Precious Stones.

In last week's issue appeared a report from Nelson Creek, Plumas county, Cal., that what were believed to be diamonds had been discovered there.

Diamonds have been discovered at various points in California, notably near Placerville, El Dorado county, and Cherokee, Butte county. The formation at the latest report scene of diamond discovery is not considered extremely favorable to diamond formation. A few remarks on how to identify precious stones in general may be timely:

Difficulty is frequently experienced by prospectors and others, who have not had opportunities of handling precious stones in the rough, to distinguish them one from another and discriminate between gems of great value and others which are comparatively worthless. It is a mistake to place any reliance whatever upon color as a test of a precious stone, as there is no property natural to gems which is so fickle and unreliable as that of color. For instance, if a stone be red, it is not of necessity a ruby, nor a white stone a diamond; and are there not yellow sapphires, green diamonds and blue spinels? Of course, the connoisseur and expert in gems values and appreciates the slightest variation of tone and depth of coloring in jewels which may increase or decrease their value upon the market. In the diagnosis of precious stones it is advisable to apply as many different tests as possible to each specimen, and to be guided by the result of them all, as it often happens that one is apt to be misled by the application of a single test.

Most of the precious stones (opal and turquoise are the exceptions) are crystals of rare minerals occurring in nature in more or less familiar geometric crystalline forms, such as cubes, octahedra, rhombic dodecahedra, hexagonal pyramids, scalenohedra, prisms, etc., which are classified by mineralogists into six systems, the study of which comprises the science of crystallography. Although a knowledge of crystallography, or the natural forms in which crystals occur, is of value in successful discrimination of rough precious stones, it is not a subject which can be easily mastered, or brought into practical use without considerable application and study. The reason for this is that, with the exception of diamonds and a few other gems, crystallizing in the "Cubic System," precious stones are seldom found to exhibit more than a trace of their characteristic crystalline formation, which fact is due to accidents at some remote period of their existence, rough usage while immersed in rivers and torrents, etc.

The natural properties of gems, which are most easily and most universally used as tests, are those of "hardness" and "specific gravity." By the hardness of a gem is meant the degree which it possesses of resisting abrasion. Many of the hardest minerals can be easily broken, fractured or chipped, though they can not be scratched; thus, a very hard stone may be a very brittle one. Diamonds, emeralds and zircons, for instance, have often been injured by a blow or a fall. There is a scale of hardness, consisting of twelve minerals, which forms a recognized standard to which specimens under examination may be compared, as follows: Diamond, 10; sapphire, 9; topaz, 8; quartz, 7; feldspar, 6; apatite, 5; fluor spar, 4; calcite, 3; rock salt, 2; talc, 1. Fragments of these minerals, suitably mounted in little handles, are applied in succession to the gem to be examined, so as to attempt to scratch it. When the gem neither scratches nor is scratched by any member of the scale, the two stones may be considered of the same hardness. When it scratches the softer and is scratched by the harder of the two test stones, some idea of its position between them may be obtained by drawing all three specimens, with slight pressure, across the surface of a fine, clean, hard file, and noticing the different degrees of resistance to abrasion and the sound produced. This operation requires to be done with a delicacy of touch made perfect by practice alone. The following list of a few of the gems and their degrees of hardness will serve to show their relative position: Diamond, 10; sapphire, 9; ruby, 8.8; chrysoberyl, 8.5; zircon, 7.8; emerald, 7.8; green garnet, 6. It is an interesting fact, although of no importance in distinguishing precious stones, that slight variations in hardness exist between individual specimens of the same kind of gem brought from different parts of the world, and often, too, even between those obtained from various mines in the same locality. Thus, the toughest diamonds come from Australia, while Indian and Brazilian stones are harder than those from the Cape.

To obtain the "specific gravity" of a stone is to ascertain its weight compared with the weight of an equal bulk of distilled water (generally taken at 60° F. or 15.6° C.). There are several methods of applying this test. The one in general use consists of a delicate balance, by which means a stone may be first weighed in air and then in water; thus the weight of the bulk of water displaced may be ascertained. If, for instance, a sapphire weighing 4 grains in air weighs only 3 grains in water, it has evidently displaced 1 grain of water, becoming lighter by that amount—so that the number 4 represents the specific

gravity of sapphire, showing, as it does, the number of times that the weight of any bulk of that stone contains the weight of an equal bulk of water. Another method of performing this test is by measuring or weighing, directly or by difference, the water which the gem displaces when immersed in water in a small vessel of known capacity; but this method does not admit of great exactness. By far the simplest means, however, of obtaining the specific gravity has been introduced lately. Liquids of different degrees of density are used, in which the gems either float or sink according to their relative weight. A solution of mercuric iodide in potassium iodide ("Sonstadt's solution") is a liquid of great service, which should be made up to solutions of several different densities, viz.: Solution A = 3.17; solution B = 2.9; solution C = 2.67; solution D = 2.63. This fluid has, however, the disadvantage of being very poisonous and corrosive. Another suitable liquid is methylene iodide, which is easily diluted by the addition of benzine—each drop of benzine making the liquid less dense. Nothing can be easier or more satisfactory than this method; however minute the stone may be, it can be identified by its density in a few moments. Suppose it be doubtful whether a certain gem is an aquamarine or a chrysoberyl; all that is necessary is to place it in a tube of methylene iodide, together with a small fragment known to be aquamarine, to serve as an index. If it be a chrysoberyl, which has a specific gravity of 3.6, it will immediately sink; if it be an aquamarine, which has a specific gravity of 2.7, it will float, in which latter case, if the liquid be diluted and stirred until the index fragment is exactly suspended, the doubtful gem also will neither float nor sink, but will remain poised beside it. The delicacy and simplicity of this method is great; the only reason why it has not been more generally adopted is that a great number of gem stones are heavier than methylene iodide. But this objection is now removed. There is a colorless solid compound which melts at a temperature far below that of boiling water to a clear liquid five times as dense as water, and, therefore, sufficiently dense to float any known precious stone. This compound is a double nitrate of silver and thallium, and possesses the remarkable property of mixing in any desired proportion with warm water, so that by dilution the specific gravity may be easily reduced. The fused mass may be reduced in density by adding water drop by drop, so as to suspend in succession jargon, carbuncle, sapphire, ruby, chrysoberyl and spinel.

The optical properties of precious stones form valuable means of identifying them, especially when cut and polished; and there are several different kinds of scientific instruments of a more or less practical character which can be applied in this connection. The method of measuring the extent to which a ray of light is refracted in passing through a gem may be measured by the goniometer, an instrument found in every physical laboratory. In order to avoid the necessity of cutting the stone into a prism, it is advisable—after finding two of the facets, which form a convenient angle—to paint over the remainder of the stone. The ray of light may then be traced through the two open facets, and in this way can be measured not only the refraction, but the double refraction of the stone. For this purpose, also, the little instrument known as the reflectometer is simple, but only useful to examine gems of low refractive power, such as topaz and less brilliant gems. The dichroscope is an instrument which enables one to tell at a glance whether a gem be doubly refractive or not, thereby deciding at once if the specimen belongs to the cubic system of crystallography or not. This is of value in distinguishing rubies and sapphires from other somewhat similar stones which might be mistaken for them, and is in general use among gem merchants. It is not commonly known that many transparent minerals, when viewed through a spectroscope, cause characteristic black bands to appear across the spectrum. Two of these minerals happen to be the gem stones jargon and almadine garnet, sometimes called carbuncle. When a stone, say, one set in a ring, is looked at in this way and gives the characteristic spectrum of zircon, it is at once known to be jargon, without any further trouble. A crystal of tourmaline, while being warmed, becomes electrified, one end becoming charged with positive and the other end with negative electricity. Advantage has been taken of this fact to make a test for tourmaline. If a mixture of powdered red lead and sulphur be blown or shaken through a sieve, the particles become electrified by mutual friction, and if it then be dusted upon a crystal of tourmaline which is being warmed, the positively electrified end of the crystal attracts the negatively electrified yellow sulphur, and the other end attracts the positively electrified red lead—thus one end of the crystal becomes red and the other yellow. Now every crystal of tourmaline behaves in this way, and no other gem stone, so that this is a practical test as well as a pretty experiment. If a drop of water be placed by means of a needle on the stone to be tested, which has previously been thoroughly cleaned, the drop will spread out on an imitation, while it retains its drop shape on a true diamond. A strip of aluminum may be passed over a diamond, from which all grease has been removed, without it acquiring even a trace of it. On imitations, however, the metal will give off some of its color. A sure test, however, is hydrofluoric acid,

which, applied to the true diamond, will not affect it, but will eat into and frost an imitation.

A knowledge of precious stones, however, is not a subject which can be acquired in half an hour, but necessitates a good deal of close application and constant practice.

Cornish Pumps.

The largest Cornish pumping plant is the Chapin pump of the Chapin M. Co., Iron Mountain, Mich., designed to pump 3000 gallons per minute from a depth of 1500 feet. The engine is of the vertical type and compound, and stands 54 feet from the floor. The high pressure cylinder is 50 inches and low pressure cylinder 100 inches in diameter, stroke 10 feet. The flywheel is 40 feet diameter and weighs 164 tons. The total weight of the engine, exclusive of pump and shaft works, is 600 tons.

The pump end is attached directly to the beam end which overhangs the shaft. The pumps are of single-acting Cornish type, plungers 28 inches in diameter, 10-foot stroke; number of strokes, from four to ten; pumps are arranged in series, each set with a lift of about 200 feet. The plant was designed and built by the E. P. Allis Co. of Milwaukee, Wis.

There is a large Cornish pumping engine at the Ontario mine, at Park City, Utah.

As the various shafts and levels have been extended the amount of water to be handled steadily increased. Up to the time that the drainage tunnel was constructed from No. 3 shaft, at the 600-foot level, all the water—about 4500 gallons per minute—was pumped and discharged through a short tunnel about 500 feet from the surface. The first drainage tunnel from No. 3 shaft carried off all the water of the mine as low as the 600-foot level.

Below this level, however, all the water had to be pumped, and it was decided to erect a large Cornish pump. The pump, which was installed at the mouth of shaft No. 3, was from the design of W. R. Eckhart of San Francisco.

The two large cylinders are nearly vertical, being at the same height and inclined toward each other at the top. The high pressure cylinder is 38½ inches in diameter; low pressure, 70 inches; stroke of each, 10 feet. The cylinders are both steam-jacketed, and have cut-off valves, though the steam is usually controlled by the throttle valve. The piston rods are connected by the opposite ends of a walking beam, or "hob," the connecting rod to the crank which turns the flywheel is attached to a pin at the top of the hob. This connecting rod is 28 feet long; the arms are 14 feet 6 inches. The flywheel is 30 feet in diameter and weighs fifty tons, its shaft being 22 inches at the flywheel, 16 inches at the outboard and 20 inches at the crank rod journal. The engine's speed is five to seven revolutions per minute; it works with a steam pressure of 100 pounds. The engine uses a jet condenser. The connecting rod to the pump rod is attached to the hob at the same end as the connecting rod of the high pressure cylinder, but lower down, the distance from center of pins being 4 feet 2 inches, with 14-inch diameter journals, the journals for pins for the engine connections being 10½ inches in diameter. The total weight of the hob is seventy-five tons. The foundations of the engine are 54 feet below the surface, the cut stone necessary being carried up. Over 7000 tons of quarried work were required in the foundations. The pump shaft is 7x9 feet, with enlargements at pump and hob stations, and is heavily timbered. The pumps are located at the 1000-foot and 800 foot levels, water being pumped up to the 600-foot level. The pump rod is made of 16-inch square pine, in 60 to 80-foot lengths, the joints being made by four straps of iron 1x12 inches by 30 feet, thus giving a lap of 15 feet. The two pump columns are 18 inches in diameter and are riveted wrought iron. At the 300-foot, 500-foot and 700-foot levels are placed balance hobs connected with the pump rod, the design being to give the engine the same amount of work on the up and down strokes. These balance hobs each have counterweights of twenty-nine tons. The two pumps at the 1000-foot level have 20-inch plungers, with 10-foot stroke. The sump is 45 feet deep, but is nearly always full, the suction never exceeding 10 feet. Between 300 and 350 gallons are pumped at each stroke, the water discharging from the lower pumps into a tank located upon the 800-foot level, where two pumps similar to those at the bottom are put in. The capacity is about 2500 gallons per minute. The engine and pumps cost at the factory \$110,000; the total cost, including foundations, erection, buildings, pump, shaft equipment, etc., was about \$250,000. Besides the Cornish pump, there are four steam pumps underground to relieve it in emergencies, and to act as auxiliaries during the largest flows of water. There is one each at the 1000-foot and 800-foot levels of shaft No. 3. There are two additional columns of 15 inches diameter each in the pump shaft for these pumps. Steam is supplied to the pumps in No. 3 shaft by a 6-inch pipe, jacketed with 1½ inch of asbestos, and about 1000 feet long in all. Coal is hauled from the mines at Coalville, 22 miles distant, and costs \$4 to \$4.50 delivered at the mines.

Turquoise Mining in Arizona and New Mexico.

Turquoise is found in California, Nevada, New Mexico and Arizona. In New Mexico are the most extensive developments of turquoise on the American continent. The Mexican name for this stone is chalcitl. The mines of New Mexico were operated long prior to the Spanish conquest. Near Cerrillos, south-

greatly. In the vicinity of Santa Fe the matrix is usually a white trachyte stone filled with bright crystals of pyrites, which upon decomposition from exposure turns a rusty brown. In some cases the matrix is red sandstone. In the Burro mountains the formation is rose quartz, slender needles of which penetrate the turquoise deposit, spoiling it for gem purposes. In the Hachitas the matrix is a red granite. It is difficult to account for these vagaries in formation, existing in the case of no other mineral known to science. The turquoise solution in the form

quoise rock shows up in paying quantities. Then drifting begins, the rock is blasted and then broken into portable shape by sledge hammers, then put into a bucket and hoisted to the surface by windlass, then

Turquoise Mines in Arizona: "Turquoise Mountains," 2½ Miles South of Mineral Park. The mountain has shafts sunk in a number of places by ancient miners "in the Stone Age." Stone hammers and prehistoric tools are scattered over the surface.

ern Santa Fe county, is a section of mountainous country over 200 acres in extent, every foot of which has been worked over in search of turquoise. The Indian method was crude, the only implement being a stone hammer. The New Mexican miner of to-day follows the lead of his Indian predecessor in these old mines, but goes about 10 feet deeper, there finding his purest gems. The Indians had a primitive method of blasting turquoise rock. Over the mass they would build a hot fire and then dash water upon it, causing the rock to crack. Then the stone hammers came into play and the ore was crushed into small pieces, then polished as beads, which were drilled, strung and worn as ornaments or charms.

Valuable turquoise deposits exist, notably in the Burro mountains near Silver City, about the Hachitas and in the Jarillas as far south as Las Cruces. Near Cerrillos most of the claims are the old filled-up

of a liquid was at some period infiltrated into the seams of the rock, where it gradually solidified. This is demonstrated by the fact that wherever the veins are wide enough the turquoise are found in uniform pebbles with a talcose surrounding. Turquoise is found in commercial quantities in Lincoln Co., Nev., and San Bernardino Co., Cal. Bulletin No. 25, compiled by Chas. G. Yale, and issued by California State

The Chaleha, N. M., Turquoise Mine.

sorted, packed into boxes and shipped to firms that have contracts with the mine owners for cutting. Most of the New Mexican turquoise goes to New York, very little being cut in the Territory. The average Mexican turquoise miner gets \$1.50 per day; Americans get \$2.50. The larger mines work only seven to ten men each, and in good rock this force could take out from \$8000 to \$10,000 daily. This was the record of one mine near Cerrillos for six months, then the pay streak petered out and there was three months of dead work. Those engaged in this industry, knowing that they have a good thing, try to create the impression that the mines are being conducted at a loss. This causes them to maintain strict secrecy in everything relating to business. They will not allow photographs to be made, or consent to allow any one to inspect the mines; neither will they give any information concerning the subject in general.

Turquoise Mines in Arizona: Some fine gems were found on the summit of this hill, 6500 feet above sea level, 1 mile east of Mineral Park, Mohave County, Arizona.

New Mexico Turquoise Prospectors.

mines of slavery days, though several have been opened on virgin ground. Great secrecy is maintained, both as to the location of mines and the method of working them. No one is allowed to inspect a turquoise mine, and employees are warned against giving any information concerning operation upon pain of immediate discharge.

The formation in which turquoise is found varies

Mineralogist L. E. Aubury on Aug. 15, 1902, states that in 1901 there were mined in San Bernardino Co., Cal., 500 pounds turquoise, worth \$20,000.

Chemically, the American turquoise has about the same properties as the Persian product, the former being composed of: Alumina, 47.75; phosphoric acid, 27.34; water, 18.18; protoxide of copper, 2.02; peroxide of iron, 1.10; peroxide of manganese, 0.50; calcium phosphate, 3.41.

The profit in turquoise mining is found in the simple and inexpensive methods of handling the ore. No costly machinery, no intricate and expensive treatment of the product of these mines are required. From surface indications a shaft is sunk, until tur-

Turquoise mining has its troubles and trials, like all other forms of mining, and the turquoise prospector is, like other prospectors, subject to imposition.

Under date of August 6, 1902, Jas. W. Haas, a veteran Arizona miner of thirty-seven years' varied experience, sends two photographs and tells of some of the inside workings of turquoise mining and prospecting, which, though not meant for publication, will be read with relish by many who have been through pretty much the same general experience. Writing from Mineral Park, Mr. Haas says:

"I sometimes see in the MINING AND SCIENTIFIC PRESS mention of the turquoise found in California

and New Mexico; but very little is now said of the turquoise in Arizona. Now I will give you a brief idea or sketch of the turquoise and mines in this section, as I am the man who worked for years to bring them into market and prominence. I have just sold to a New York company, or people, who now style themselves the Aztec Turquoise Co., and who have expended over \$30,000 in labor and improvements in less than two years. I have shipped to them in New York over \$100,000 worth of gems and stones from their mines here.

"About twenty-eight years ago, in prospecting for precious metals, I came across an old dump which had been worked by soldiers stationed at Fort Mohave—a company of the California Volunteers—about 2½ miles south from Mineral Park; on that dump and scattered over the ground were small pieces of blue and green stone, and chunks of granite with creases around the center, which we afterwards found to be stone hammers, made of granite and very hard. I took some of the blue or green stone, after pounding it up, to an assayer who was running the Mineral Park mill; he assayed it—with no returns. I sunk the shaft a little deeper—found nothing; so let it go. A short time after I learned of some one finding turquoise over that way. I went over there and, lo! in the same old shaft that was sunk by the soldiers and ancients, were men at work. They had the ground located; the men working there were from New Mexico; they worked a little while, went away and did not come back. In due course of time the ground was subject to location. I then located it and went to work. Some men would come along, and, seeing me at work on nothing, would say: 'Crazy!' I got a few pieces of the stone and sent it to Tiffany of New York. George Kuntz, his expert, declared it was all right, but would be better if it was gone down on farther. I went down a little farther, with no good results, and, having no money, I quit it, but did not abandon it. I prospected east of it on the hill and found several old shafts that were sunk by prehistoric miners; beautiful pieces of blue stone, with others, all over that section; I picked up several pounds; sent some to France, Germany, Switzerland, England and Belgium. From nearly all I got returns; they would have some fault to find—it was either too light, too dark, too green, or too something, but always with the request to 'send three or four pounds,' and they would 'pay the postage'—but I could get no one to help me develop. It lay idle for two years. I went over there again and found a notice with Sarah Althea Hill-Terry's name on it; but that poor woman never did any work on it. Before the time ran out an individual located it for a Denver, Colo., syndicate; they did about \$50 worth of work and then left it. It lay there idle, nothing done on it, for two years more. I then located it again and went to work. I sent stone to parties north, south, east and west to advertise it. No one wanted it. Finally, a man traveling on the A. & P. R. R. heard of it, came to see me. He had plenty money. (?) He took it to New York, under lease and bond, for \$10,000. I thought \$10,000 would be better to me alive than \$50,000 after I was dead. He got a rich man there interested in it, who put up \$2000 cash—\$1000 the promoter was to pay me on the lease and bond and \$1000 for his expenses going and coming from New York. The schemer came out here, gave me \$500 and kept the \$1500 and went God knows where—and he is there yet. I believe his conscience had stricken him or I never would have got a cent; but I treated him kindly, and perhaps he thought I might hurt him up; but he does not dare go back to New York. However, I did not propose that the gentleman who put up the \$2000 should be the loser. I protected his interest, even if I did not get my money. His name was in the lease and bond, of which I had a copy, and, after a dullness of several months, I wrote him. He was surprised to find the position of things and to know the facts.

"After a brief period, another expert was sent out and we did some business. The man who put up the money in the first place is president of the company and I was the manager here, with the above results; but, owing to my other mining interests, I resigned. The company is still working and shipping.

"I send you herewith two photographs—one with the hill in the background. In the one of the other hill you will note the men and tents on top. That has an altitude of 6500 feet. There is turquoise on top of it. There's where we worked in the winter, in about as rough a section as you ever walked over. There was hardly a place big enough for a man to spread his blankets on. I had twenty-five men at work there at \$3 to \$3.50 per day. This is not written for notoriety, but may be of interest to you."

THE International Mining Congress will hold its fifth annual meeting at Butte, Mont., September 1 to 5. Among the contributors of papers to be read and discussed are the following: F. H. Newell, chief hydrographer; W. H. Weed and W. Lindgren, geologists; R. H. Chapman, topographer, all representing the U. S. Geological Survey; Prof. A. T. Holmes, State Geologist of North Carolina and chief of the Mineral Department of the St. Louis Exposition; Prof. E. A. Smith, State Geologist, University of Alabama; Prof. R. B. Fulton, University of Mississippi; C. J. Moore of Cripple Creek, Colo., and others; president, E. L. Shaffner, Cleveland, Ohio; secretary, I. Mahon, Carlisle, Pa.

Gasoline Engine Exhaust Pipe.

One trouble in the use of gasoline engines is to overcome the noise of the exhaust. A contemporary suggests a plan as follows:

The odor of the burned gases is disagreeable, requiring considerable length of pipe to remove them, and increasing the back pressure. The evil of long piping can be overcome by making the pipe large, and with 45° elbows instead of 90° elbows, as shown

in Fig. 1, given herewith. The fewer bends the better.

The end of the pipe should not be below a window or near enough to the ground to annoy pedestrians. An elevation of 10 to 15 feet usually is sufficient. The open end of the pipe never should be placed where dirt or sand can be sucked into the cylinder, with certain damage to the cylinder and piston from grinding by the grit.

Exhaust mufflers are attached when the noise of the explosions is annoying. The construction of the ordinary exhaust muffler is shown in Fig. 3. A dozen perforated cast iron plates are held together by four iron rods. The inner plates are grooved to fit together. When the perforations in the plates have been stopped up by long use or feeding too much lubricating oil, the plates should be taken apart and heated in a wood fire until the grease has been burned off. A barrel loosely filled with bricks makes a cheap and practical muffler. A short length of pipe should extend up from the cover of the barrel.

A drip cock should be placed at the lowest point of the exhaust pipe near the engine, to drain any moisture which may collect in the pipe during the night by condensation, and run back into the engine when it is started.

Fig. 4 shows a pipe with too many turns. When many bends are unavoidable, and the pipe is long, the remedy, aside from making the pipe large, is to put in an exhaust pot, as shown in Fig. 2. An exhaust pot is a large cast iron vessel, placed as close to the engine as convenient and buried in the ground. The larger the capacity of the pot in comparison with the size of the engine cylinder the more effective is it, not only in diminishing the back pressure, but in silencing the noise of the exhaust.

Never lead the exhaust pipe close to wood or other material likely to ignite, as the pipe sometimes becomes hot enough to char, and may start a fire.

Platinum.

Washington advises as to the effect that a report upon the production of platinum in the United States in 1901 has been prepared for the United States Geological Survey and will shortly be published. The output during the year aggregated 1408 ounces of crude platinum valued at \$27,526, as compared with 400 ounces valued at \$2500 in 1900. The production for 1901 is the largest since the statistics have been compiled in 1880.

"The supply of platinum in the United States in recent years has been obtained as a secondary product from gold placer deposits in Trinity and Shasta counties, California. The occurrence of the metal has been reported in many other gold placers of California as well as in Washington, Oregon, Idaho, Montana and Alaska, but the deposits have not been sufficiently rich to place the extraction of the metal on a profitable basis, although eventually in the States named it is thought it will be developed in larger quantities.

"The most noteworthy feature of the platinum industry in the United States during 1901 was the discovery of the metal in the copper ores of the Rambler mine, near Encampment, in the Medicine Bow mountain, of Albany county, Wyoming.* As a result of this discovery the Survey calls attention to the im-

*See editorial note, page 99.

portance of examining all copper ores for metals of the platinum group.

"The imports of platinum during 1901 were valued at \$1,695,895, as compared with \$1,762,020 in 1900. The world's annual production of platinum for the last few years has ranged between 160,000 and 170,000 ounces, of which, as far as can be ascertained, Russia supplied at least 150,000 ounces, the remainder being obtained mainly from South America.

"During the last two years the price of platinum has steadily advanced from its lowest point in 1895 of \$10 an ounce to \$21 per ounce, which was reached in the latter part of 1901. The demand is in excess of the supply, and it is believed the price will continue to advance."

The Edwards Air Pump.

The Edwards air pumps are of a unique construction. It will be seen from the illustration that the Edwards air pump uses no induction valves, either in the suction chambers or in the pistons, this form of air pump being known as the suction valveless type, the only valves being in the discharge plates, where they are readily accessible. In the action of the Edwards pump, the condensed steam flows continuously by gravity from the condenser into the base of the

pump, and is there dealt with mechanically by the conical bucket working in connection with a base of similar shape. Upon the descent of the bucket the water is projected silently and without shock at a high velocity through the ports into the working barrel. The rising water is followed by the rising bucket, which closes the ports, and, sweeping the air and water before it, discharges them through the valves at the top of the barrel.

In this pump the speed of the water corresponds to the speed of the bucket, and the pump, having a small and regular quantity of water to deal with at each revolution, is designed to work at high speeds.

In the design of these pumps clear air inlets are

maintained through the mechanism, as herewith shown. In the Edwards pump the question of satisfactorily dealing with the air is considered as of primary importance. Under ordinary working conditions, when the bucket descends and the ports open, there is no obstruction between the condenser and the pump and the air has a free entrance into the barrel, while immediately afterward the water is injected into the barrel at a high velocity, the intent being that instead of obstructing the entrance of the air, the water tends to compress that already in the barrel, and to entrain or carry in more air with it.

The Wheeler Condenser & Engineering Co. of New York, for whom Chas. C. Moore & Co. are the Pacific coast agents, control the sole rights to manufacture these pumps in America. Chas. C. Moore & Co. say they have put in a large number of these pumps in plants lately constructed on the Pacific coast, and that the results are satisfactory throughout.

Electric Power in Quartz Mining.

At the sixth annual convention of the Pacific Coast Electric Transmission Association in San Francisco C. O. Poole, manager Standard Electrical Co., read a paper on the economy of electric power in quartz mining, which appears, handsomely illustrated, in the current issue of the Journal of Electricity, Power and Gas. Mr. Poole's paper was confined more particularly to mine practice in Amador and Calaveras counties, Cal. A condensation of the article is appended:

The ore in this locality is low grade, ranging from \$2.50 to \$6 per ton. Until recently the source of power at these mines has been steam and water power. The water wheels are working under heads varying from 160 feet to 520 feet. Water power under the last named head, at the prices now charged there, is about equivalent in cost to electric power at \$6.50 per H. P. per month. The uses of power at a mine are varied, and in applying electric power each case is a study by itself. The principal uses consist in driving stamps, concentrators, air compressors, sawmills, blowers, pumps and hoists.

The fuel used for steaming purposes is principally wood and fuel oil. Coal has been used, but not to any great extent. A cord of dry pine wood, which is the variety of wood used in that section, weighs approximately 2000 pounds. Its contents measure 128 cubic feet, of which about 56% is wood and 44% is space. The composition of average air-dried wood, which carries 5000 British thermal units per pound, is as follows:

	Per Cent.
Carbon.....	37.50
Hydrogen.....	4.50
Oxygen.....	30.75
Nitrogen.....	.75
Ash.....	1.50
Hygrometric water.....	25.00
Total.....	100.00

Given the heat units in a pound of wood and the pounds of wood per cord, let us now proceed to demonstrate the cost of steam power with wood for fuel.

A pound of saturated steam at 90 pounds gauge pressure contains 1215 heat units. If the feed water, after passing through an exhaust heater, has a temperature of 150° F., then the actual heat units absorbed by each pound of water evaporated will be 1215 - 150 = 1065 British thermal units. The theoretical evaporation of a pound of water under these conditions will be $\frac{9000}{1065} = 4.69$ pounds, which are the heat units contained in a pound of wood, divided by the heat units required to evaporate a pound of water.

Assuming a boiler efficiency of 65% (which is as good as can be expected when working under variable loads), the actual evaporation under working conditions will be $4.69 \times .65 = 3.048$ pounds of steam per pound of wood. A cord of wood, then, weighing 2000 pounds will evaporate $3.048 \times 2000 = 6096$ pounds of water into steam at 90 pounds gauge pressure.

The ordinary simple non-condensing steam engine will consume 30 pounds of steam per horse power hour, working on unsteady loads. If, then, we divide the total pounds of water evaporated by a cord of wood into the pounds of steam consumed per horse power hour by the engine, we get $\frac{6096}{30} = 203$ horse power hours.

Taking the cost of wood at \$5 per cord, the cost per horse power hour will be $\frac{\$5}{203} = \0.0247 . As there are 720 hours in a thirty-day month, the cost per horse power per month will be $\$0.0247 \times 720 = \17.78 . While it is possible to do somewhat better than this with a plant working under favorable conditions, it will be found in general mining practice that the price is rather above this figure than below it.

Through J. C. Kemp Van Ee of the Royal Consolidated mine, Calaveras county, is presented the results of an efficiency test of a steam plant working

Type of engine.....	Atlas Corliss
Diameter of cylinder.....	14.5 inches
Stroke of piston.....	36 inches
Revolutions.....	.90 per minute
Boiler pressure.....	100 pounds
Terminal pressure.....	23 pounds
Mean effective pressure.....	34.161 pounds
Horse power.....	90
Steam consumed per horse power hour.....	23.06 pounds

under almost ideal conditions. The plant in question is driving a 40-stamp mill, consisting of twenty stamps weighing 1050 pounds each and twenty stamps weighing 800 pounds each, all with a drop of 5½ inches, making 110 drops per minute. The mill contains twelve concentrators in addition to the mill equipment, and the engine drives a 7 K.W. generator for supplying lights for the mill and houses. The results of this test follow:

EVAPORATION TEST OF SECOND GROWTH PINE WOOD.—Type of boiler, horizontal tubular; size of boiler, 66 inches diameter by 16 feet long; number of tubes, 98 3-inch tubes; heating surface of shell equals 132

square feet; heating surface of tubes equals 1230 square feet; total heating surface equals 2552 square feet; grate surface, 25 square feet; ratio of heating surface to grate surface equals 54.5 to 1; duration of test, 10 hours; amount of wood burned equals 24 cords; weight of wood burned equals 9331 pounds; weight of wood per cord equals 3554 pounds; total water evaporated equals 25,124 pounds; temperature of feed water, 60.8° F.; steam pressure, average gauge, 101.4 pounds; water evaporated per pound of wood, actual conditions, equals 2.693 pounds; water evaporated per pound of wood from and at 212° equals 3.224 pounds; quality of steam, practically dry.

While the test shows an evaporation of 3.224 pounds of water per pound of wood, the results actually obtained in practice are about 12% better than this, as the feed water is heated by the exhaust steam from the engine and enters the boiler at 198° F. Owing to the difficulty of arranging the weighing device for handling the feed water after passing through the heater, we were forced to use cold water, cutting the heater out of service. Adding this 12%, the evaporation is 3.61 pounds of water per pound of wood.

The heat units imparted to the water were $1117 \times 25,124 = 28,063,508$. Assuming an efficiency of 70% for the boiler, the total heat units given out by the wood was $\frac{28,063,508}{70} = 40,090,725$, and the heat units per pound of wood amount to $\frac{40,090,725}{9331} = 4296$, which is about right for that class of wood.

The power cost for running this mill with wood at \$4.25 per cord is as follows:

Fuel cost per horse power hour.....	\$0.0103
Labor cost per horse power hour.....	0.0023
Total.....	\$0.0126

Making the cost per horse power per month amount to \$9.07.

The results obtained from this plant are surprisingly good, but it must be borne in mind that it is a very efficient plant, which is working under the most favorable conditions. The boiler and engine are properly proportioned for the duty, the load is constant, the engine cuts off at the proper point to obtain the best results from the expansion of the steam, and the feed water is heated to a remarkable degree. I think it will be acknowledged that a plant operating under the fluctuating conditions of the average mining load, such as hoists, air compressors, pumps, rock crushers, sawmills, etc., that the consumption of steam per horse power hour will reach from 30 to 35 pounds instead of 23, as shown by the test data above, and the efficiency of the boiler will be below 70%.

A good quality of steam coal yields 13,000 British thermal units by oxygen calorimeter, the approximate analysis being as follows:

	Per Cent.
Moisture.....	3.50
Volatile combustible matter.....	34.27
Fixed carbon.....	51.23
Ash and waste.....	8.00
Total.....	100.00

This quality of coal can be landed at the mines for about \$13 per ton of 2240 pounds. Under the same conditions upon which wood was figured the cost of power, using coal for fuel, will be approximately as follows:

Theoretical evaporation = 12.2 pounds of water per pound of coal. Actual evaporation under working conditions = 7.93 pounds of water per pound of coal, which = 17,763 pounds of steam per ton of coal. Horse power hours per ton of coal = 592; cost per horse power hour = \$0.022; cost per horse power per month = \$15.84.

While this cost appears somewhat less than wood, yet for general mining work wood has many advantages over coal.

We now come to the real competitor of electric power in California—wood and coal having fallen an easy prey; but oil offers a more stubborn resistance, especially in the valleys or at tide water, where it can be landed to the customer at a price of 67 cents a barrel. In the mining districts, however, where the transportation rates are high and oil costs \$1.50 per barrel, it is not such a formidable foe. It is well, however, for the transmission people to keep informed on the oil situation, for oil has come to stay in California.

A barrel of 16° B. oil weighs (allowing for wastage) 330 pounds, delivered; heat units per pound = 18,000; theoretical evaporation = 16.9 pounds; actual evaporation—boiler efficiency—at 65° = 10.98 pounds; pounds of water evaporated per barrel of oil = 3623; horse power hours per barrel of oil = 120.7; price per horse power hour, oil at \$1.50 per barrel, = \$0.0124; price per horse power per month = \$8.93. This result can be obtained under the most favorable conditions.

At the Lightner mine, Calaveras county, electric power has been used exclusively for several years. A 150 H. P. motor drives a two-stage compressor 13x21 inches, 22-inch stroke, and running at seventy-five revolutions per minute. The sawmill, a pump and a blower are also driven by the same motor. The

relief pipe from the air receivers is connected to the steam boilers, two of which act as additional receivers, and another one of them is being used as a reheater. About one cord of wood is burned per day in reheating. There is operated a 60-stamp mill, which is driven by a 100 H. P. induction motor. A 20 H. P. motor drives the rock crusher, and a 5 H. P. motor is used for operating a telpherage system for carrying sulphurets to the chlorination works. All the hoisting is done with compressed air, as is also the lifting of all the water, which is taken from the 600-foot level. In addition to this work seven 3¼-inch drills are supplied with air from the same compressor. The total power bill for January, 1902, was \$1457.50, including the cost of the wood used for reheating purposes, which makes the power cost per ton of ore milled to be 21 cents, including all power charges.

The old Keystone mill, Amador county, consisted of forty 725-pound stamps, 96 drops, 7.5-inch fall, and sixteen concentrators. The total power required was 85 H. P., or 2.12 H. P. per stamp. When this mill was operated by steam, using pine wood for fuel, seven cords per day were consumed. This at \$5 per cord = \$35 per day, or \$1050 per month. Add to this the wages of two firemen = \$1200 per month. The cost of electric power at \$6.50 per horse power per month = $85 \times \$6.50 = \552.50 , showing a saving of \$647.50 per month.

This mill has recently been increased to sixty stamps and twenty-four concentrators. The new stamps are 1000 pounds, making 100 drops, 5.5-inch fall. The mill is now driven by a 150 H. P. induction motor. They have also installed at this mine a 300 H. P. induction motor for driving a two-stage air compressor, and a 30 H. P. motor for operating the sawmill, making a total installation of 480 H. P. This mine is also using compressed air for drills and hoisting.

Measurements made on the Central Eureka mill showed a consumption of 46 H. P. for twenty 850-pound stamps, 90 drops, 6.5-inch fall, including eight concentrators. This is at an average of 2.3 H. P. per stamp. The mill was driven by a 50 H. P. induction motor. Since this data was obtained the owners have increased the capacity of the mill to forty stamps, and have installed a 100 H. P. motor to drive it. Preparations are now being made to install an air compressor, to be driven by the 50 H. P. motor taken from their mill, and when this is done compressed air will be used for drilling and hoisting. The total electrical installation will then be:

	H. P.
Mill.....	100.0
Compressor.....	50.0
Rock crusher.....	12.5
Blower.....	7.5
Total.....	170.0

The Oneida mill is running sixty 1100-pound stamps, 94 drops, 7.5-inch fall. The power required to run the mill, including thirty concentrators, is 175 H. P., or 2.91 H. P. per stamp. The stamps are driven by a 150 H. P. induction motor, and the concentrators are driven by a 30 H. P. motor. This mine is also using a 50 H. P. motor on its rock crusher, a 75 H. P. motor in its sawmill and a 125 H. P. synchronous motor driving its air compressor. It is preparing to install a 125 H. P. motor in the mine for driving a pump, which will make a total installation of 555 H. P. The total power cost per ton of ore milled at this mine is about 30 cents. The cost of power for the mill when all the stamps are run continuously is \$1137.50 per month. This mine is hoisting and pumping by steam, with oil for fuel.

Mr. Poole's article is considerably condensed, the intent here mainly being to produce the figures and detail, which are always of interest to mining men.

THE pumping station of the Butte Water Co. at Divide, Mont., pumps water from the Big Hole river to a reservoir 800 feet above, from which it is conducted through 28 miles of pipe to Butte. From low water in the river to the level of the inlet chamber at the South Fork reservoir is 787 feet. The addition of the friction head for the full capacity of the line gives 840 feet as the total dynamic head. This pressure, while not unusual for mining or oil line pumps, is greater than can be found in any water works plant of equal capacity. The water is taken from a stream flowing into the Gulf of Mexico, carried across the crest of the continent, and delivered on the banks of a tributary to the Pacific.

Work on the Central Pacific Railroad cut-off across the Great Salt Lake, Utah, is proceeding rapidly. On the Ogden side the roadbed has been finished for a distance of 8000 feet out into the lake and the track laid. After going 2000 feet farther the driving of piles for the trestle across the deep part of the lake will be commenced. Ten pile-drivers will be used for the work.

A LOAD of 8440 net tons of iron ore is the record made by the schooner John Smeaton, sailing from Duluth, Minn., August 5. The previous greatest steamer record was 7417 gross tons.

Mining and Metallurgical Patents.

Patents Issued August 12, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ELECTRIC METER.—No. 706,612; Elihu Thomson, Swampscott, Mass.

In an electric meter, retarding magnet system comprising one or more magnets producing substantially constant magnetization and electromagnet, winding of which is connected in meter circuit, magnet being so proportioned that at or near full load its magnetization will become substantially constant.

FLUID PRESSURE OPERATED TOOL.—No. 706,688; J. V. W. Reynders and W. T. Sears, Harrisburg, Pa.

Combination of drill or other tool with feeding device therefor, comprising cylinder having within it piston, liquid reservoir, means for subjecting liquid in reservoir to pressure of elastic fluid, means for operatively connecting liquid reservoir and piston cylinder whereby liquid under pressure of fluid may be caused to act upon one side of piston to move it in one direction, with means for connecting portion of cylinder on other side of piston with source of fluid under pressure, whereby piston may be moved in opposite direction, tool being free to turn independently of piston.

ORE ROASTING FURNACE.—No. 706,756; D. C. Jackling, Republic, Wash.

In ore roasting furnace of class described, combination of ore roasting hearth, pair of tracks arranged parallel with and outside of hearth, cooling

hearth arranged parallel with and above ore roasting hearth, pair of tracks arranged parallel with and outside of cooling hearth, plurality of rabble trucks provided with rabble mechanism for agitating moving material along both tracks, pair of link belts connecting rabble trucks together in continuous manner, plurality of shafts provided with sheave and sprocket wheels for holding and driving pair of link belts, pair of side blocks supporting one shaft, countershaft connected with one shaft to transmit power and motion thereto, means for driving countershaft, shipper mechanism for throwing driving means into and out of engagement with driving shaft, weighted chain or similar element connected with side blocks to hold link belts under tension and, should either or both belts break, contact shipper mechanism and disengage driving means from countershaft.

FUEL VALVE FOR GAS ENGINES.—No. 706,916; J. B. Fenner, Buffalo, N. Y.

Combination with cylinder and piston therein, of chest arranged at end of cylinder having valve chamber communicating with cylinder, socket extending from outer side of chest into valve chamber, fuel conduit opening into side of socket; valve case fitting in socket having ports in side which communicate with fuel conduit; hollow rock valve arranged in case having ports in side which register with ports of case opening at its inner end into valve chamber of chest.

DRILL ROD GRAB.—No. 706,872; J. H. Adams, Fullerton, Cal.

In drill rod grab, combination with outer casing, rigid jaw secured therein provided with plurality of teeth, coinciding sliding jaw arranged adjacent rigid jaw provided with teeth, collar on upper end of sliding jaw, guide pin projecting from collar, spring surrounding pin adapted to bear against collar to retain sliding jaw normally against upward movement.

ORE CONCENTRATOR.—No. 706,793; H. S. Bailey and W. E. Wild, Denver, Colo.

In ore concentrator and separator reciprocating,

concentrating table provided with plurality of concentrating surfaces of equal lengths in step form, each stepped concentrating surface comprising inclined reservoir section and inclined ore washing classifying section, sections being arranged to intersect one another at points intermediate of ends of stepped concentrating surfaces, raised ridge or dam at point of intersection, concentrates passage past dam arranged to connect lowest portions of inclined surfaces with one another, pocket in lowest side of inclined surface at and adjacent to head end of table blending into concentrates passage having dams arranged and adapted to guide concentrates from reservoir section away from dam below and in substantially different direction from that in which ore pulp flows, having dams arranged across table in any suitable direction.

MEANS FOR UTILIZING COMPRESSED AIR.—No. 706,653; E. Hayward, Chicago, Ill.

Combination with steam boiler of double-acting air compressor, means for actuating compressor, pipe connected therewith adapted to deliver compressed air to dome of boiler, means for heating compressed air before delivery in dome, comprising coil in pipe located in and transversely of furnace of boiler valve in connection acting to regulate flow of compressed air to boiler.

Mustard Gold.

In connection with the mention in the issue of Aug. 2 of mustard gold being an indication of the existence of telluride, the question is asked simultaneously by three Montana and two Arizona subscribers: "What is mustard gold?"

A. G. Holroyd, speaking of finding telluride of gold in Kalgoorlie, Australia, says:

"This peculiar form of gold, resembling clay, was first brought under my notice in 1894, while acting as manager of the Austral Otis Metallurgical Works in South Melbourne. It came from the Hannans Star G. M. Co., and I was told it occurred in a vein varying in width from a pencil line to half an inch. Upon examining this clay-like gold under the microscope I found it consisted of the minutest particles, rounded globules, and filigreed, conglomerated together, resembling a sponge filling up similar shaped cavities and veins to those occupied by the telluride of gold in the sulphide ores. If this sponge gold is pressed with the blade of a knife (being exceedingly soft and malleable) its metallic luster is at once apparent. This mustard or clay-like gold can be artificially obtained in the laboratory by dissolving a piece of telluride of gold with sulphuric acid very slowly. The tellurium is leached out, and leaves the gold in an exactly similar form to that which is found in nature here upon this field. This, among other reasons, led me to conclude that the mustard gold in a mine here is an indication of the presence of telluride of gold at depth. The greater quantity of gold ores on the Kalgoorlie field carry mustard gold, and in most cases telluride of gold has already been found, in many cases very rich and in solid, hard country. I mention those mines in which I have already proved the presence of tellurium and those in which my experiments have proved to me that it will occur, and from the names mentioned it shows that telluride of gold is generally distributed throughout the field, and will be the eventual mainstay of the field.

"Another class of gold, 'sponge gold,' resembling mustard gold, but more spongy in appearance, having also a beautiful metallic luster, occurs upon this field. It resembles the most beautiful filigree work. This gold was found in large quantities in stoping from the 200-foot level to the 150-foot in the Great Boulder, and as much as seventy pounds of pure gold was obtained in one bunch of ore. This gold is also due to the oxidation of the tellurium, and at a depth large quantities of telluride of gold should be found. Under the microscope this gold presents the appearance of a mass of gold crystals (octahedron and dodecahedron), with brilliant faces and gold in filiform and arborescent shapes. There are evidently several other forms of tellurium besides calaverite—sylvanite, krennerite and native tellurium are among the number."

GAS ENGINES using blast furnace gas are to be built to supply blast to four of the new furnaces which the Lackawanna Steel Co. is building at Stony Point, near Buffalo, N. Y., the first example of this practice in the United States.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

The Nome Exploration Co. has bought of Cooper & Lane nine claims on Newton gulch, near Nomo, for \$30,000. The Nome Exploration Co. and the Pioneer M. Co. together have bought the Sugar claim, between Anvil and Dexter creeks, for \$50,000.

ARIZONA.

COCHISE COUNTY.

The Copper Buillon M. Co., at South Pass, is about to ship ore; a new working shaft will be sunk. The lower shaft begun some time ago will also be sunk. The main tunnel is in 1000 feet; about 3000 feet of work has been done.

At Willcox, the Old Terrible, a 20-stamp mill, capacity ninety tons per day, is in operation. The machinery will be run by a 100 H. P. Corliss engine; fuel, crude oil. The 60-ton smelter is expected to be in operation by October 1st. The ledge runs from 1 to 5 feet in width and carries gold, silver and lead values; average, \$28 to the ton.

The Copper Hill M. Co., Canada del Oro, 4 miles from Oracle, will put in a leaching plant, 100 tons daily capacity, and will build a traction engine road from the mine to Red Rock station, 24 miles. They have about 10,000 tons 5% carbonate and silicate ore blocked out.

F. L. Wright, superintendent of the Bisbee West, will put on next month seventy men. He is preparing to sink the main shaft to the 1200-foot level. There are 2000 feet of development work upon the property. The pump has a capacity of 200 gallons per minute.

J. G. Hearne, manager Black Diamond M. Co., in the Dragon mountains, near Tombstone, says the new smelter, 200 tons capacity, is completed. A gravity tramway 1½ mile long, to connect the mine and smelter, will be finished Oct. 1. The Black Diamond is a tunnel mine 800 feet higher up the mountain than the smelter. The tramway will be run from the lower of the four principal tunnels, which are all connected by winzes. The ore will travel by gravity from the stopes to the smelter.

GILA COUNTY.

P. J. Cole, superintendent of the Columbia Copper Co., has returned to Globe and work is to be resumed on the property.

A. C. Sieboth, at Queen creek, is having development work done on the Golden Eagle mine.

T. Kavanaugh, foreman of the Troy-Manhattan Copper Co., tells the Silver Belt that development of the properties at Troy is being carried on with seventy miners.

GRAHAM COUNTY.

The Shannon C. M. Co., near Clifton, has an output of about eleven tons of copper per day. The company employs Mexican labor and pays \$2.50 per day—an advance of \$1.

Supt. Molder of the Home C. Co., near Clifton, has 40 feet of gold ore which he says will average \$4. It is the company's intention to continue development and as soon as possible to build a stamp mill.

T. McNery, now at Pima, has a plan to drive a tunnel into Graham mountain at an elevation of 350 feet to develop water and minerals. Surveys have been made; the distance through is estimated at 12 miles. The company which proposes to do this is the Triumph Tunnelsite Co.

MARICOPA COUNTY.

Phoenix reports work progressing at the Rich Hill shaft of the Electra M. & M. Co., now 180 feet deep. The company now controls 4000 feet along the dike.

The News-Herald has from a reliable source that the proposed railroad from Congress Junction to the Colorado river will be built, and that it will be in operation during the year 1904, to be part of the Phoenix & Eastern Railway system. Ground will be broken during the next thirty days. The Phoenix & Eastern proposed route is between Phoenix and Benson, where it is expected that connection will be made with an Eastern trunk line. From Phoenix the tracks of the S. F. P. & P. will be used, under lease, as far as Congress Junction. From that point the western end of the system will run to the Colorado river, near Ehrenburg.

Sanders & Upton have bought the interests of C. F. Hathaway in the Angel and Arizona Bess mines, near Wickenburg.

At Phoenix the El Oro Dredging Co., S. B. Connor, A. S. Grant, W. S. Noyes of California; Wabash Con. M. Co., L. M. Goddard, W. C. Calhoun, F. C. Noble of Colorado; La California M. & M. Co., L.

Russell, F. S. Mallory, B. R. Ragland, have filed articles of incorporation.

MOHAVE COUNTY.

S. C. Bagg, manager New Comstock M. Co., Kingman, tells the Miner that in the drifts now being driven on the Catharine mine a new ore phase is developing. The ore heretofore has been gold-bearing entirely, but the new ore carries 100 ounces silver and \$50 gold to the ton.

PIMA COUNTY.

F. M. Hartman, manager Catalina Copper Co., upper Canada del Oro, has fifteen men doing development work. The ore on the dump averages 6% copper, \$2 gold and \$5 silver. The other mines in the Canada del Oro are not working at present. At Copper Hill the company is contemplating the erection of a leaching plant. The mines at Camp Condon will resume this fall.

SANTA CRUZ COUNTY.

The Copper Queen Co. is having 4,000,000 brick made at the rate of 48,000 a day at the yard, 12 miles northeast of Douglas.

YAVAPAI COUNTY.

Near Prescott the Anita M. Co. has the George process for treatment of copper carbonates; \$11,000 worth of machinery will be put in. The company expects to have 125 men at work.—The details of the transfer of the Cameron group to the Pages have been completed; a smelter is to be put in.—The Alma mine, Groom creek, has fifteen men employed in development.—On the 400-level in the Home Run mine, Groom creek, a vein of ore 2½ feet wide is struck, which carries \$30 per ton gold.—Superintendent A. J. Pickerd is running the Chicago mill. He has twenty-five men on the President.

W. D. Powell, general manager Black Rock G. & C. M. Co., will put machinery on the company's group of claims near Jerome.

Superintendent M. Bradley of the Lion G. M. Co., operating and developing the Bardshear mines on Cherry creek, is down 247 feet in the old shaft, having crosscut the ore shoot for that distance, and is sinking a new shaft which pitches with the vein and is down 170 feet from the surface. He has ore assaying \$20 per ton, quartz containing sulphides and brown hematite of iron.

In the trial run of the Aiken furnace at the United Verde mines it was worked for about six hours, when it was shut down. The trial was made on the gray copper ore as it was taken from the mine. Whether or not all the values will be saved remains to be seen after a more thorough test. The principal advantage claimed for the Aiken is that it melts ore without having to send it to the roast first; heat is supplied by oil.

A. Thorbecke, of Jerome, at Banning creek has six claims, the main ledge 3 feet wide; ore averages \$15 gold per ton.

The machinery for the concentrating plant of the Standard S. & R. Co. is at Val Verde, ready to be put in place; daily capacity, eighty tons. A 10-stamp mill to handle the free milling ore will be run in connection with the concentrating plant. The company has ore awaiting treatment.

The Morning Star group, 8 miles east of Jerome, is being developed. The ore runs 7% copper.

Prescott reports a 21-pound gold brick from the Braganza Co.'s Henrietta mine, the second cleanup from the mill, running on Henrietta ore. The company has fifty-five men at work, has ample water and is running its mill steadily. The new shaft is over 300 feet deep.

M. S. Taft of the Victor mine, near Walker, reports the working shaft down over 300 feet, the ore averaging \$20 gold per ton.

W. J. Martin, superintendent Monarch M. Co., is working the Mocking Bird group, Cherry Creek district, and sinking a 500-foot shaft on the ledge. About 40% of the ore is free milling.

A rich strike is reported in the First Home mine of the Merchants M. Co.

The Val Verde smelter is making matte steadily.

C. Timmons has the double-compartment shaft on the Copper King mine down nearly 300 feet. A 25 H. P. gasoline hoist is in operation.

The Yavapai Placer Mines Co. is pushing work on the properties near Lynx creek.

The Sultan mine is taking ore from a vein 3½ feet wide which averages \$20 a ton. The Big Bug G. & C. M. Co. has the double-compartment shaft on the company's property down 200 feet. Forty thousand gallons of water a day has been pumped from the mine.

G. P. Harrington, manager Tiger Gold Co., at Crown King, has men developing the Ora Bella group and has large bodies of sulphide ores of a concentrating character.

The Last Chance, Thumb Butte district, is being worked by E. A. Haggott,

who is sinking a 500-foot shaft and putting the mill in order.

The Federal M. & M. Co., in the Cherry Creek district, will develop its property at once. The company has in a 30-foot shaft and tunnel a ledge which averages \$30. A mill will be put up.

W. A. Clark of Montana arrived at Jerome on the 17th. The United Verde mine is still on fire. Four levels are now burning. A Chicago man is at work with an apparatus designed to check the further progress of the fire, while it is said to control and extinguish fires in the upper levels. Several hundred men have been laid off on account of the shutting down of the mine and smelter.

YUMA COUNTY.

At Yuma, M. Nugent from Kofa, has a \$50,000 gold brick, representing the past thirty days' cleanup of the King of Arizona, which he brought in for shipment.

CALIFORNIA.

AMADOR COUNTY.

At the Hoffman mine, owned by W. F. Detert, a tunnels being run to tap the ledge at a depth of 1400 feet.

The Del Monte tunnel was advanced during July 80 feet; the entire length of this tunnel up to Aug. 1st was 243 feet.

J. F. Parks, superintendent Kennedy and South Eureka mines, tells the Jackson Dispatch that exploration work is in progress on the 2400 and 2500 foot levels from the East shaft. In the main shaft at the South Eureka mine a depth of 250 feet below the 2000 foot level has been attained. The mill is busy on rock from the levels of the 2000-foot station.

In the Onaida mine Superintendent Hampton has the pump in operation at the 1300-foot station, run by a 100 H. P. direct-acting electric motor. There are six double-acting plungers; the pump forces 200 gallons of water a minute 1300 feet to the surface. A tank has been cut into the solid rock, 80 feet in length, 22 feet wide and about 8 feet high, which will hold 105,325.6 gallons water. A station is being cut at the 2000-foot level, and a smaller pump will be put in there to raise the water that accumulates in the tank. As soon as the station is cut and the preliminary work completed, sinking will be resumed and the shaft put down several hundred feet lower. Forty stamps in the mill are kept busy dropping on ore from the 1200, 1400, 1800 and 2000 foot levels.

The Rhett Con. G. M. Co. has its mill at the Bay State mine running on good ore from the 850-foot level, north. Development work is being prosecuted on the Bay State and Kretcher veins. The south drift at the 850 Bay State vein is in over 450 feet, its face being in sulphurets. At the 700 Kretcher vein a drift is being run north on the vein and a raise put up in the ore. The management hopes soon to sink a new vertical shaft on the Rhett mine, south of the Bay State.

BUTTE COUNTY.

The Golden Trout mine is 35 miles from Oroville. A stamp mill is in operation on ore from the Birmingham drift.

CALAVERAS COUNTY.

W. C. Potts, superintendent Sierra Railway, says the railroad will open for passenger traffic between Angels and Jamestown Oct. 1.

EL DORADO COUNTY.

In the Mt. Hope mine, Grizzly district, at a depth of 225 feet, is found a body of ore.

INYO COUNTY.

The Golden Argus M. & M. Co. is operating in Snow's canyon, about 20 miles from Ballarat, and is putting up a 5-stamp mill. They will put in concentrators and a cyaniding plant.

KERN COUNTY.

The Little Butte mine, near Randsburg, has resumed. P. H. McMahon, superintendent Butte Lode and general manager Con. M. Co., has charge.

The Oil-Well Drillers' Union of California is organized for the purpose of making a uniform scale of wages in the field. About a year ago drillers received \$7 to \$8 per day; now they are receiving from \$4 to \$5. The union will probably include 250 men.

The Standard Oil Co. has ordered twenty more 35,000-barrel tanks for Kern river, making eighty-five tanks, with a capacity of 2,975,000 barrels. The Southern Pacific is placing seventy-two of these tanks at various points along its lines.

The Gold Peak group of gold mines, near Bakersfield, has been acquired by W. F. Snyder for the Western Exploration Co., of which he is president and manager. Superintendent Rader says to secure the Gold Peak \$200,000 was required, and of this the final payment has been made by Manager Snyder.

MARIPOSA COUNTY.

Surveys are being made for the new electric power plant to be put in on the

Merced river, 15 miles above Coulterville, and will be completed next November. During the following season a dam of masonry will be constructed. The fall of water will be 300 feet and the ditch 9 miles long. Electric power will be developed for the operation of mines in that section and also for sale to consumers in the valley. It is a \$1,000,000 proposition.

MONO COUNTY.

In the Standard Con. mine at Bodie, for the week ending August 9, at the mill 427 tons of ore were crushed; average assay vanner tailings, \$5.83; concentrates produced, 1.40 ton; assay value, \$151.10; amalgam produced, 1553 ounces; assay value, \$2.44 per ounce.

NEVADA COUNTY.

Work on the Pennsylvania resumed on the 18th. About twenty-five men were put on. Superintendent B. Ople hopes to increase the number later.

L. I. Ogden will build a mill at the Pine Hill mine, near Wolf.

Near Grass Valley, on the 19th, fire destroyed the plant of the Conion M. Co.; loss, \$20,000; insurance, \$5000. The mine is owned by Eastern men principally and employed twenty-five men. It had a complete plant and was just beginning to make money for the stockholders, after two years' hard work in exploring. Next week they would have started to sink 1000 feet.

J. D. Huffman has returned to San Francisco, after ore sampling the Pennsylvania mine. The result of his estimation will be placed before the commission appointed to decide the damage suit of the Pennsylvania against the W. Y. O. D.

PLACER COUNTY.

At the Gold Reef mine, at Shady Run, T. H. Wilkins has a pay streak 50 feet from the main tunnel, and has since cross-cut it 140 feet. He is blocking out the pay streak and next month will be breasting. While tunneling in the placer mine a free-milling gold quartz vein was cut through. A stamp mill is projected.

Superintendent F. Schulze, at the Big Hill mine, Canada Hill, owned by the Golden West Con. M. Co., has men at work in the lower tunnel into the channel to drain it. The 1100 feet to reach the channel can be done by Jan. 1, 1903.

PLUMAS COUNTY.

M. C. Miller of Minneapolis, who owns the Miller quartz mine, has bought of J. O. August the Mill creek gravel and quartz property, 2 miles south of Quincy.

SAN BERNARDINO COUNTY.

An option on the Brick Consolidated at Vanderbilt has been secured by W. B. Thompson of Utah.

SHASTA COUNTY.

Conflicting statements come from Redding as to whether the Balaklala copper claims, adjoining the Mountain Copper Co.'s property, have been bought or not. For some time H. Spence has been operating a battery of diamond drills by which the Western Exploration Co. has been prospecting the Balaklala group under a \$750,000 option, and with satisfactory results. The statement has been positively made that the deal was a go, that the money was to be paid and that the new owners would immediately develop on a scale commensurate with the extent of the deposit. But the Searchlight says:

"The Kimberley syndicate which holds a bond on the Balaklala group of copper mines, near Kennet, has folded its tent like the Arab and as silently stolen away. All of the diamond drills and other prospecting apparatus were shipped at Kennet en route to the State of Nevada. Development work at the mines was suspended a week or ten days previous to shipment.

"Several explanations have been advanced as a reason for the withdrawal of the Kimberley people the most plausible one being the inability of the various copper mining companies to get together on a common basis, which would mean a single smelting management and other economies necessary to profitable production at prevailing copper prices.

"Several fruitless attempts have been made to merge the greater undeveloped properties on the copper belt with the Bully Hill mines and to utilize a common plant on the Sacramento river near Kennet, and it was understood in well-informed circles that nothing would be done toward production until a merger of various interests could be arranged. It would now appear that this information was well founded.

"An unconfirmed report is in circulation that there has been a transfer of interests and that another company will take up where the Kimberley syndicate left off. The Kimberley bond on the Balaklala called for payments aggregating \$650,000."

It is believed, however, that the deal will go through, ultimately, and another big producing copper property be added to Shasta's mining enterprises.

The Bliss mines on Squaw creek are to

be worked again. C. C. Bush is agent at Redding.

SIERRA COUNTY.

The Taber G. M. Co., San Jose, S. P. Hatcher secretary, at Gibsonville, has a development of 3700 feet of tunnel work and has struck the ancient river channel.

SISKIYOU COUNTY.

J. E. McBride, who owns a mine in the Humboldt district west of Yreka, will put on a 5-stamp quartz mill.

At Hornbrook the Jillson mine is in operation. Mattern's 10-stamp mill is about completed. Manager Williams will crush ore from the Indian Girl mine in the new mill.

The Carlock & Morrison quartz mine, in Quartz valley, is paying; thirty men are employed. Being a blanket ledge, it is more difficult to get the quartz out. The Punch Creek quartz mine, on Humboldt, yields good returns. A 3-foot ledge in the new tunnel keeps the McCook mill running day and night crushing ore.

The Journal hears that the dredger in Yreka creek is taking out considerable gold—\$1000 being realized in five days.

SONOMA COUNTY.

J. E. Heald has bonded the Rainbow copper mine, near Cloverdale. The Shasta County M. Co. will take hold of the property and develop it; price, \$50,000—\$3000 to be paid in sixty days, the remainder in installments running over a period of two years, development work to commence within sixty days.

TEHAMA COUNTY.

There is a deposit of sulphur 50 miles east of Red Bluff, between Battle Creek Meadows and Morgan Springs, which is just located by W. M. Smith and others of Red Bluff.

TRINITY COUNTY.

At the Globe mine, near Dedrick, Superintendent Skinner has twenty men employed.

At the Brown Bear mine, at Deadwood, sixty men are employed.

TUOLUMNE COUNTY.

The Jumper Gold Syndicate, a British corporation, has brought suit against P. G. Gow, late manager of the syndicate Jumper and New Era mines, for an accounting.

Near Jamestown, the machinery for the new 10-stamp mill of the Republican mine is on the ground. A contract to sink the shaft to the 600 level has been let. The stamps in the old mill are dropping on good ore.—The Meighan G. M. Co. has incorporated; J. M. Meighan, F. M. Leland, J. P. James, H. Sussman, W. G. Luckhardt.

At the Bell mine, near Tuttle town, the shaft, 400 feet in depth, is being retimbered and will be sunk 200 feet deeper. A new gallows-frame is to be erected.

At the Hunter, or New Era mine, ten men are sinking.

W. H. Martin will work the Lady Washington. The tunnel is in 90 feet; an air compressor is to be installed and a pipe line run.—The Dreisam shaft is down 400 feet.

C. W. Gammon has deeded to the Eclipse G. M. Co. the Markham mine.

Peterson & Ogden have sold to Murphy & Davis the Telephone quartz mine, 5 miles from Columbia.

COLORADO.

BOULDER COUNTY.

Near Eldora three groups—the Revenge, New Eclipse and Kittie—have been consolidated under the control of the Revenge Development Co., which owns twenty claims showing mill assays of \$8 in gold. They intend to drive a tunnel from a point 75 feet above Boulder creek in the main Boulder canyon 6000 feet into Bryan mountain, cutting these claims at a depth of 600 to 900 feet.

The Enterprise mine, on Spencer mountain, under the management of J. Phillips, is producing ore running \$35 per ton.

Boulder reports that W. Brainard, driving the Alaska tunnel, near Ward, has opened in the heading, 1800 feet from the portal, a body of sulphide ore, carrying \$69 per ton in gold and associated values. Ex-Secretary of the Treasury Lyman Gage, who is interested in the property, was present when the strike occurred.

CLEAR CREEK COUNTY.

At Yankee Hill the Alice mine is being operated by the Silver Creek M. Co.; manager, M. Hackett.

Near Georgetown, the Mendota mill is now ready for continuous operation.

The mineralized seam continues in the Burleigh tunnel.

At Idaho Springs the Gold Cord M. & S. Co. has bonded the Leap Year lode.

CUSTER COUNTY.

G. B. Raymond, manager Toledo mine, near Rosita, has assays of ore showing values in gold, silver and 10% copper.

FREMONT COUNTY.

The U. S. R. & R. Co., Colorado

Springs, will put in eighteen roasting furnaces at its zinc and lead works at Canon City, which is being overhauled and repaired. The improvements will cost \$100,000; the capacity of the plant is being doubled. The smelter will be ready for work October 1.

GILPIN COUNTY.

It is locally stated that the Carpenter smelter at Golden has been turned over to the trust and that the latter will handle the ores from the Saratoga and the Stevens group of mines, now being treated at the Golden plant. F. H. Carpenter says that if the trust is to operate the plant he knows nothing about it. He has received no intimation of any change. The plant is owned in Detroit; he has been in charge. Dr. Carpenter says:

"So far as I know, there is nothing to the report. It is one of those which break out every once in a while. The smelter is absolutely free from the trust in every respect. We are only selling, to them the matte which is our product. The relations existing between our company and the American S. & R. Co. have always been pleasant. The Golden plant was erected primarily to treat the ores of the Saratoga mines, and not for general custom work. It was not our intention to compete with the local mills, which can treat certain ores to better advantage than we can, especially those high in silica. The Golden smelter is not now, nor has it ever been, to my knowledge, for sale. After its erection we found that we could buy and treat certain ores to advantage. This we continue to do. Ores not carrying lead can be shipped any day to the Golden plant. It has never been closed for the receipt of ores a day since it was first opened."

The local paper asserts that the capacity of the smelter is to be doubled at once and the contract given to J. M. Thexton of Idaho Springs.

Manager J. Dickey of the Hidee G. M. Co. intends sinking the shaft 200 feet further. The shaft shows a small streak of gray copper and iron ore. The property has a gasoline plant.

Superintendent M. Lewis at the Mackay-Burroughs property on Quartz hill is making regular shipments.

GUNNISON COUNTY.

At Gunnison, Crymble & Son have men at work on the David H., in the Tomichi district. The vein is 5 feet across and assays thirty-six ounces in silver and 34% lead to the ton.

The Good Hope mine, Vulcan district, during the past few weeks has shipped from the fifth level \$60,000 worth of ore while the mine machinery was undergoing repairs and a full force was not employed in the mine. Some of the ore runs as high as \$1000 in gold to the ton.

Superintendent H. Miller has made a strike in the Hard Cash lode on Galena mountain in the north end of the county.

J. G. Bolmer and N. M. Clemmens of St. Louis, president and secretary of the Copper Queen M. Co., are at the company's property in Copper Queen basin, north of Crested Butte. They contemplate considerable work.

LAKE COUNTY.

(Special Correspondence).—The R. A. M. Co. are shipping forty tons of lead sulphide ores per day to the smelter. They are also shipping some zinc ore to Gas, Kan., and if the experiment proves successful it will undoubtedly lead to a good market for zinc ores.

A. A. Bernard & Co., who have been leasing on the Vanderbilt mine the past four years, have closed down indefinitely. Leadville, Aug. 15.

(Special Correspondence).—Dr. J. H. Heron of Leadville is installing a hoisting plant on the Clover mine, at the foot of Ella hill, and will sink a shaft on the property.

The Two Bit G. & C. M. Co. of Leadville, operating in Two Bit gulch, 11 miles south of Leadville, have sunk a perpendicular shaft 350 feet and drifted 90 feet across to the vein, striking the vein below the lower workings in the incline. They are working twelve men. The ore averages 3 ounces in gold, 200 ounces in silver and from 15% to 40% copper.

Leadville, Aug. 14.

(Special Correspondence).—The Bartlett tunnel, on Mt. Elbert, 15 miles from Leadville, is being operated by the Twin Lakes G. M. Co. The company owns about 200 acres of ground and for the last six years has been driving a tunnel to tap some of the veins and porphyry dikes that are so numerous on the surface of the mountain. Last fall they cut the first vein that showed any satisfactory values, and are now in shape to get good interest on their investment. They have a 10-stamp mill and are preparing to add cyanide tanks. A 2½ H. P. gasoline engine runs a blower to furnish air in the 3300-foot tunnel, which keeps a perfect circulation throughout the workings. They have about 750 feet

of ground above the surface where they are now working, but have started another tunnel which will tap this vein, after being run about 4000 feet, at a depth of 1200 feet. The ore yields about \$30 per ton on the plates and gives 2½ tons of concentrates, worth \$40 per ton, per day. Leadville, Aug. 18.

Leadville reports considerable new work this month. The Valentine property is about to resume. Several of the shafts of the Fryer Hill Mines Co. will develop their ore bodies, which have long lain idle. A lease has been given by the Estella M. Co. to G. S. Schlessinger on the Bon Air and Starr shafts, and machinery will be placed at both these properties. The Louisville mine and the President property are resuming operations. The new mill at the A. Y. and Minnie property has started on the low-grade ore of that mine. Preparations are being made to push development on the Valley combination. Ground has been broken for the new concentration mill at the Resurrection property. The old producers of the district continue and the output of the camp at present is about 22,050 tons of all classes of ore per day.

At Leadville, M. J. Murray, manager Ball Mountain & Big Evans M. Co., will sink the shaft another 100 feet.

MINERAL COUNTY.

Creede has shipped between Jan. 1 and Aug. 9, 1902, 2221 cars, 38,534 tons ore. Operations at the Commodore, the largest producer in the district, have been hampered by the non-arrival of machinery ordered some time ago. The United Mines and all properties operated continue to improve as development progresses.

OURAY COUNTY.

Ouray reports regarding the output from the Camp Bird show that the production of the mine from May 12 to June 15 inclusive was 7753 ounces bullion, yielding \$117,549; concentrates shipped, 534 tons, yielding \$40,055; cyanide product estimated at \$14,000; total, \$171,604.

W. B. Sawyer proposes to start the Saratoga mill at Ironton and erect a pyritic smelter. The working of the smelter will bring about the completion of the railroad between Red Mountain and Ironton.

PARK COUNTY.

(Special Correspondence).—W. H. Smith & Co. of Denver have bought the Winrow Co.'s mines and mill through W. J. H. Miller. The Winrow ore is between quartzite and schist and is a carbonate and oxide of iron, highly siliceous. The ore body is 10 to 40 feet thick and can be worked by a system of tunnels. Alma, Aug. 15.

PITKIN COUNTY.

(Special Correspondence).—The Smugler Zinc mill here is commencing work on an addition to the mill, putting in additional machinery for the treatment of slimes. They are adding one large and five small tanks for settling the water that carries the concentrates. Expect to have same in operation in about six weeks. In their mill they use rolled steel tires in their 6-foot Chilean mill and have handled 30,000 tons of ore with one set of working parts which lasted eighteen months. The tires weighed 1400 pounds each; ring die, 2900 pounds. When the tires were taken off they had holes worn through them, also the ring die.

The Hunter Creek M. Co. are operating twenty concentrators, handling about 100 tons per day.

The Mollie mill is only operating part of their mill at present, having closed down when the A. J. mine closed down several months ago.

Aspen, Aug. 17.

PUEBLO COUNTY.

F. Guiterman, of the Western executive committee of the A. S. & R. Co., says the Philadelphia plant, instead of being dismantled or abandoned, will be improved, and that the facts are: That the enlargement of the plants in Utah, Leadville and at Durango is for a time reducing the quantity of ore that has been treated in Pueblo; the amount received at the present time is light, and advantage is being taken of the situation in closing all but four of the furnaces of the Philadelphia plant, in order to install the new machinery.

Following is the log of the Steel City Oil Co.'s well No. 1, which is being bored near Pueblo:

	Feet.
Shale, mixture lime.....	50
Ten-inch drive pipe, 63.6 feet.	
Limestone, white.....	20
Shale, blue, yellow, white.....	80
Limestone, gray.....	25
Sand, gray.....	30
Shale, dark, blue-black.....	75
Limestone, very white.....	40
Shale, blue.....	60
Limestone blue.....	10
Shale, dark.....	60
Limestone, mixture soapstone.....	20

Shale, mixed with sand.....	130
Sand, Benton fossil bed, water.....	10
7½ casing, 729 feet.	
Shale, blue-black.....	150
Shale, very black, strong oil showing.	15
Dakota sand, artesian belt.....	75
5½ casing, 910 feet.	
Shale, blue.....	10
Shale, red.....	45
Present depth.....	1005

SAN JUAN COUNTY.

Silverton reports that all the mines in the San Juan district are working, the strike order which was to have taken effect on the 15th having been recalled upon a compromise satisfactory to the labor union and the mine owners. Much credit is due both factions for the satisfactory way in which the matter was settled. Some mine owners favored shutting down in case the union was stubborn and refused to grant any concessions. A committee from the miners was advised of this fact and conceded the minor requests of the owners. The mine owners in turn made concessions. The scale as finally approved is as follows:

On and after Sept. 1, 1902, for a term of three years, the undersigned will pay the following scale of wages to their employees:

WORK UNDERGROUND.

Miners.....	\$3 00
Machine men.....	4 00
Machine men helpers.....	3 50
Mule drivers.....	3 00
Nippers.....	3 00
Timbermen.....	3 75
Timbermen helpers (whose employed all the time).....	3 25
Hoisting engineers.....	4 00
Station tenders.....	3 00
Blasters.....	3 50
Trammers and shovelers.....	3 00

All the above for eight hours.

OUTSIDE WORKERS.

Engineers.....	\$4 00
Firemen.....	3 50
Both twelve hours.	
Blacksmiths.....	4 00
Tool sharpeners.....	3 75
Blacksmith helpers.....	3 25
Laborers.....	3 00
All nine hours.	
Mill men, battery, Huntington, Chilean.....	4 00
Crushers.....	3 75
Jig men.....	3 75
Table men.....	3 75
Vanners.....	4 00
Tailings plant.....	3 25
Engineers.....	4 00
Firemen.....	3 50
Mill helpers.....	3 25
All twelve hours.	
Crushers.....	3 25
Mill helpers.....	3 00
Blacksmiths.....	4 00
Blacksmith helpers.....	3 25
Roustabouts.....	3 00
All ten hours.	
Tramway men, grip men and bucket men.....	3 25
Brakemen.....	3 50
Oilers and linemen.....	4 00

All ten hours.
For all classes of labor sinking shafts 25 cents per day shall be added.

For all classes of labor sinking wet shafts another 25 cents per day additional.

Short shift on Saturday for all ten-hour men, short shift to be nine hours.

Nine hours shall be considered night shift for all ten-hour men.

All men to go to and from work on own time.

Rate of wages for all labor not enumerated herein shall be agreed upon between employers and employees, provided that minimum wage scale shall be not less than \$3 per day. All contracts shall be in writing. At the expiration of seven days after beginning work contractors shall have the option to relinquish contract without penalty. Such provision shall be made in the contract. If at the expiration of seven days contractors decide to finish the contract, both parties to the agreement shall use their best endeavors to have the contract completed.

SAN MIGUEL COUNTY.

Men are developing the vanadium deposits in the vicinity of Placerville and Newmire, 18 miles west of Telluride. The company controls forty-five locations, which cover an area of vanadium and uranium. A. B. Frenzel, the discoverer, has been in Europe testing the ore and experimenting with it, and has a contract with firms in Paris and other foreign cities to take the entire output from the properties. A low freight rate has been obtained to transport the product to Galveston. The company has in contemplation a plant for treating the crude product.

The new mill of the Ophir Con. Co., Ophir Loop, will be in operation next week. At the mine two machine drills are opening ground on the Butler and Ida veins. The Ida ore will be put

through the new mill, which is being constructed especially for that purpose, the ore being free milling.

SUMMIT COUNTY.

Mr. Doolittle, superintendent smelter at Robinson, says the new furnace for the smelter is on the way, and will be put in immediately on its arrival.

TELLER COUNTY.

Cripple Creek reports that on the Zenobia two 100 H. P. boilers and a double hoisting plant of machinery, the hoist to be used exclusively for the developments of the levels already started and the other one for sinking the shaft, will enable the company to continue sinking down to 1500 feet depth. Stations have been cut every 100 feet; the levels of the Zenobia are on the level with those of the American Eagle, owned by W. S. Stratton.

O. B. Finn, lessee of the old Brodie mill which was burned on the 10th, expects to save the bulk of the ore that has been precipitated as well as that in the vat. Some 250 tons had already been treated and was waiting to be filtered. An additional 150 tons had been saturated with the primary cyanide solution when the fire occurred. Another 100 tons of crude ore was in the bins.

N. S. Wilson, late superintendent Moon-Ancor Co., has a lease on the entire Gold hill property of that company, and has commenced work on the fourth and fifth levels.

The pay roll of the mines in the Cripple Creek district for the month of July approximately reached \$700,000.

Chas. Walden, manager the Last Dollar mine, on the saddle between Bull and Battle, says that he has reached a depth of 1250 feet and the ore is continuous, and with depth has grown richer.

R. Johnson, the head machinery man of the Colorado Trading & Transfer Co., says: "Never before in the history of the camp has so much machinery been moved as there has been so far this month. In the district there are seven heavy machinery wagons and every one of them has been on the go as hard as possible since the first of the month. Considerable of the machinery is being put up by lessees, and the lessee is the backbone of the camp. They will take chances that the company refuses. The work that is being planned is immense and before long the number of plants in operation will be greatly increased. The machinery men are being worked night and day and the results will soon be apparent by the new strikes and the ore production."

At Cripple Creek the Ida May claim on Raven hill is producing 400 tons of ore a month, average value three ounces. The Strong mine on Battle mountain is making daily shipments of ore amounting to sixty tons, averaging \$30.

An examination is reported being made of the property of the Golden Cycle Co. by the U. S. R. & R. Co. with a view to purchase. This property is now producing 100 tons per day. The ore is susceptible to chlorination.

Relative to the resurvey of Cripple Creek, R. A. F. Penrose says that the Government will undertake it next summer, and will in all probability be carried out under the direction of Mr. Penrose, who made the original survey in 1894.

On the Jewel claim, in Poverty gulch, belonging to W. S. Stratton, a lessee has opened a body of ore that is yielding assays of twenty ounces to the ton.

In the case of the Portland G. M. Co. against the Monument M. Co., where suit was filed in the federal court for \$250,000 damages and an order asked for restraining the defendants from further work, an agreement permits the defendant company to continue work on the disputed claim, but stipulates that 35% of the profits are to be deposited in court pending the final settlement of the suit.

Cripple Creek reports a strike in the Shurtleff property, on Bull hill, adjoining Stratton's Eagles, in the 700-foot level, of a body of smelting grade ore.

A strike has been made on the Blue Bird, Bull hill, in the 1365-foot level, of a 6-inch body of gray copper. Assays return values of 4000 ounces in silver, 100 ounces in gold and 15% copper to the ton.

A. E. Allenbaugh of Cripple Creek has sold to Brooklyn men his one-third interest in the Americus, Chinn and Fairview claims, at Garfield, for \$250,000—\$50,000 cash, \$100,000 in twelve months and \$100,000 in two years.

IDAHO.

BLAINE COUNTY.

A. Wilson of Martin will develop the property of the Mayflower M. Co., 60 miles from Blackfoot and 40 miles from Mackay, the terminus of a branch of the Oregon Short Line Railroad. The treasurer is H. E. Neal of Boise. The company is putting up a 5-stamp mill. It is the intention to have the larger part of its ore treated at the Mackay smelter.

J. Black, manager Hattie Co., Hailey

gold belt, is pushing development work. The Tip Top, owned by J. Q. Packard, has gold and silver bearing ore at a depth of 1000 feet. In the Minnie Moore the shoot has been recovered. The property is now in the hands of Chicago men, by whom it was unwatered. At the Black Cinder the pumps have been withdrawn to join the Camas No. 2 in the sinking of a new joint shaft. The Croesus is to resume. The Idaho Democrat, under the management of S. Allen, continues production. The Five Points group, in Smoky district, has just been sold to Mr. Rogers of New York for \$30,000, and next spring will have a mill.

BOISE COUNTY.

The Lincoln M. Co., Pearl district, will put in a mill of 100 tons daily capacity.

IDAHO COUNTY.

The Jumbo M. & Co. has incorporated at Grangeville; G. Flier, G. W. Fisher of Concord, G. W. Overfield of Grangeville, L. and C. Olson of Dixie, F. Brown of Mount Idaho.

G. M. Waterhouse says at Warren 400 men are employed at the Silver King mine; part in the mine, a number in erecting the mill building and removing the 10-stamp mill from the Iola property to the Silver King.

On Smith profile and Big creeks in the Thunder Mountain district work is being done.

At C. L. Hathaway's placer camp on Grouse creek, between Resort and Warren, are sixty men working.

At Resort, the Golden Rule P. M. Co., C. L. Hathaway, manager, has 2000 acres of mining ground. This season they have been running a duck hose for a pipe at present, with a 2½ inch nozzle on a 6-inch hose. They have four carloads of hydraulic pipe and four giants at Council, the terminal of the railroad, which they will have hauled in by teams, 75 miles, in time for next season's work.

At Dixie, W. H. Plummer has bonded the Dixie group of claims, the Dixie Queen, Evergreen, Pilgrim, Scrap Iron, Marguerite, and a millsite, to Chicago men for \$100,000. The bonders are to put \$1000 per month into the property until 1000 feet of underground work is completed, within a year. There is already machinery and improvements on the claim to the value of about \$40,000, and additional equipment is to be added as needed.

NEZ PERCE COUNTY.

At Lewiston, the Pacific Coast Pipe Co. of Spokane, Wash., has a contract at 49¢ cents a foot for 8000 feet of 8-inch wooden pipe, and at 39¢ cents a foot for 3000 feet of 6-inch wooden pipe. Crane & Co. of Portland have a contract at 44¢ cents a foot for 6-inch c. i. pipe and at 26.97¢ cents a foot for 4-inch pipe.

OWYHEE COUNTY.

The Silver City Avalanche reports a strike of gold ore on the Holland property on Florida mountain.

SHOSHONE COUNTY.

The Gem concentrator, owned by the Hecla M. Co., is now taking 200 tons of ore per day from the Hecla mine. The power for the mill is furnished by water, but steam will be used, which will necessitate more men.

A county road from Burke to the Hercules mine is building. It will be run by the Stanley, Trade Dollar and other prospects. The road has been needed for some time.

The Wallace Tribune gives credence to a local rumor of a contemplated sale to the American S. & R. Co. of the Tiger-Poorman, Standard, Mammoth, Hecla, Helena-Frisco, Morning and Hunter mines. That would leave the Hercules as the only independent producer in Canyon Creek and Mullan districts.

Near Burke the Hercules mine put in a sawmill and a six-drill compressor. Thirty men are employed. The company plans to construct an aerial tramway from the mouth of the mine to the railway tracks at Burke, 1 mile.

On the monthly pay day on the 15th at the Bunker Hill & Sullivan mine the amount paid out was \$55,000, distributed among 550 men, including office help. The most of the men work in the mine at Gardner.

At Gem the Frisco mine will resume operations. The pumps are working day and night to keep the mine free from water, so that work can be started at short notice.

At the Snowstorm mine, 3½ miles east of Mullan, in tunnel No. 2, which taps the vein in about 700 feet and a depth from apex of 600 feet, a body of ore 42 feet wide is cut, which was drifted on 125 feet west and crosscut both ways, showing the ore body to be the same width as where crosscut by tunnel. A drift to the east was run for 110 feet, the face of which is of azurite and silicate of copper. The new tunnel, No. 3, is now in 150 feet, and when

finished will tap the vein at a perpendicular depth of 1072 feet.

MICHIGAN.

HOUGHTON COUNTY.

At Houghton the Baltic mill has started its full complement of three heads of stamps on double shift, stamping 1500 tons of rock daily and making possible a product of 600 tons of copper monthly.

The electric haulage plant in the Butler tunnel of the Adventure is in operation, the second plant of its kind in the copper country. The tunnel crosscuts five lodes and is nearly half a mile long.

MINNESOTA.

More than 12,000,000 tons of iron ore have been shipped from the upper lakes to Eastern and Chicago furnaces so far this year. Of this 7,250,000 have come from Minnesota mines, a greater proportion than in any past year. It is evident that there may be moved during the full season of navigation more than 24,000,000 tons if there is need of so much, and it now looks as though there would be. This will be 12% more than the year before, which was by far the biggest year on record. Last month the Sault canal alone passed ore to the amount of 3,500,000 gross tons.

MISSOURI.

JASPER COUNTY.

Joplin reports no change in the assay basis price of zinc ore, which is still \$35 per ton for ore assaying 60% zinc or better, but under grade ore sold at a rate of \$34 for 60% zinc. The highest price reported paid was \$38 for several bins of 63% zinc. Lead ore sold all week at \$49 per ton delivered.

The output by camps is as follows:

	Zinc.	Lead.	Value.
Joplin	3,386,500	450,880	\$70,311
Galena-Empire	1,371,070	138,410	23,957
Carterville-Webb City	1,737,520	314,570	35,517
Spurgeon	190,100	73,410	4,614
Aurora	718,350	22,010	11,820
Oronogo	394,930	5,260	6,749
Duenweg	1,194,710	150,310	22,396
Prosperity	528,180	22,050	9,783
Neck-Alba	411,550	7,202
Wentworth	87,720	1,053
Central City	240,420	5,200	3,493
Cave Springs	211,080	3,377
Carthage	329,780	5,606
Zincite	208,720	3,653
Carl Junction	100,930	1,817
Granby	402,000	59,000	5,825
Fortuna	86,080	2,112
Sherwood	40,260	604
Total value	\$188,403	\$31,486	\$219,889

MONTANA.

The receipts of gold and silver at the Helena Assay Office in July show an increase of \$18,784.92, as compared with the same month of last year. There was a notable decrease in the receipts from other States than Montana, but there was an increase of \$44,349.10 from Montana, which more than offset it. The receipts were as follows:

	1902.	1901.
Montana	\$172,501.95	\$128,252.85
Idaho	14,145.99	15,673.94
British Columbia	17,398.99	52,303.72
Other States	13,713.53	2,145.03

Totals

There was a marked increase in all the gold-producing counties of Montana. Lewis and Clarke, of which Helena is the county seat, shows an increase from \$22,015.06 to \$35,156.35; Fergus from \$32,458.95 to \$45,540.67; Madison from \$24,063.76 to \$36,483.36; Park from \$11,721.85 to \$17,836.11. Last year the undivided county of Deer Lodge together shipped \$15,414.92, while this year Powell and Deer Lodge together shipped \$16,232.26, of which Powell contributed \$12,467.87 and Deer Lodge \$3764.29.

BEAVERHEAD COUNTY.

W. Driscoll of Twin Bridges is developing the Golden Era, Mascot and Baltimore claims, 12 miles northwest of Bannack. He has a tunnel 150 feet and has 5½ feet of ore, carrying gold and copper.

At Bannack the Excelsior mine continues to yield ore.—At the Polaris mine connection has been made between the tunnel and the old workings.

The A. F. Graceter, F. L. Graves and Montana gold dredgers continue working on Grasshopper creek.

Graphite exists in commercial quantities in Axe canyon, south of Dillon, said to be the only place in the United States where crystal graphite is found. The product of these mines is said to equal the best grades brought from Ceylon, and it has been favorably passed upon by the Dixon Crucible Works, to which company several shipments have been made.

At Hecla, formerly known as Lion City, near Glendale, H. Knippenberg has a

large body of silver lead ore. Some of it runs 100 ounces in silver and 40% lead.

Bonanza is a new mining camp 10 miles from Wisdom, near the Big Hole river. A group of claims there has been bonded to W. E. Sanders of Helena for \$60,000. At the Franklin Stant property, Stant is crushing some of his ore in an arrastra. It averages about \$45 per ton gold.

CHOTEAU COUNTY.

J. J. Hill of the Great Northern Railway Co. will erect a steel and iron plant at Great Falls. He has bought a half interest in the Conrad iron mines for \$25,000 and the recently discovered deposits of manganese in Jefferson county for \$17,000.

FERGUS COUNTY.

The Great Northern M. & D. Co., at Gift Edge, has sold its property to J. A. Drake of Chicago, Ill., for \$500,000. Two payments have been made upon the purchase price, final payment to be made in October. The purchaser will enlarge the mill and operate the property upon a larger scale than at present.

GALLATIN COUNTY.

E. F. Slack, of the Montana Corundum Co., says the mill will be in operation next month. The company has twenty-two men employed, some of whom are building a dam at the head of Elk creek. The mill will have a capacity of fifteen tons per day, turning out about four tons of crude mineral. Crushers are to be used in reducing the corundum to powder fine enough to pass through screens from 45 to 100-mesh.

GRANITE COUNTY.

The Michigan & Montana M. Co. will work its property on Stony creek, 16 miles west of Philipsburg, under the direction of J. H. Ortman of Philipsburg.

F. Pilling has a retort of gold from the property of the Sunday M. Co., adjoining the Royal Gold, valued at \$2500—the result of a two weeks' run and the seventh turned out of the mill within three months.

The Good Hope M. Co. contemplates the erection of a steam hoist on the Silver Chief claim at Tower.

JEFFERSON COUNTY.

Work at the property of the Eva May M. Co., near Basin, will soon be resumed.

LEWIS AND CLARKE COUNTY.

The Boston & Seattle M. Co. of Toledo, Ohio, who recently purchased the Ontario, Richmond and other properties in the Little Blackfoot district, has C. R. Tuttle as general manager, who will make his headquarters at Helena.

Near Helena, D Davenport, who holds the Kenwood copper mine under bond, will begin work on the property. Under the terms of the agreement with the owners he must begin work before Oct. 1 to escape forfeiting the bond. The property is bonded for two years from June 30.

MADISON COUNTY.

Howell & Morris are operating the Regenta, near Twin Bridges.

NEVADA.

CHURCHILL COUNTY.

J. E. Spencer, superintendent of the Keora M. Co., will sink the shaft 100 feet deeper. If the ledge holds its present width and value a plant for the reduction of the ores will be erected.

ESMERALDA COUNTY.

Near Hawthorne the surveyors have completed the work of surveying the pipe line from Cottonwood canyon to the Pamlico mine. They have also made surveys for a millsite near Pamlico and a tramway from the Lapanta mine to the millsite. Tunneling for an increased water supply is in progress at Cottonwood.

EUREKA COUNTY.

Ore shipments by rail from the mines of Eureka for the week ending August 15 were as follows: Bullwhacker 46,260 pounds, Cyanide 26,500, Diamond 40,940, Eureka Con. 61,420, Excelsior 48,890, Helen 2780, Madrid 11,530, Macon City 2250, From Hamilton: Rocco-Homestake 61,550, L. Lani & Co. 34,430.

HUMBOLDT COUNTY.

The new hoist at the Adelaide mine, 14 miles south of Golconda, is completed and work will be resumed in the incline shaft. Bodies of copper ore are being developed.

Manager C. S. Vagner of the Gold Note, Kennedy, has ore which shows on controls \$86 gold and eight ounces silver per ton.

LANDER COUNTY.

P. T. Farnsworth, of Salt Lake City, Utah, is said to have decided to put in a mill on the New Pass mine at South Pass.

LINCOLN COUNTY.

A cyanide plant at Searchlight is treating the old tailings.

The mill at Sandy is running full time on ore freighted from the Keystone mine,

7 miles east of Sandy. There are twenty men employed at the mine.

The Nevada Keystone M. Co. has incorporated at Pioche.

Mrs. Rose Howard, who owns claims in Chiquita hills and works them herself, has made application for membership in the Searchlight Miners' Union. This being the first case of the kind on record, the union has referred the matter to the headquarters of the Western Federation of Miners for instructions.

LYON COUNTY.

The Pollard mill in Silver City is crushing ore from the Silver Hill mine.

Silver City reports a mining deal under way whereby the Quinn mine may be sold for \$40,000.

The Como-Eureka Co. at Como will build a new mill. Power will be supplied by an electric plant which the company will install, obtaining water supply from the Carson river.

Development work on an extensive scale will be begun on the Bluestone mine, near Yerington, Sept. 1.

NYE COUNTY.

Superintendent F. J. Siebert of the Tonopah M. Co., the Tonopah T. & M. Co. and the Klondike M. Co. says the Tonopah M. Co. is employing 190 men, 30 are on the Tunnel Co.'s payroll and 30 men are working in the Klondike mine. Nothing but strict development work is being done. The only ores extracted are in the course of this work, yet 600 horses are used transporting ore to the railroad. Nearly all this is new ore extracted from the various workings. A great deal of the ore taken out by the leasers is still on the dump. The ledges in Tonopah continue to widen with depth and preserve their surface values. The proportion of values is 1 ounce of gold to 100 ounces of silver. In a winze 50 feet below the 300-foot level is a ledge 8 feet in width that averages \$350 per ton.

The Tonopah Union M. Co. is organized; J. L. Butler, F. K. Thorn, H. C. Stock, T. Colehan, A. Revert. The property of the company consists of five claims on the west slope of Gold mountain, 5 miles south of Tonopah. Assays show values two-thirds in gold to one-third silver. Two shafts will be started.

Blythe & Hanson, from Long Beach and Los Angeles, Cal., have bought one-half interest in the Gold Hill Extension group, comprising seven claims and a tunnel site. The first payment of \$15,000 is made and deeds placed in escrow pending final payments Oct. 1. The present double-compartment shaft will be extended 300 feet and a 26 H. P. gas engine, hoist, gallows-frame and equipment installed.

Tonopah county is next in order. Development work at Tonopah dates from March 1, 1901, and since that time the camp is said to have produced upwards of \$7,000,000 without the aid of outside capital.

STOREY COUNTY.

Superintendent Kyle of the Silver Hill is shipping \$8000 in bullion monthly. The ore averages \$15 50 to the ton.

An addition of five stamps to Fisher's mill, Six Mile canyon, near Virginia, is planned.

WASHOE COUNTY.

The Hutchinson mine, Olinghouse canyon, has ore which is locally believed to be worth \$20 a pound.

The Con. Nevada M. Co., Wedekind district, is drifting for the ledge from the 155-foot level. The Consolidated Nevada Co. has bought forty acres of patented ground adjoining its claims, making its present holdings eighty acres.

At Steamboat Springs Manager Hopkins will put in an 80 H. P. boiler at the Great Western hoist. Miners go to work next week. A station will be cut at the 100 level.

WHITE PINE COUNTY.

A strike of \$100 ore is reported in the Joana mine, near Ely.

The most recent strike at Ely is in the Ruth, averaging 23 1/2 copper. The Ruth shaft is down 275 feet.

NEW MEXICO.

OTERO COUNTY.

Amended articles of incorporation of the Electric M. & M. Co. of Jarilla have been filed; capital stock increased from \$100,000 to \$200,000.

SANTA FE COUNTY.

Manager R. B. Thomas of the Con. M. & S. Co., Cerrillos, says he has finished expending \$125,000 in making improvements and building additions to its plant at Cerrillos. G. P. Hyde, former assistant superintendent of the El Paso smelter, has been appointed superintendent of the Cerrillos plant.

OREGON.

BAKER COUNTY.

M. N. Thompson, manager Granite Mt. M. Co., near Huntington, has let a con-

tract to extend the tunnel on Granite mountain 300 feet.

The Oregon Gold & Copper Co. is incorporated at Baker City; capital stock, \$1,000,000; A. V. Reeves, J. W. Nelson, A. Mohr.

Manager W. L. Vinson of the Little Emma mine has an assay certificate giving returns of \$125 to the ton on Little Emma ore; ore from the lower tunnel cutting a 2-foot ledge that carries a pay-streak 8 inches wide.

Manager Barbee, Crown Point mine, Cable Cove, is installing a new air compressor.

The Oregon Smelting & Refining Co. will have in its new smelter at Sumpter a 200-ton hot blast copper furnace, with all necessary power plant and equipment. The cost of the machinery will be about \$35,000. F. W. Mueller is in charge.

At the new town of Greenhorn the Phoenix mine is being successfully operated.—At the Snow Creek mine J. J. Faucett is putting in a 20-stamp mill, the plant that was formerly at the Little Giant.—The Black Hawk is being operated and a 5-stamp mill running.—The Evening Star, owned by McDaniel & Lew, has a 3-stamp mill producing \$100 in gold daily.

The Baisley-Elkhorn mine, 14 miles from Baker City, after lying idle a year will resume.

In February, 1901, C. A. Smith agreed with J. T. and J. G. English, owners of the Golconda mine, for the purchase of 980,000 shares of stock in the mine for \$400,000. Smith was to expend \$3500 per month on the property for twelve months, make payments on the purchase price of the stock from time to time, and in the end was to become the owner of the 980,000 shares. The right to acquire the stock was at Smith's option. Smith took possession and operated the mine until October, 1901, expending, as he claims, his own money as well as the money taken from the mine—\$20,000—quit work and opened negotiations with the Englishes to take back the mine, and abandoned, it is alleged, his rights under the contract. There is a controversy between the parties as to the terms of this latter agreement. The Englishes resumed control of the property in November, 1901. In July the Englishes brought suit against Smith in Ohio, under the laws of that State, for damages for failure to carry out the terms of the contract made in February, 1901, alleging that the mine was improperly worked; that he had refused to turn over the mine stock. They also alleged separate damages, the aggregate being \$343,000. The Golconda mine was sold by the Englishes, after they resumed control of it again last November, to Sumpter and Pendleton people for \$250,000 cash. It is now being worked.

GRANT COUNTY.

The Fourth of July group of quartz claims, north of Granite, is bonded for \$8000 by S. Camp, who has also bought the Gold Ridge patented claim adjoining for \$3000 cash.

JOSEPHINE COUNTY.

S. Penrose, secretary Waldo S. & M. Co., is visiting the mines of the company at Waldo, where men are developing the properties and erecting buildings. The company projects the erection of a new smelter at Waldo.

LANE COUNTY.

Cottage Grove reports the Music mill, which has been idle two years, has started up; ten stamps will be kept steadily working. There is demand for miners and teams to haul freight.

SOUTH DAKOTA.

CUSTER COUNTY.

At Custer H. Francis is sinking a shaft for the Black Hills & Duluth Copper Co.—The Leroy M. Co. has resumed operations on French creek, 3 miles west of Custer.—F. Herbert of Oreville has been experimenting in the recovery of cassiterite by crushing in his 2 stamp mill, the gangue passing over the amalgamating plates, but covered by the blankets.

LAWRENCE COUNTY.

At Lead, Superintendent Steele of the Hidden Fortune Co. is driving across the Bingham lode, now 160 feet in ore.

Mullen & Munn are placing the rock foundation of the Hidden Fortune mill on the rocky hillside below Deadwood. The railway spur is completed to the site.

The Clover Leaf Co. is laying the sill floor of a stope 50 feet wide in the ore on the 500-foot level, recently opened, and is making a raise to connect with the 400 level for ventilation. When these are finished the whole sixty stamps of the new mill will be put in motion.

S. Thompson, superintendent the Connors Bros. of Spearfish, is sinking a shaft on the Boston group, Bear Gulch district.

Near Lead, the Hidden Fortune has driven 160 feet across the ore body in the Bingham lode, recently uncovered, with-

out finding the west wall. The ore shows milling values in free gold. The Hidden Fortune mill, near Deadwood, is under construction.—The Columbus Co. is re-timbering and enlarging the Columbus shaft to three compartments.—The Sam mine is developing into a valuable property.—The Ohio & Deadwood Co. has installed a 100 H. P. boiler and a six-drill compressor on its mines near Rochford.

Negotiations between the National Smelting Co. and the Horseshoe M. Co. of Deadwood and Chicago are reported. The National S. Co. has completed a 500-ton smelter at Rapid City, intending to get ore from the mines of the Hills, but has failed to get enough ore. The Horseshoe Co. has recently been reorganized by Chicago and Montreal people, and is operating a 100-ton cyanide plant near Deadwood, and is planning the erection of a 1000-ton cyanide plant. Should the deal go through it might mean the closing down of the Golden Reward smelter in Deadwood.

PENNINGTON COUNTY.

At Keystone, the Tycoon Co. has let a contract to run a 500-foot tunnel on the Ranger group, south of Battle creek, along the strike of the Holy Terror ledge.

TEXAS.

JEFFERSON COUNTY.

A report issued by a company operating at Beaumont says: "There has been nearly \$50,000,000 invested in the different branches of this industry at Spindle Top and Port Arthur in the past year; consisting of the drilling of gushers, drilling rigs and other machinery, about 200 oil tanks, average capacity 37,000 barrels each, scattered from Spindle Top to Port Arthur; five pipe lines from Spindle Top to Port Arthur and Sabine Pass; average length 20 miles each, average cost \$10,000 per mile; one asphalt plant building between Beaumont and Port Arthur; one oil refinery now in operation at Taylor's bayou, about 2 miles west of Port Arthur, cost about \$1,000,000. Another oil refinery much larger, now building close by, also at Taylor's bayou; and yet a larger refinery building on west bank of Neches river, only about 2 miles from Beaumont and Spindle Top. This latter is supposed to be a branch of the Standard Oil Co., and is to cost upwards of \$2,000,000. It is estimated there are fully 2000 tank cars now in use hauling this oil to market, average \$800 to \$1000 each; about 200 tank steamers and barges, besides the vast amount invested in Texas oil lands that can't be well calculated; also storage tanks in many cities and numerous other outlays."

UTAH.

BEAVER COUNTY.

Near Milford the Cactus shaft is 630 feet deep. The ore carries 4% copper and good values in gold and silver; experiments show that it can be reduced to a 17% product, in which form it will be sent to the smelter. It is expected to handle 1000 tons per day, which would mean a daily output of 80,000 pounds of copper.

IRON COUNTY.

Development of the Iron Mountain Copper Co.'s group of mines in this county will be resumed at once, is told the Tribune by Manager Frew. The shaft is to be sunk 200 feet deeper.

JUAB COUNTY.

The Centennial-Eureka M. Co. at Eureka has resumed.

The shaft on the property of the Raymond M. Co., north of Eureka, is at a depth of 1050 feet. Sinking may be continued to 2000 feet.

SALT LAKE COUNTY.

Bingham hears of a plan to consolidate the United States, Utah Consolidated, Bingham Consolidated and Boston Consolidated companies' mines and smelters into one corporation, with one management, and a consequent reduction in operating and general expenses. The story is generally discredited. The Utah Consolidated is reported to be now producing 1,000,000 pounds of copper per month, the Bingham Consolidated 800,000 pounds, and it is expected that by January 1 the United States Co. will be adding 750,000 pounds more to the output. The Boston Consolidated is capable of supplying ore enough to add to this estimate 600,000 pounds.

The Tribune says: The reopening and equipment of the Franklin tunnel at Bingham, through which the Silver Shield Co. will, in future, dispatch its ores to market, has been completed, active blasting through the interval that separates the breast from Shield territory to follow at once. From the mouth, which overlooks Bingham canyon, to the breast of the avenue the distance is no less than 3600 feet. Through this entire distance the necessary re-timbering has been done, electric wires have been strung, and with the transformers in place and the electric

motor on the track driving will be resumed.

SEVIER COUNTY.

C. J. Peterson, manager Trapper's Pride mine, Richfield, says that the company has not yet decided whether to use stamps or rollers for crushing the ore. If the stamps are used, the mill is to be of forty tons capacity; if a roller process be decided on, the plant can handle seventy-five tons per day.

SUMMIT COUNTY.

Superintendent Turner of the J. I. C. group, Park City, on which the Federal Lead Co. of St. Louis have a \$200,000 option, is sinking a new shaft 1500 feet south of that of the Daly West.

Manager Dodge of the Bonanza Con., at Park City, has at 300 feet the contact; in the quartzite are splashes of galena carrying silver and gold. It is the intention to continue the tunnel until the farther wall is reached, after which prospecting the contact in each direction will follow.

At Park City the Silver Bell mine is now producing ore for the valley smelters. The new mill of the D. & M. M. Co. at Park City starts this week.

The Wabash M. Co. has approved the purchase of the Storey group at Park City by N. Treweek for \$60,000. At the same session the board adopted a resolution making it discretionary with the management as to who shall be admitted to the mine.

WASHINGTON COUNTY.

At Silver Reef, Manager T. Ferguson of the Silver Reef M. & R. Co., expects to have the new cyanide plant at work by the close of the year on the 400,000 tons tailings.

VIRGINIA.

AUGUSTA COUNTY.

At the Crimora manganese mine, instead of with shafts and drifts, the ore is now being washed out by hydraulic methods. The deposit occurs in a deep basin in quartzite, has a depth of 250 feet at its deepest point and is said to be 1/2 mile long by 1/4 mile wide. The basin is filled with stiff clay, overlaid by gravel; the ore is found in the clay in irregular detached masses of varying size. The ore averages 50% manganese. The mine was worked for several years by the Carnegie Steel Co. The method employed was by shafts and drifts, the deepest workings being 150 feet. This plan required a great deal of timbering, 150,000 feet per month being used, and a large amount of ore was left behind. In the method now in use the covering of wash and gravel is first removed by loading into cars and hauling away. The clay bank is then washed down by water under a head of 275 feet, using a 2-inch nozzle, and the waste runs off through a short tunnel at the lowest point of the pit. The ore, washed comparatively clean in this way, is wheeled to the mill on the edge of the pit, there dumped into a chute, loaded into skips and carried to the crusher at the top of the building; from the crusher it goes to the washer, and then to the screens, all under 1/2 inch, passing to the jigs, and over that size to a belt-picking table, where the large pieces of waste are removed. Some of the pieces of ore still hold considerable clay in the cracks and joints; these are picked out and passed back to a small crusher, the product from which goes to the jigs. Manager Hannan intends running another tunnel that will tap the deposit at its lowest point, thus enabling him to work out the entire basin. The length of this tunnel will be 4500 feet, the greater part being through clay. The production at present is fifty tons per day.

WASHINGTON.

FERRY COUNTY.

Republic mine owners are told that no ore can be taken at the Grand Forks smelter for thirty days. There being no likelihood of the railroad being able to reach the Lone Pine in that time, that property was closed and the men paid off; operations will be suspended for thirty days at least. The Black Tail and San Poil continued operations until word was received that the ore could not be handled owing to the smelter closing down. The stopes in the Black Tail are full of ore, and the same may be said of the San Poil. The mines will remain closed until the Granby smelter resumes operations. Manager Johnson of the Greenwood smelter expects to resume operations just as soon as he can get the coke. It is uncertain when the Boundary Falls plant will start up. These smelters will take some Republic ore, but not to exceed 100 tons per day.

L. H. Hopkins, superintendent Congress mine, Bridge creek, says that men are working on the Congress, Robbin and Art Dumont claims.

Republic has from the Great Northern Railway a rate of \$5 per ton for shipment

and treatment of Republic ores to Everett.

OKANOGAN COUNTY.

W. T. Mendonhall has bonded the Bl-Metallo mine, near Chesaw.

SNOHOMISH COUNTY.

Near Silverton the Copper-Independent mine is being operated. The compressor plant has started up and men are driving the main tunnel, No. 3. This tunnel is in 1100 feet.

STEVENS COUNTY.

J. D. Farrell of the Pacific Coast Co., who recently bought iron claims near Valley for \$25,000, is developing the property. It is expected he will keep thirty-five men at work.

WHATCOM COUNTY.

At Sumas the Excelsior M. Co. started up the stamp mill on the 20th.

The Vera group of claims will be operated and a stamp mill put in.

WISCONSIN.

DOUGLAS COUNTY.

A copper mining property is being opened south of Superior by Captain Dunn of Houghton, Mich. The two shafts which are sinking show native copper.

WYOMING.

JOHNSON COUNTY.

Buffalo asserts that the Lost Cabin gold mine has been found again on Otter creek, in the Big Horn mountains, 60 miles southwest of that place. There is a rush there.

FOREIGN.

AUSTRALIA.

The gold mines of Australia produced in 1901 a total of 1,879,391 ounces. The East Coolgardie gold fields raised the output from that field alone to over 1,000,000 ounces. The value of the Australian output for last year was \$35,213,511, as against \$29,237,014 in 1900. It produced copper ore estimated at \$75,246. The production of lead has practically ceased. The output of block tin was 734 tons, valued at \$40,000.

BORNEO.

J. D. Gillinan says there is great opportunity for American capital and skilled labor in Borneo and Sumatra, especially in territory controlled by the Holland Dutch. Ever since the outbreak of the Boer war the Dutch have favored Americans at the expense of the English. Gold, diamonds, oil, coal and platinum exist, but have not been developed to any extent, because modern machinery is lacking, and the coolies, who do the bulk of the manual labor, can not stand the climate. The Dutch are poor hands at mining, but are generally waking up to the fact that the purchase of American machinery will prove a profitable investment. In south Borneo, controlled by the Dutch, several American mining engineers are prospecting and have found extensive low-grade propositions in placer and quartz. Some of these are exceptionally rich. The Chinese worked a few of these properties until about eighty years ago, when they were driven out by the Dutch.

BRITISH COLUMBIA.

Mining Recorder McInnes of the Slovan has notice that on a date to be set by the department a tax sale of all Crown-granted mineral claims on which the taxes are unpaid, and the rights of all pre-emptors on lands on which the taxes have not been paid, will be sold at auction. Gold commissioners and mining recorders throughout the Province are instructed that, provided they are satisfied that the construction of a trail is essential to the proper development of a claim, a free miner may be allowed to count the cost of the same towards his annual assessment work, on obtaining permission before hand from the proper official and subject to the inspection of the Government.

Repairing the plant of the Bullion Extraction Co., at Silica, 2 miles west of Rossland, is in preparation for the concentration experiments of the War Eagle and Center Star companies. Several carloads of ore will be shipped each week to the plant, and the experiments, under the direction of G. V. Hopkins, will be continued. The system to be tested is understood not to be the Elmore process, but is said to have given excellent results in the laboratory.

The Nickel Plate mine is employing forty-five men. The owners have bonded the Winnipeg mineral claim for \$30,000. Manager Rodgers will build a plant and stamp mill to treat his high-grade ores on the east addition to Stilkameen City.

In the Contact mines, Burnt Basin section, on the Columbia & Western Railroad, 20 miles from Rossland, H. P. Jackson, managing director of the company, sent to Baker & Co., Newark, N. J., some ore and is told by them that the ore car-

ried platinum at the rate of one-quarter ounce troy per ton. The ore carries \$10 to \$12 in gold and silver.

The first clean-up this season at the Con. Carbon hydraulic mine, at Bullion, has been sent to the assay office at Vancouver. It is about \$50,000—the product of twenty-four days' piling pay gravel.

The shipments from Rossland for the week ending the 16th were: Le Rol, \$200; Le Rol No. 2, 1400; Giant, 120; White Bear, 20; total for week, 5740; for year to date, 196,628 tons.

At the Sullivan group at Marysville, the smelter project is not to be abandoned. The company is going ahead with the work and expects to put on a full force September 1, and to be smelting ore within sixty days thereafter. Manager Elmdorf is in charge.

"The lead situation in British Columbia offers so poor an outlook that we have decided to close the St. Eugene indefinitely," says J. Cronin to the Spokane Spokesman-Review. Mr. Cronin is the manager of the mine at Moyie.

"For months, since shipments were stopped, we have been keeping a force of about thirty men on development, steadily opening the ore body, so as to have it in shape when the price of lead should advance enough to give us a market. There is so little cheer in the outlook, however, that the crew on development will be laid off, probably within the next month, and the mine will be standing idle until conditions change. We have decided that it is useless to keep on putting money into development when it is so uncertain as to the length of time until we shall be able to ship.

"Lead in London now is worth about £11 2s 6d, and on that basis the producer in British Columbia is paid only about \$1.30 a hundred for his product, as against \$3.50, which is the contract price agreed upon by the Cœur d'Alene mine owners with the American Smelting & Refining Co. That difference in price puts a fatal crimp on us. There is a duty of 1½ cent a pound on lead ores, and if we could market our output in the United States and pay the duty we would still get \$2 a hundred for our lead, or more than 50% above the market price now in British Columbia. However, we are barred from entering the American market, even by paying duty, because the American Smelting & Refining Co. will not buy our lead at any price until its surplus is worked off, and the smelters outside of the trust are so busy that they can not take our ores."

CANADA.

During the fiscal year ended June 30, 1902, Canada exported to the United States 30,419,000 pounds of copper matte, valued at \$2,990,000, of which over \$2,000,000 worth was exported from the Boundary country.

MEXICO.

Some months ago the San Fernando C. M. & R. Co. decided to develop some mining properties in Mexico. To avoid the heavy taxation imposed by the Mexican Government on foreign corporations doing business in Mexico, the directors decided to list all their Mexican holdings in the name of E. C. Humphrey, the Mexican agent of the company. Recently a stockholder of the company sent to the secretary of the board a clipping from a Mexican paper, telling of the sale of all the mining property owned by E. C. Humphrey to some New York mining brokers. Investigation was made with the result that suit was filed in the U. S. Circuit Court at Los Angeles, Cal., to recover the property. Judge Wellborn decided that the company could not recover, because the allegations of the complaint were based on an acknowledged attempt to evade the law, and therefore had no standing in the court.

CHIHUAHUA.

Manager S. Lawrence, at Barranca del Cohre, where the Lewis Co. is operating, says they are now hauling concentrates a distance of 120 miles to the railroad, but when the new road is in operation as far as Rochivos, near Becoya, it will be necessary to haul concentrates and provisions only 35 miles. Mr. Lawrence will use between 1200 and 1500 mules this fall. There are 250 men employed at the mines.

A. B. Callender, agent Compania Metallurgica de Torreón, has bought a half interest in the Maria claim, Parral, owned by A. L. Rossen.

A 100-ton amalgamating plant will be built at the Adela mine, near Santa Barbara, the property of W. V. Petit. The mine is shipping ores, which carry gold and silver.

OAXACA.

Rich placer grounds 40 miles northeast of Tutepec are reported. There are 100 miners washing for gold along the tributary of the Rio Verde, making from \$3 to \$15 a day. The pay dirt lies about 5 feet below the surface. Sluices are being built

and several washers have been shipped into the country. Several companies composed of Chicago, Ill., men have been organized to work these placers. The grounds are in an accessible part of the country, and no difficulty is experienced in shipping in supplies. The miners already at work include Mexicans, Chinese, Indians and Americans.

SONORA.

The Greene Consolidated at Cananea has three converters at work. The company is shipping at the rate of 3,000,000 pounds of blister copper per month, equivalent to about 6,000,000 pounds of matte, as the Cananea matte does not go more than 50% copper.

W. E. Pomeroy is superintendent Yaqui Copper Co., operating on the Yaqui river, near Sualqui de Bactuco. W. P. Harlow of Tucson is manager. Superintendent Pomeroy states that when he went to take charge forty-five men were employed. The number has since been increased to 140. The only means of getting machinery to the mine is on the backs of burros, and it is necessary to have it built in parts; the copper holdings are located on the line of the proposed railroad from Cananea to Topolobampo.

SPAIN.

In a letter to E. A. Haggren of Rossland, B. C., W. A. Carlyle, writing from Rio Tinto, says: "Our profits last year were \$7,500,000."

VENEZUELA.

P. Schuch, a Colorado miner, has returned from Venezuela, where he has been inspecting the machinery and property of an extensive mining company, and reports that the present civil war is the cause of a total wreck of the plant; that the iron and steel were taken by the insurgents and that a new plant must be installed.

THE KLONDIKE.

It is figured that the output this year will be less than that of last year. According to conservative estimates, it will be about \$14,000,000. Taking the output of last year at \$18,000,000, which was the correct figure, the output this year will be at least \$4,000,000 less. This is the result of a scarcity of water. There are two questions which are to be solved by the Government in connection with the Klondike, and the water problem is one of them. Water must be provided for the creeks so that the miners may treat dirt which now is not considered paying, because it is not so rich as that worked in the past. With good water supply much ground that would not pay to touch at present may be worked to advantage.

Official figures show that the gold shipments from Dawson during May, June and July amounted to less than \$6,000,000. This is less than the shipments during the corresponding periods of several previous years. The figures do not mean that the gold production has lessened to any great extent, but rather that the gold is staying in the country to a larger degree. Controller Lithgow of Yukon Territory has posted notices to the effect that the Dominion assay office at Vancouver will give full assay value for gold free of charge on the production of royalty expert certificates.

Personal.

ARTHUR KNAEBEL of Bland, N. M., is visiting Denver.

F. BETTLES has returned to Salt Lake from South Dakota.

S. W. MUDD has returned to Leadville, Colo., from California.

W. M. NESBIT is manager Helene Co.'s property, Eureka, Utah.

C. S. VADNER is manager Gold Note property, Kennedy, Nev.

W. G. MOORE has returned from Mercur, Utah, to Denver, Colo.

J. W. BUCHER is assayer and chemist N. Y. & N. C. Co., Ely, Nev.

H. ZERBE is general superintendent Cygnat Co., Stockton, Utah.

LEON M. HALL has returned from Grass Valley, Cal., to San Francisco.

CHARLES BUTTERS is expected at Virginia City, Nev., from Europe, Sept. 1.

H. V. CROLL of the Allis-Chalmers Co. has returned to Salt Lake City from Chicago.

WM. LAWLOR is general manager Hidden Treasure G. M. Co., Deadwood, South Dakota.

F. RICHARDSON is manager Santa Rosa mill of the Bufo M. & S. Co., Sonora, Mexico.

DANA KEITH of the Silver King, Utah, is examining mining property in eastern Oregon.

H. A. GALLWAY, superintendent of the

Parrott M. Co. of Butte, Mont., is in Reno, Nev.

N. W. EMMENS of Pittsburg, Pa., is inspecting mining property in Amador county, Cal.

J. M. BALDWIN has returned from Gold Fields, west coast Africa, to Hill City, South Dakota.

G. MCAULAY succeeds S. D. Nesmith as superintendent Big Channel M. Co., Forest Hill, Cal.

M. B. KERR has resigned the superintendency Grass Valley Exploration Co., Grass Valley, Cal.

JOS. DIEDRICHS AND C. A. KUEHN are at Omega, Cal., to plan a mill for the Red Cross M. Co.

D. WOODRUM has been appointed assistant assayer at the Mars, Bully Hill mines, Shasta county, Cal.

PETER DALY, superintendent Tacoma, Wash., smelter, has returned there from Salt Lake City, Utah.

FRANKLIN LEONARD, president and superintendent of the Comstock Tunnel Co., is in San Francisco.

W. A. HEWITT of the Compressed Air Machinery Co., San Francisco, has returned from Sonora, Mexico.

A. A. WHEELER of Nevada county, Cal., has gone to Nelson, B. C., to take a position with the Imperial G. M. Co.

R. M. LING has resigned as general manager McCabe Extension Co., McCabe, Ariz., and is succeeded by J. Bradford.

F. H. PROBERT has returned to Los Angeles, Cal., from an examination of mining property near Phoenix, Arizona.

LOCHIEL M. KING of the Pacific Coast Ore Sampling Works, who has been in Everett, Wash., on business the past month, has returned to Oakland, Cal.

EDWIN E CHASE, E. M., has gone to Mexico on professional business. His address until Sept. 1 will be care El Refugio M. & M. Co., Ocampo, Chihuahua, Mexico.

C. BEDELL, late superintendent Quincy mills, Houghton, Mich., and for thirty years an employe of that company, has been appointed superintendent of the Phoenix mill.

W. A. FARISH of Denver has accepted the management of the Majestic Co., Milford, Utah. He will reach Utah about Oct. 1 and will superintend the development and operation of the company's mines and smelter.

Catalogues Received.

THE Sullivan straight line air compressors and the Sullivan drill form the subjects finely treated in text and portrayal of the Sullivan Machinery Co.'s latest catalogue, issued from their headquarters, 135 Adams St., Chicago, Ill.; 54 pages of matter interesting to anyone at present related to, or likely to be related to, such appliances in any way.

In the special price list, 62 A, the Jeffrey Manufacturing Co., Columbus, Ohio, take up the subject of water elevators of different styles and sizes, some designed for lifting water from wells, others for irrigating and drainage purposes. The Jeffrey horse powers are also described and illustrated, as also their current driven floating water elevator and elevator conveyor. As with all other publications of the kind noted herein a copy will be sent to any address on request.

Standard size, 6x9-inch, Catalogue No. 4, "Gold and Silver Milling," issued by the Allis-Chalmers Co., Chicago, 276 pages, is a compendium of data under that head. The best thing in the way of description in the present work is the 24-page discussion of the Frue vanner. There are some pointers on sectional machinery for muleback transportation, and how to put a sectional motor together, and a good exposition of amalgamation methods. The simple mention of the fact that there are eighty-nine distinct appliances described, and ninety-seven engravings used in such description, illustrates the collective scope of the book, which deserves a far better title than the ordinary one of "catalogue." The work is superb typographically.

Bulletin No. 1015 of the Denver Engineering Works Co., Denver, Colo., 8x10½ inches, 32 pages, is entirely devoted to electric hoists, and goes into the subject with unusual detail. In this treatise Shepard & Searing have avoided the mistake sometimes made by compilers of electrical machinery catalogues who suppose everybody knows all about those things and who thus omit important points. In the booklet received this week the Denver Engineering Works Co. give a good deal of just that kind of information that often appears in "Concentrates" on the third page of this paper in answer to just such questions. Besides this is given a general drawing of each hoist il-

Cyanide and Stamp Mill Superintendent open for engagement. Graduate A thorough assayer and chemist; also accountant. Speaks Spanish. Will go anywhere. Specialty, construction; also successful treatment of low-grade and slimy ores. References "AL." Address PRACTICAL, care of MINING AND SCIENTIFIC PRESS.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Wheels and Generators at Power Station on Truckee River, Farad, Near Floriston, Cal.; Power and Lighting Transformers on Surface at C. & C. Shaft, Virginia, Nev.; 1750 Station, C. & C. Shaft, Virginia, Nev., Showing Pressure Column for Hydraulic Elevators; 100 H. P. Motor Driving 16½x30-Inch Air Compressor at C. & C. Shaft; Electric Hoist, Showing 200 H. P. Motor and Controller, C. & C. Shaft; Six-Foot Fan Driven by 10 H. P. Motor on the 2150 Foot Level of C. & C. Shaft, Ill. Electric Pumping Station at 2150-Foot Level, 115. The Shattuck Patent Solar Attachment, 116. Internally Fired Boiler; Red Cross Antiseptic Telephone Mouthpiece, 117. Mining and Metallurgical Patents, 118.

EDITORIAL.—Lack of Structural Iron; Progress of Electricity in Mining Operations; Mining Congress at Butte; Tendency to Overdo in Newspaper Business; Working Miners Producing Lead, Silver and Copper; Excessive Taxation in British Columbia; Lead and Smelting Combines; "Gold Production from Low Grade Ores;" Mining Operations Published in Local Papers; Aluminum; Phenomena Associated with Liquids or Gases; The Business of Mining Engineering, 112.

MINING SUMMARY.—119-120-121-122-123.

LATEST MARKET REPORTS.—15.

MISCELLANEOUS.—Concentrates, 113. Treatment of Gold Ore; A New Nevada Mining District; Mint Figures on Mine Yield, 114. Electrical Equipment C. & C. Shaft, Virginia City, Nevada, 115. Experiments on "Fireproof" Woods; The Shattuck Patent Solar Attachment, 116. Internally Fired Boiler; Restricting Inventions by Standardization; Red Cross Antiseptic Telephone Mouthpiece, 117. Oxidizing Agents in Cyanide Mill Solutions; Mining and Metallurgical Patents, 118. Personal; Commercial Paragraphs; New Patents; Notices of Recent Patents; Catalogues Received; Production of Lead; Clifton, Ariz., Mining District, 123.

It is incongruous that on the Pacific Coast great building enterprises are deferred and delayed because of inability to get structural iron from the east, while immense deposits of rich iron ore lie undeveloped and cheap fuel in the shape of oil abounds.

THE progress of electricity in mining and metallurgical operations has been frequently referred to. The general advance in all manner of electrical appliance to business affairs is constantly noticeable. The one item of railway building furnishes illustration. This month there is completed in the United States since September, 1889, 25,000 miles of electrically operated railways, enough to girdle the globe.

INDORSEMENT of an increased appropriation for the admirable work of the U. S. Geological Survey; a concert of unanimous action toward influencing favorable legislation for a Cabinet of Mines and Mining; and a recommendation of Senator Kearns' bill repealing the extralateral feature of the present federal mining law are among the things that next week's mining congress at Butte might do. It might not do much good to endorse those three things, but it certainly could do no harm.

THE resuscitation of old papers and the starting of new ones is of present notice throughout the metal mining region of the continent, showing the growth and vigor of the mining industry. There is always a tendency to overdo in the newspaper business, but the constant additions to the size and number of publications in the principal mining centers is a fine showing for the basic industry that upholds them and makes their existence possible.

WHEN the working miners, producing copper, lead and silver, get their business into the shape that tends to dispense with the combines that now handle their product, they will manufacture the lead into pipe, shot, etc., the silver into spoons and dishes, and the copper into the multifarious forms of commercial use, right where these metals are mined and refined. This sounds a little strange in 1902, but it will not be long, as times go, till the idea is a present reality. In the way indicated lies the largest possibility of profit and the most likely way of escaping the intolerable toll and thralldom that present conditions are fast imposing.

WITH exceeding great cause, British Columbia miners complain of excessive taxation and oppressive

legislation. They show conclusively and in detail that present conditions are in effect that there is an annual tax in that Province of 20% on the gross production of all that goes to make up the mining industry there, and that thus that industry in British Columbia is being taxed to death. It is a marvel that such stupid legislation was ever begun and a still greater wonder that it is allowed to continue. The killer of the goose that laid the golden eggs was a sane and sensible individual in comparison with the legislators who lay such a crushing burden on that Province.

THE lead combine mentioned in previous issues is about an accomplished fact; already there is some talk of legal action as started some time ago in Colorado against the smelting combine. Suits on the part of the commonwealth are only indicative of public feeling, but are not operative nor likely to be. The only practicable business solution of the smelter trust problem, from the standpoint of the producing miner, is independent competition: in the case of the later combination of lead manufacturers, a combination of lead producers. "It is cheaper to combine than to combat," is the cry of those who have formed the late lead combine, and applies equally as well to those who supply what political economists love to call "the raw material."

THE Jernegan-Marshall-Emmens-Brice-Wynn extraction of sunlight from cucumbers and gold from seawater, bricks, silver and sulphur has not exhausted the limits of ingenuity in that direction, the latest being Mr. Neubarth of Leadville, Colo., who casually "produces from low-grade ore, carrying merely a trace of the precious metals, five or six ounces of gold." Mr. Neubarth is proprietor of "a large grocery store," and has a chemical solution in which he places the pulverized ore, producing "oil of gold," from which he subsequently extracts the gold. It appears, according to Grocer Neubarth, that the gold he thus produces is "in an immature state," and knowledge of its unripe condition is not vouchsafed to the ordinary common assayer or metallurgist. If faith consists in believing what you know isn't so, there should be little difficulty in securing converts to this new metallurgical creed, though the experience of the devotees of this latest alchemist is likely to be more interesting than prosperous.

RARELY does this publication proffer advice to brother publishers, but the suggestion is courteously made that in papers published in a mining region might appear mining news. It does not look well to have a column commenting on the lack of appreciation of capital as regards that particular district, and not three lines of news as to what any mine in that place is doing. The natural conclusion would be that if there was any mining going on something would be said about it. Nothing attracts more favorable attention to a mining town or district than reference to such local operations in the local paper. Of course this is written in the assumption that the local paper really wants to attract the attention of "capital," and have something doing. Most newspaper men do, and it is believed that one good way is to devote some space to brief, accurate statement of principal mining operations and news. It pays every way.

ALUMINUM is the third most abundant element found in the earth's crust, of which it constitutes about 8%, yet few minerals can be considered ores of that metal. Cryolite, a fluoride of sodium and aluminum, contains 13% aluminum and 32% sodium, and was used as an ore of sodium, with aluminum as a by-product. On the west coast of Greenland is the only place where cryolite occurs in quantity. At present bauxite is the most commercially profitable of the aluminum ores, large deposits being mined in Arkansas, Alabama and Georgia. The uses of aluminum are constantly increasing, one of the most notable being in the reduction of other metals to the metallic form. In this process the metallic oxides are mixed in a refractory crucible with finely powdered aluminum and barium peroxide, the latter containing an excess of oxygen and being added on top of the mixed oxides and aluminum. A lighted match readily ignites it, and the heat and excess of oxygen as readily ignite the powdered aluminum which at

once oxidizes, this reaction continuing throughout the entire contents of the crucible, the aluminum taking up the oxygen from the metallic oxides and reducing them to the pure metallic state, the mass becoming molten by the reaction. Metals that were formerly considered almost impossible to reduce to the metallic state are in this way so produced with little trouble and expense, forming valuable addition to metallurgy, and furnishing sundry valuable alloys in preparation of iron and steel.

MANY of the phenomena commonly associated with liquids or gases are also manifested by solids under required conditions of pressure and temperature; if sufficient time be allowed, for nature takes no note of time—there being no past nor future, but one eternal now. The solid state is not entirely a condition of inactivity, but one in which change is slow. Recent chemical experiments show that something like the liquid state occur in metals long before they melt. Take, for instance, two cylinders of copper, placed base to base and held together by gentle pressure, the surfaces in contact having been carefully polished and cleaned. If they are heated to about 400° F. for twelve hours—the melting point of copper being 1100°—the union will be found so complete that if the mass be broken the fracture does not pass through the original junction. The effect of pressure is similar. Powdered metals under a pressure of 10,000 atmospheres produce a mass which has every appearance of having been fused. The slight rise of temperature produced by the pressure will not explain this fact. When cylinders of different metals are placed with polished surfaces in contact, and heated gently, they adhere firmly and alloys are formed at the point of junction. Thus with copper and zinc a layer of brass three-fifths of an inch thick is produced at the plane of contact. That copper and zinc vaporize below their melting points is shown by making a depression in a zinc cylinder and covering it with a copper one. When the pair is heated gently for a time, a distinct layer of brass forms on the copper and a brown stain containing copper on the zinc. This is not due to diffusion from the surfaces which are in contact, for when a ring of mica is placed between the two metals the result is the same.

JNO. SMEEON in 1752 was the first man to ever style himself a civil engineer, and in the 150 years the business has ever been growing more and more of an exact profession, till now it is of equal importance with any of the learned professions, and demands as high a quality of intellect. The business of mining engineering has not as yet reached so high a standard, but is destined to surpass it. The old rule of thumb is being rapidly discarded, and the advance is noticeably greater in the last 20 years than in the preceding 130. Like the miner, who has had to grope his way painfully upward, the mining engineer has had to be creative in his functions, and cause a demand before furnishing the correlative supply. The scope of the mining engineer is becoming a tremendous one in variety and requirements. He is becoming the master and interpreter of protean forces, and in his functions combines the powers of many branches of practical science. Indeed, all the modern arts and sciences, so far as they apply to mechanics, come under the domain of the mining engineer, for nearly everything to make up modern mechanical progress comes in somewhere as a part of the great mining and metallurgical industry, whether it be the whole railroad system of ore transportation, the pneumatic method in converters, the best efforts of the electrician, the most complex and far-reaching process of the chemist, the keenest effort of the geologist, the profoundest demonstrations of the mathematician. Thus the educational equipment of the mining engineer is becoming necessarily as much more complex than it was as are the appliances at his command in contrast with the simple devices of a generation ago. And if the demands for capacity and knowledge seem great, it is to be borne in mind that the rewards are proportional and commensurate. No youthful profession on earth pays higher salaries to-day than are paid mining engineers, and the world of great mining enterprises stands ready to pay a man the value he himself sets upon his services, provided he can demonstrate his worth as a matter of economy—economy in this regard meaning the judicious expenditure of money.

Concentrates.

WHEN a side line divides an apex longitudinally, the whole of the apex belongs to the senior locator.

THROUGH a $\frac{1}{2}$ -inch nozzle, under fifty-two pounds pressure per square inch, there would be discharged 13.43 gallons water per minute.

GOLD 750 fine is worth \$15.50 per ounce; 800 fine, \$16.53 per ounce; 850, \$17.57; 875, \$18.08; 900, \$18.60; 920, \$19.01; 930, \$19.22; 940, \$19.43; 950, \$19.63.

THE use of iron in assaying sulphide ores is because of its affinity for sulphur. The sulphide of iron thus formed is fluxed off in the process of the assay.

THE law requires that the surface ground used for residence and business purposes upon a patented mining claim must be assessed at a price approximating its value for such use and purpose.

"LINDLEY ON MINES" was issued by C. H. Lindley of San Francisco, Cal., in October, 1897. It is now out of print, all the published copies having been sold; a second edition will be issued next year.

THE use of vaporized quicksilver to amalgamate gold is not new; it is an old and unsatisfactory expedient, abandoned wherever tried, because commercially unprofitable and hurtful to the health of the men.

TO reduce a 1% cyanide solution to three-fourths of 1% use three ounces solution to one ounce water; to one-half of 1%, two ounces solution to two ounces water; one-fourth, one to three; one-eighth, one to seven.

ARC LAMPS located respectively 200 feet, 300 feet and 400 feet apart will illuminate plane areas about 31,500, 70,000 and 125,000 square feet in extent. A 20-foot road crossing this area would receive respectively 12.7%, 8.6% and 6.4% of the light delivered to the ground.

A "STELLA" is a \$4 gold piece, of which about 500 were coined at the Philadelphia mint twenty-five years ago. They each contain 6 grams gold 1000 fine, three parts silver, seven parts copper. They are worth considerable as curiosities; \$100 has been refused for one.

THE services of a watchman can not be reckoned in the required \$100 worth of work or improvements on an unpatented mining claim. Assessment work is ordinarily estimated by the day's work at the ruling rate of miners' wages in that locality. Trail or road work does not count, nor is any allowance made for time going or coming.

DURING the twenty-one years of unrestricted hydraulic mining in California, it has been figured that about 21% of the debris in the navigable waters of the State was due to the work of the hydraulic miner, the assumption being that the other 79% was due to natural erosion resultant upon agricultural progress and general occupation of the country.

SODIUM DIOXIDE used in connection with cyanide will tend to occasion a greater extraction in a short time—twenty-four to forty-eight hours. With longer periods its use does not appear to facilitate extraction. The effect of the dioxide is to furnish nascent oxygen, which acts on the cyanide to liberate cyanogen, temporarily hastening the reaction.

AS a matter of law, a bank cannot act as the treasurer of a corporation, because that involves personal liability. Corporations in naming banks as the custodians of funds should designate them as depositories and not treasurers. The functions of the two agencies are dissimilar. Those of a treasurer are personal and usually he has no discretion in the handling of funds. The functions of a bank are commercial, solely.

THE Selby Smelting & Lead Co., the Pacific Coast Smelting & Refining Co., the Mountain Copper Co., the United Verde, the Old Dominion are among California and Arizona smelters that use oil fuel in smelting ores. A Los Angeles company is successfully smelting iron with oil for fuel, as related in last week's issue. The Colorado Fuel & Iron Co., and other Colorado concerns, are also using oil as fuel with success.

A COMMUTATOR is a device for causing the electric current in the wire outside of the armature to flow continuously in the same direction, for within the armature the direction of the pressure reverses every time the field polarity changes. It consists generally of a number of tapered strips of hard drawn copper, cast copper, or cast brass, set into insulation on the periphery of a core so that they present a cylindrical surface and are all separated from each other and from the core of the mica insulation.

"CONCENTRATES" could have the work largely lightened by more frequent use of the index and more careful reading of the paper. It is not uncommon to receive a question from California or Colorado or Montana almost precisely similar to one that had been answered not over a month previously. By looking over the indices of recent volumes and keeping a keen eye on current columns of the more recent issues, querists can often find paragraphs at least approximately answering the inquiry they have in mind.

"STANDARD COPPER" is composed of any kind of stuff that may carry 96% fine copper, and much of the visible supply consists of material carrying obnoxious impurities. Should some high-grade bars be found in stock a premium is paid for them. As high as 30 shillings premium has been paid for Chile bars recently.

Standard copper is the speculative article, and under an ordinary contract the seller can deliver any quality of bars, provided they contain 96% pure, hence the premiums paid for choice brands.

LEAD SHEATHING, which is so universally adopted as a mechanical protection for electric cables and wires, is responsible for several faults. In fiber insulated cables the imperviousness of the lead sheathing is the only guarantee of quality, in that a pinhole, extending through the thickness of the sheathing, will ultimately develop into a fault by the entry of moisture at that point. Such pinholes and flaws are frequently caused by the presence of minute quantities of red lead in the bulk of the metal, which passes through the press and ultimately presents the appearance of a small crack or flaw in the surface of the lead.

THE development of the use of electricity during the past few years has created a demand for mica as an insulating material. Much of the small-sized mica, formerly of little value, if not altogether unsalable, now finds a market among electrical manufacturers. Part of this small mica is reported in the sheet mica products, and as it sells for much less than the larger sizes, which are used in the manufacture of heating stoves, lamp chimneys, etc., it has the effect of making an apparent decline in values. On the other hand, part of the small-sized sheet mica used for electrical purposes is reported as scraps, and in this case causes an augmented value.

TO PREPARE a piece of steel so as to file or turn it into any desired shape, it is necessary to soften it before it can be practically worked. To do this, heat to a red heat and bury in a box of sand which has been previously heated nearly red hot. Allow the steel to remain in the sand until cold enough to handle, and it will be very soft. Never follow the practice of some smiths who bury the hot steel in the fire at night, leaving it to cool off after the fire goes out. Such practice is bad. The carbon in the steel is charged by remaining in contact with the hot carbon of the fire, and the metal may not be as good steel in the morning as it was the night before.

FOR making sharp bends in small pipes or bends of any considerable degree of curvature in large pipes the portion to be bent should be heated, avoiding overheating. The best results will be obtained if the heat is not carried above a dull cherry red. It will be necessary to bend and heat several times in making short bends. After heating the portion to be bent the pipe should be placed in a vise as close as possible to the location of the bend, but without grasping the red hot part. The outside of the curve should be cooled with water. The inside will compress with very little tendency to flattening if not bent too far at a single setting. Any slight flattening may be brought back to circular form by squeezing in the vise before it has gone too far.

WHERE the stockholders of a mining corporation, being ignorant of the selling value of their stock, authorize the president of the company to find a purchaser and effect a sale of their shares at par, and such president, at and before such time, was in secret correspondence and negotiation for the sale of the stock, with a view to a large profit by himself, and by affirmative acts and misrepresentations concealed his transactions from the stockholders, and effected a sale of their stock for a sum largely in excess of par, he cannot retain such excess, but must account to the stockholders for the profits made, notwithstanding he had stated to them that he would retain for his services as agent any sum realized above that for which he was authorized to sell.

CALIFORNIA now refines about 250,000 barrels oil monthly. Ordinary distillation products are: Asphaltum, from 10% to 25%; naphthas, such as gasoline, benzine, 10% to 20%; distillates, gas and fuel, 20% to 50%; illuminating and lubricating oils, 20% to 50%. The asphaltum, as a semi-liquid product called maltha, is used as a flux or solvent for the harder natural asphalts in paving; the harder asphalts, besides being so used, also serving for coating steel and iron pipe, in street and interior electric conduits, paints, varnishes, roof covering, etc. The naphthas, gasoline, benzine, etc., are in general use in isolated gas plants and in stoves in homes and factories. The distillates are used by gas companies for direct manufacture or enrichment of gas for use in gas engines or motors, and occasionally in house stoves and furnaces. The illuminating and lubricating oils are in universal use.

In grinding a slide valve which has been in use until hollow places have worn in the surface, emery mixed with water, or sand and water; will be found better than oil, unless a light body oil, such as kerosene, is used. If water is used with the grinding material, soap should be rubbed on hollow places, and the grinding stuff should be applied to the high parts in small quantities, keeping the low parts clean and dry until an even surface is obtained all over; then the worn out stuff should be used for finishing up. In polishing metal, oil that will gum up should not be used with the polishing material, unless for a dead fine polish. In polishing old brass work which has been scratched and tarnished by wear, pumice stone or bath brick should be used with soap and water for scouring off with, and rotten stone with kerosene oil for the wet finish, and dry for the final polish. The same method should be used for new brass work.

DISCUSSION of ore formation is always interesting if not always conclusive. Mining experts and geologists are giving considerable attention to the genesis of ore

deposits. Three important propositions seem to be agreed upon by most of those investigators: that ore bodies are, with few exceptions, essentially surface deposits, that is, confined to a limited zone near the surface of the earth's surface; that the deposits are of late geological formation, probably few dating back before the Tertiary period; that ore bodies are concentrated chiefly by means of circulating waters which have come from below, from above and from the sides. It may seem to be somewhat against the second conclusion that there are veins found in the granite, but the ore depositions in this rock are much later than the geological age in which the granite was predominant. The aqueous theory conveniently fits the facts; few geologists attempt to bring forward any other explanation.

COPPER alloys easily with silver; argentiferous copper is produced in the smelting of argentiferous copper ores, or when silver and copper ores are smelted together. Silver can be separated from copper alloys by electrolysis, or, if treated with mercury, the silver is taken up by the latter metal. If the alloy be melted with lead, a silver-copper-lead alloy is obtained, and if this be heated to a higher temperature than the melting point of lead, a lead-silver alloy flows from it, leaving behind the copper, deprived of the greater portion of silver (liquation). If the silver-copper alloy be powdered and roasted with common salt, the silver is converted into silver chloride, the copper being then present mainly as an oxide. If the alloy be melted with an excess of sulphur, sulphides of both metals are produced (matte); but if an insufficient amount of sulphur is present, it combines with the copper, and silver separates in the metallic state.

THE average coefficient of friction for the moving parts of a haulage system may be taken at one-fortieth of their weight. When this weight is that of both cables, the empty cars passing into the mine and the loaded ones coming out, this coefficient represents the tension of the main rope; while the tension of the tail rope is equal to one-fortieth of the weight of the moving parts when the cars are empty. If the tension of the main rope be multiplied by the velocity of the train in feet per minute, the result represents foot-pounds of work done in this length of time. Then by dividing this by 33,000 gives the horse power required to operate the plant. Thus suppose the line is 2000 feet long, the weight of the main rope per foot is eight-tenths and that of the tail rope six-tenths of a pound. The number of cars in each load is twenty, their weight when empty is 1500 and when loaded 4000 pounds each, while the maximum speed of the train is 10 miles per hour. Then the weight of the loaded train is 80,000 pounds, and that of the two cables 2800 pounds. The tension of the main

rope is therefore, $\frac{80,000 + 2800}{40} = 2070$ pounds. The weight of the train of empty cars is 30,000 pounds, and the tension of the tail rope is $\frac{30,000 + 2800}{40} = 820$ pounds. Now, as the maximum speed of the train is 10 miles per hour, its velocity per minute is $\frac{5280 \times 10}{60} = 880$ feet. The work done by the main rope is, therefore, $2070 \times 880 = 1,821,600$ foot-pounds per minute, or $\frac{1,821,600}{33,000} = 55.2$ H. P.

IN the cyanide process solution of the gold does not take place in the absence of oxygen or an oxidizing agent. It is doubtful whether the efficiency of ferric chloride and halogens is due to their oxidizing power or to their direct affinity for potassium. In most cases with tailings poor with gold and free from sulphides, the air entangled in the ore is sufficient, while with ordinary pyritic tailings oxygen is generally supplied by double treatment, aeration taking place during the draining off of the first solution. The most difficult materials to treat are slimes containing ferrous sulphide, which results from the decomposition of pyrites during the accumulation of the slimes. These slimes must be thoroughly oxidized by mechanical aeration, and, if necessary, by permanganate of potash. On the other hand, too much oxygen means a large destruction of cyanide, and judgment must be used to obtain the most economical result. A dilute solution is as efficient as a strong one if the supply of oxygen be not increased as well as the concentration. With slimy ores, which, owing to mechanical difficulties, require prolonged treatment, there is no necessity to hasten the solution of the gold, and it is better to use a dilute cyanide solution, which suffers less waste, than a strong one. The objection formerly raised, that the gold could not be entirely recovered from a dilute cyanide solution by means of zinc, has been overcome by using the zinc in threads, with a very large surface, and by prolonged contact. The electrical processes for the precipitation of the gold have been of benefit in the treatment of very dilute solutions, but the electrodes must be large and very close together to overcome the great resistance of the dilute liquid. Anodes of iron or lead peroxide and cathodes of sheet lead are used, and it is best to have a slight excess of potassium cyanide present to prevent the precipitation of gold cyanide along with the Prussian blue produced. Very clayey slimes have been successfully treated by circulation as a pulp with very dilute cyanide solution through a centrifugal pump with admission of air, and subsequent settling in large vats, and filtration of the decanted liquid through sand. The solution must be absolutely clear, and a low current density of not more than 0.04 ampere per square foot should be used.

Treatment of Gold Ore.

To THE EDITOR:—The present methods for the extraction of gold from its ores may be classified as follows:

Milling processes.—Milling and amalgamation; milling and amalgamation, followed by concentration; concentration followed by milling and amalgamation.

Chemical processes.—Cyanide leaching, chlorination, bromination.

Smelting processes.—Lead smelting, copper matte smelting, pyritic smelting.

While numerous patented processes have been proposed, those which have proven successful may be considered simply as modifications of the above.

The ores of California, until considerable depth is gained, consist principally of quartz and schists carrying free gold. For these ores the California stamp mill is a successful machine, being an effective crushing apparatus; and as the amalgamation of the gold is simple, this method results in many cases in the saving of from 80% to 90% of the gold contents of the ores. As considerable depth has been gained in many of the mines the ores have changed to sulphides, the result being that the amount of free gold, or gold which can be saved by this simple amalgamation, is much less than in the upper workings. This has resulted in the introduction of vanners, bump tables or some suitable concentrating machinery below the amalgamated plates, to endeavor to save the escaping sulphides which carry a considerable portion of the fine gold. While this method results in an increased saving when handling the sulphide ores, the saving is in many cases far from satisfactory, owing to the difficulty of successfully handling these extremely fine sulphides by concentration.

The surface ores of Colorado are similar to those of California except that the oxidized portion of the Colorado veins extend to comparatively slight depths (frequently less than 100 feet), while the oxidized area of the California veins is generally much greater, extending frequently to a depth of 700 feet. These varying conditions have led to different methods of stamp milling. With the sulphide ores of Colorado, the successful extraction of the gold by amalgamation requires fine crushing and the introduction of amalgamated plates inside of the mortar. The Colorado practice involves fine crushing, and this necessarily results in the production of a maximum amount of slimes. The fine crushing of these ores is essential to effective amalgamation, as the gold is usually extremely fine, and is intimately combined, or associated with the pyrites and other sulphides. This fine crushing is not only an expense, the amount crushed per stamp being much less than in the California practice (about one ton to three tons per stamp per twenty-four hours), but it also results in the production of a large amount of extremely fine sulphides, which generally contain considerable gold escaping amalgamation, thus entailing loss, as they can only be partially recovered by concentration. According to the above classification, the third method consists of coarse concentration followed by amalgamation.

As most of Colorado sulphide ores are extremely friable, fine crushing (as stamp milling) necessarily results in the production of a large amount of slimes, which frequently carry off mechanically large amounts of the precious metals. By coarse crushing and proper sizing, the amount of slimes may be reduced to a minimum. By this method most of the contained particles of sulphides are left in a coarse condition when they can be readily separated from the worthless gangue by comparatively simple and inexpensive means.

After the separation of these heavy sulphides, the tailings, should they carry precious metals (which is often the case with Colorado ores), are in the best possible condition for treatment by amalgamation. They are already quite finely pulverized, and, as most of the heavy sulphides have been removed, they are in ideal condition for treatment in a California stamp battery.

After this treatment, with many of Colorado ores the tailings from amalgamation will still contain considerable sulphides which were originally finely disseminated through the gangue. A portion of these, together with their precious metal contents, may be saved by passing the material over vanners, bump tables, buddles or other suitable slime-concentrating machines.

I have not seen anything in the MINING AND SCIENTIFIC PRESS of late concerning this important question of rapid-drop or slow-drop crushing. It is a matter of constant interest to millmen everywhere.

Black Hawk, Colo., Aug. 16. R. E. W.

So much has been said and sung thereon that anything new now would not be good and anything good would not be new.

This subject has been well threshed out, and it is difficult to add anything of value. The California free-milling gold quartz doesn't need the fine comminution required by some Colorado ore. A cracking of the quartz to liberate the small particles of gold in most cases suffices in the case of free-milling gold ore of that type, whether it be in California or elsewhere.

The matter is a good deal like the question of

Cornish pumps vs. underground pumps. The writer has worked where nothing but a Cornish pump was deemed worth considering, and, also, where a Cornish pump wouldn't be allowed on the place. It is the old principle of suiting the process to the ore, not the ore to the process. Whatever pays best—that is the best to use.

It is believed that the best thing written of late years on this subject from a California standpoint was a lengthy monograph on stamp mill practice by Dana Harmon of Nevada Co., Cal., which with several illustrations appeared in full in the issue of Dec. 2, 1900. That issue is now, however, out of print.

A New Nevada Mining District.

Through the courtesy of Mr. H. F. Lange of San Francisco, Cal., is published herewith some data concerning the new mining district in northwestern Nevada. This, it is believed, is the first authentic information of the kind regarding that region:

Donnelley mountain mining district lies on the western slope of one of the foothills of the Blackrock range, variously known as Donnelley mountain, Cold Spring mountain or Division peak, in the county of Humboldt, State of Nevada, at an elevation of from 7500 to 8200 feet above sea level, and approximately at township 40 north, range 25 east, Mount Diablo base and meridian.

It is reached from Amadee, or Hot Springs, on the Nevada, California & Oregon Railroad, by team or saddle, the distances between water or stopping places being as follows: Hot Springs to Mape's ranch 4½ miles, + 20 miles Mud Spring or Bull's, + 5 miles Rush creek, + 2 miles Smoke creek, + 10 miles Sheephead, + 6 miles Salt Marsh, + 20 miles Deep Hole (or + 18 miles Walled Spring and 6 miles Deep Hole), + 25 miles Granite creek, + 25 miles Donnelley mountain; total, 117½ miles, or from Humboldt, Nev., on the Southern Pacific, via Rabbit Hole Springs, a distance of 80 miles. The roads are first-class, the water of good quality and sufficiently abundant to obviate the necessity of hauling same for the use of stock.

The surface of the country is largely formed by the dried basins of former great lakes. From these plains numerous parallel mountain ranges, having a general north and south course, rise to a height of from 1000 to 2000 feet. The plains are alkaline, barren and waterless, but springs of pure water are found on the hillsides, carrying in some instances 100 (Granite creek) to 150 (Cottonwood creek) miners' inches, but more frequently 3 to 7. The bench lands are free from alkali and of surpassing fertility, and wherever irrigated yield phenomenal crops of timothy and alfalfa, while in its natural state the entire country affords excellent grazing, and many thousand head of beef cattle and range horses are annually reared for market. No timber is found near the mines, but the homely sagebrush is abundant and is suitable for fuel, often growing to the thickness of a man's thigh. The Mahogany range, 15 miles to the westward, is well covered with the timber which gives it its name, and the trees are said to average 12 to 14 inches in thickness and 20 to 30 feet in height. A sawmill is at Surprise valley, 50 miles north, at which a fair quality of pine lumber is furnished.

At Deep Hole and Clear creek, 3 miles apart, and at Granite creek and Cottonwood creek, 2 miles apart, are the ranches of the Gerlach Cattle Co., each comprising several hundred acres of cultivated land, including orchards and vegetable gardens, which might supply the needs of a mining camp. At present a weekly stage runs from Amadee as far as Deep Hole, and a postoffice is located at that point.

The general formation of the country is granite with an occasional dike of porphyry and some lime. Overlying this is a heavy capping of lava from 2 to 30 feet in thickness. This flow is irregularly distributed and the underlying formation is frequently exposed.

The veins are true fissures and from 1 to 4 feet in thickness. Although at some points they appear to lie in blanket form, all have a uniform dip of, approximately, 40° to the northeast and a strike nearly northwest and southeast.

The veins developed in the district at the present time are four in number, known respectively as the Donnelley, Perry, Antelope and O. K. The ore is free-milling quartz, showing some galena and pyrite, much of which is oxidized. The walls are well defined, but no gouge has been developed at any point.

The Donnelley lode was first to be discovered and is the one farthest to the east. It is from 12 to 16 inches wide and can be traced on the surface for more than one-half mile. In character of ore this lode differs somewhat from the others of the district, the white quartz frequently inclosing fragments of a brownish or black color apparently identical with the neighboring lava. The latter are heavily impregnated with fine gold and contain many specimens of great beauty, having a value of several thousand dollars per ton.

Owing to the occasional coarseness of the gold, it is difficult to secure a homogeneous sample of the entire ledge, returns of fabulous richness being often

received. It may be safely assumed, however, that these fragments will in no instance reduce the value of the whole. An average of four samples, taken across the ledge, representing a length of 200 feet on the vein, gave a trifle over \$57 per ton. In taking these only the quartz was disturbed, the spots previously referred to being carefully avoided.

At this point the granite juts out in the form of a hogback, from which the lava has been denuded. Across the hogback the vein crops strongly for a distance of several hundred feet. A considerable amount of quartz has broken from the ledge and is scattered along its course, and the surface dirt gives large prospects in the horn-spoon. At the time of the writer's visit two holes had been sunk to the required 10 feet. These being perpendicular, they had passed through the vein close to the surface, making the development practically zero.

After passing through the vein the holes showed several seams of quartz of an inch or less, all of which carried gold. The granite was solid and unbroken, but the feldspar more or less kaolinized, the rock crumbling readily in the fingers.

With, as has been said, no development, there were at a conservative calculation 200 tons of ore in sight, the value of which is not less than \$10,000.

The extension of this lode to the southeast is equally undeveloped and, owing to the lava cap, nature has not assisted its appearance.

The Perry lode or system of veins lies parallel to the above and about 700 feet west on the slope. This is the largest body of ore yet developed, the main vein being nearly 4 feet in width and several others cropping within a few feet, in widths of from 10 to 18 inches.

No developments had been made on the vein, but it is strong, permanent and readily traceable and two samples taken from the largest fissure at apparently promising points yielded respectively \$9.23 and \$37.62 to the ton. All the branches of this lode prospect well in the pan.

Mint Figures on Mine Yield.

G. E. Roberts, Director of the Mint, has issued his final estimate of the production of gold and silver in the United States during the calendar year 1901. According to Mr. Roberts' statement that year the United States produced 3,805,000 ounces of gold, valued at \$78,666,700—a decrease of \$504,300, or 0.636%, as compared with the year of 1900.

Ten of the nineteen States and Territories yielding gold showed an increased production, California giving an increase of \$1,075,200. Nevada showed a gain of \$957,600, South Dakota a gain of \$301,900, Idaho \$144,600, and Oregon \$123,400.

Alaska produced \$6,932,226 gold and \$66,499 silver. In 1900 the gold production of the Territory was \$8,166,187 and silver \$96,739. The decrease was due largely to a falling off at Nome on account of the short season and litigation. Out of the total gold production of the Territory \$4,110,712 came from Nome, with \$20,979 in silver. In 1900 Nome's gold and silver production was \$5,109,000. Southeastern Alaska produced last year \$1,981,775. The output of the Yukon, including the Klondike, received in the United States, was \$17,752,463 gold.

Colorado diminished \$1,139,900, a fact explained by the decline in the grade of ores extracted, the tonnage having increased. The silver yield for 1901 amounted to 55,214,000 ounces, of the commercial value of \$33,128,400, which was 2,433,000 ounces, or 5% less than it was in 1900. The greatest gain, 1,493,200 ounces, was in Utah, almost all of which came from the Park City district.

Nevada, New Mexico and Washington also made gains. The production of Colorado, owing to the decline in the grade of ores extracted, fell off 2,046,100 fine ounces, while Montana's yield diminished 1,063,700 ounces, Idaho's 886,200 and South Dakota's 458,200.

The total value of the precious metal produced by the United States in 1901 amounted to \$111,795,100, which was \$1,964,100, or 2% less than the yield for 1900.

The following statement shows the approximate distribution by producing States and Territories of the product of gold and silver in the United States for the calendar year 1901:

State or Territory.	Gold value.	Silver, commercial value.
Alabama.....	\$ 3,100	\$ 60
Alaska.....	6,885,700	28,740
Arizona.....	4,083,000	1,687,440
California.....	16,891,400	555,360
Colorado.....	27,693,500	11,602,680
Georgia.....	124,500	240
Idaho.....	1,869,000	3,327,540
Michigan.....	30,800	48,000
Montana.....	4,744,100	7,879,020
Nevada.....	2,963,800	1,087,500
New Mexico.....	688,400	338,040
North Carolina.....	55,500	12,180
Oregon.....	1,188,100	96,000
South Carolina.....	46,700	120
South Dakota.....	6,479,500	46,800
Texas.....	600	283,440
Utah.....	3,680,200	6,648,480
Virginia.....	5,300	420
Washington.....	280,500	260,600
Wyoming.....	12,700	12,800
Totals.....	\$78,666,700	\$33,128,400

Electrical Equipment C. & C. Shaft,
Virginia City, Nevada.*

By LEON M. HALL, Consulting Engineer.

When mining properties on the Comstock lode were first developed, operations were carried on by steam-generated power, wood being used as the fuel—very costly on account of its scarcity. The milling was until recently done 15 miles from the mine, on the Carson river, where cheap water power could be obtained. About two years ago the question of electrical transmission for supplying power for deep mining operations on the Comstock lode was taken up, and since then extensive hydraulic power has been produced at Floriston, Cal., on the Truckee river, power being transmitted 35 miles to the mines in Storey county, Nev., where a dozen or more properties have been equipped with electrical machinery. Among these is the C. & C. shaft of the Con. Cal. & Va. M. Co., which has a world-wide reputation as a bullion producer.

The power plant on the Truckee river is about 2

designed for a 4% drop under full load. The generating station at Floriston is constructed of brick, with a galvanized iron roof, and the sub-station at Virginia City is entirely covered with corrugated galvanized iron.

The plant has been in continuous operation since Oct. 20, 1900. The Truckee River General Electric Co. sells power to the various mining companies at \$7 per horse power per month, the amount used being based on a maximum peak load of two minutes duration. This, with other conditions, has made advisable the installation of machinery of the highest grade and the introduction of some features unique in character. In the C. & C. shaft at Virginia City every precaution has been taken to secure thorough reliability and the highest efficiency, and, after giving brief outline of the machinery in use, I will elaborate upon some of the more important features, as partially illustrated on the front page.

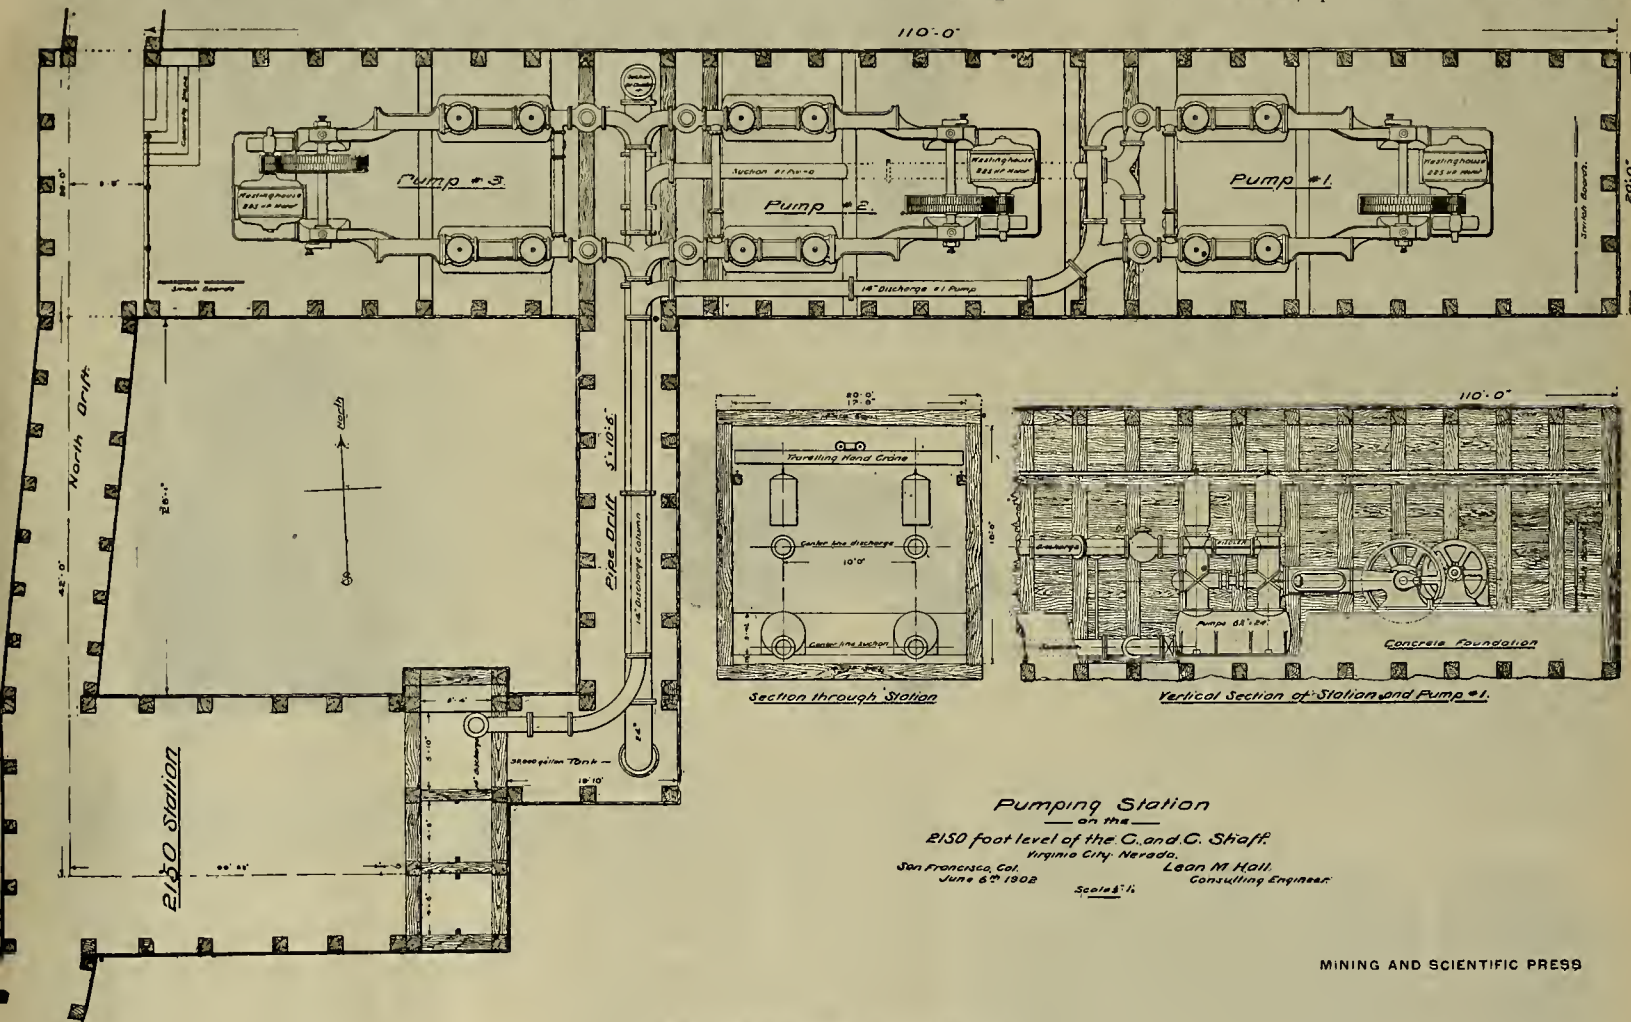

The electrical machinery in operation on the surface consists as follows:

A 200 H. P., type "F," 2200-volt, variable speed, 3-phase Westinghouse induction motor, geared to balanced electric hoist, which will be described later; a 100 H. P., type "C," 2200-volt Westinghouse in-

ply the motor and lightning circuits within the mine.

There are 250 16-candle power incandescent lamps scattered through the workings underground. A No. 6 B. & S. 3-conductor, lead-covered cable, armored with iron wire, extends from the surface to the 2150-foot level, and a No. 0, 3-conductor cable to the pumps on the same level. The weight of the No. 6 cable is six tons and of the No. 0 cable ten tons. The cables were lowered down the shaft by means of the hoisting rope and then securely clamped to the wall plates. At each station a watertight junction box is used and the lead covering sweated into a tight-fitting sleeve located in the side of the box.

The power is brought into the works over two separate circuits, each of which is provided with a single-pole switch at the entrance of the building, and, also, a Westinghouse integrating wattmeter, with its transformer. The pump circuit is further equipped with an ammeter, a frequency indicator, a power-factor indicator and a static ground detector. Oil-break switches are used on the cable circuits and upon all of the 2200-volt motors. The smaller motors, both on the surface and underground, are equipped with auto-starters, quick-break switches and slate-

MINING AND SCIENTIFIC PRESS

Electric Pumping Station at 2150-Foot Level.

miles east of Floriston. The river is dammed just below the Floriston Pulp & Paper Mill and the water is conveyed about 600 feet through a canal and then 8600 feet through a wooden flume, 6 feet 8 inches high and 10 feet wide, to a point directly above the generating station. It is then conducted through two wooden stave pipes, 160 feet long and 6 feet in diameter, to the wheels, upon which there is a head of 84½ feet. There are two pairs of 27-inch horizontal McCormick turbines, direct connected to Westinghouse 3-phase, 60-cycle generators of the revolving armature type. These generators are separately excited by two 22½ K.W. direct-current machines. The wheels will each develop 1400 H. P. at 400 revolutions per minute, with the above head of water. They are regulated by two type "B" Lombard governors. Current is generated at 500 volts and is raised to 24,000 volts by means of six 300 K.W. Westinghouse oil-insulated transformers, at which potential it is transmitted 33 miles over a double circuit of No. 4 hard-drawn copper wire to the sub-station at Virginia City. The line is composed of square redwood poles 30 feet in length, with pine crossarms and locust pins, upon which are mounted 7½-inch Locke insulators. The telephone circuit is carried on the same poles by oak brackets with pony insulators. At the sub-station at Virginia City the potential is lowered to 2300 volts by means of six 450 K.W. Westinghouse oil-insulated transformers, and at this potential current is distributed to the various mining companies. The distribution circuits are composed of weather-proof wire and are

duction motor, belted to a 16½x30-inch single-stage air compressor; a 30 H. P., type "C," 440-volt Westinghouse induction motor, operating circular saws; a 15 H. P. motor of the same type, driving tools in the machine shop; a 10 H. P., type "C," motor, operating a Blake rock breaker at the ore bin; three 15 K.W., indoor type, Westinghouse transformers, transforming from 2200 volts to 440 volts; one 5 K.W. Westinghouse lightning transformer, transforming from 2200 volts to 110 volts; two Manhattan arc lamps; fifty incandescent lamps, together with necessary lightning arresters, fuse blocks, cut-outs and switches.

The apparatus underground consists of the following: A 15 H. P., type "C," induction motor, operating at 440 volts and driving a fan on the 250-foot level; two 10 H. P. motors of the same type, driving fans on the 1950-foot and 2150-foot levels; three 225 H. P., type "C" motors, operating at 2200 volts, and geared to three duplex double-acting Reidler pumps, located on the 2150-foot level; three 10 K.W. type O. D., transformers, transforming from 2200 to 440 volts, located on the 1750-foot level; a 3 K.W. lightning transformer, transforming from 2200 volts to 110 volts, on the same level; three 15 K.W., type O. D., transformers, transforming to 440 volts, on the 1950-foot level; two 5 K.W., O. D., lightning transformers, transforming from 2200 volts to 110 volts, on the same level; three 10 K.W. transformers, transforming to 440 volts, on the same level; a 5 K.W. lightning transformer, transforming to 110 volts, on the same level.

These are all Westinghouse transformers and sup-

base fuse blocks. Some of these machines are located in warm places and operate under severe conditions.

The entire installation is wired with lead-covered cables or with rubber-covered copper wire mounted on glass insulators or porcelain knobs. The greatest care is used in installing the wiring, with the result that it is safe and gives absolutely no trouble. Candles have been entirely discarded, incandescent circuits having been carried directly to the working faces and into the stopes. The current is taken into the mine at a potential of 2200 volts through the cables above mentioned, and the potential is lowered in the mine by transformers, which are located as near as possible to the point of consumption.

The compressed air plant, supplying air for drilling, a number of underground hoists and the hydraulic pump, consists of a 16½"x30" Rand & Waring single-stage air compressor, driven at seventy-three revolutions per minute by a 100 H. P., type "C," Westinghouse motor. The motor speed is 580 revolutions per minute, which is reduced by a counter-shaft with wooden rim pulleys and rubber belting. No automatic regulator is used at the present time, as the compressor is working to its full capacity and the motor is developing 96 H. P.

The electric hoist is a decided departure from usual practice in deep-mine hoisting plants and embodies what is commonly known as the balanced, continuous or tail-rope system. This was adopted in order to reduce the cost of operation and, also, the size of the motor to the lowest size compatible with the duty required, viz.: to hoist 500 tons daily from

*See illustrations on front page.

the 2500-foot level by means of double-deck cages carrying 3600 pounds of rock. The hoist consists essentially of a main driving drum and an idler, around which is wrapped a 1½-inch plow-steel wire rope. The rope passes down one compartment, around a movable tail sheave and up the other. One cage is inserted between the ends of the rope and the other fastened to it by means of heavy iron clamps. The main driving drum is geared to a 200 H. P., type "F," variable-speed Westinghouse 3-phase induction motor, which operates at a maximum speed of 580 revolutions per minute, moving the cages through the shaft at 1250 feet per minute. The speed of the motor is readily controlled by means of variable resistances inserted in the secondary winding, but external to the motor itself. The variation of the resistance is accomplished by the use of a special controller, resembling an ordinary street car controller; the primary circuit is controlled by means of an oil-break switch. The hoist is equipped with heavy post brakes, hydraulically operated, and the machine is handled with remarkable ease. In tests that have been made, these hoists show a net efficiency of about 75%, counting all electrical and frictional losses. The pumping plant consists of three duplex double-acting 6½"x24" Riedler pumping engines, located on the 2150-foot level. These pumps take their water supply from a tank on the east side of the shaft just below the 2150-foot station. Each pump is separately driven by a 220 H. P., type "C," 2200-volt Westinghouse induction motor, and has a capacity, at 110 revolutions per minute, of 1500 gallons per minute to the height of 450 feet, or to the Sutro Tunnel level. The motors run at a speed of 495 revolutions per minute, the necessary reduction being obtained by the use of cut gearing with stepped teeth. The total capacity is 4500 gallons per minute and is intended to take water from the hydraulic elevator as long as it is used as a sinking pump.

The pumps are located in a station 30 feet north of the shaft. This station is cut from the solid rock and is 18'x17'8" in section and 110' long. It is timbered with 14"x14" pine timbers with 3" planking. A drift 5'x10'6" in section connects it with the shaft and ventilation is obtained by means of a small, electrically driven blower. The motors are all wired with lead-covered cable and the station is lighted with incandescent lamps. A 10-ton hand crane travels the entire length of the station, so that the labor of handling and installing machinery has been reduced to a minimum.

This plant is undoubtedly one of the best and most complete mining installations in the world, and its operation has been entirely satisfactory, both in regard to economy and reliability. Up to the time when electrically transmitted power was adopted, the cost of motive power was never less than \$20 per horse power per month, while under existing conditions it is reduced to \$7. For example, the cost of operating the 100 H. P. air compressor usually averaged about \$1800 per month, while to-day it is only \$672. The entire plant was installed according to my plans and specifications and under the able direction of Superintendent Jos. R. Ryan. It has proved an unqualified success from the very beginning.

Experiments on "Fireproof" Woods.

A series of experiments with "fireproof" woods was made in the heat laboratory of the Massachusetts Institute of Technology last week, the first practical work of the new school of insurance engineering. The tests were conducted by C. L. Norton of the institute and several assistants, the insurance engineering school being especially represented by E. Atkinson, its director.

To begin with, samples of different kinds of wood in their natural state and after treatment by various fireproofing processes were held in the flame of a Bunsen burner which gave a heat approximating 3500° F. In a general way, the prepared wood burned less freely while it was in the blaze and glowed a shorter time after it was taken out of it, but in the end both kinds showed about equal consumption. Fireproofed pine suffered a less percentage of consumption than plain pine—a proportionately greater difference than was shown by oak. The best of the prepared samples lost all trace of flame within from one to ten seconds after being removed from above the burner, while those in their natural state continued to blaze, and afterwards to glow, for some minutes.

A test to determine the comparative length of time in which two sticks, one of which was fireproof and the other non-fireproof, would burn through showed that, in general, the treated wood lasted about a minute longer. When subjected to heat in a furnace even the most enduring of the prepared material was turned to charcoal.

These experiments were made with small bits of wood. To determine the effect of fire on large pieces Prof. Norton placed over furnaces, for five minutes, two boxes without ends—one 28 inches long and 3 feet square, and the other a little shorter; one of whitewood and one of pine, and each treated with a different fireproofing process. Although the pine box charred inside it ceased to burn soon after the fire was withdrawn from beneath it. The whitewood, however, continued to glow, and in time the lower

part turned away and a hole appeared in one side, and the effect on a hardwood box was similar. When dropped on a plate of red hot iron the fireproof woods only charred at the point of contact, while the untreated woods blazed; but in an electric muffle, where heat of about 1800° F. was supplied on all sides, none of the fireproofing processes gave sufficient protection to enable the samples to resist the flames.

For a final experiment two coh houses were built, each of eight tiers, one of fireproof sticks and the other of non-fireproof. In both all kinds of woods and all the different methods of treatment were mingled. Fire was applied to each for five minutes. The house of untreated wood broke into flame quickly and at the end of five minutes was wholly ablaze, while the fireproofed house was untouched above the fifth tier and even that part which had caught was not burning readily. The untreated wood burned considerably longer than the fireproofed, standing less than five minutes after the fire had been withdrawn, while the structure of prepared blocks remained upright for ten minutes. After the houses had fallen the plain wood continued to blaze considerably longer than the other.

It was developed that samples treated with fireproof paint withstood the attacks of the flames fully as well as those treated with solutions that completely soaked the fibre.

The Shattuck Patent Solar Attachment.

Wm. Ainsworth & Sons of Denver, Colo., have placed upon the market a new and improved solar attachment, designed and patented by O. F. Shattuck of that city. The attachment is arranged to fit over the objective end of the telescope in place of the cap, to render it easily detachable and designed to make it unnecessary to send a transit to the factory to have it fitted, provision being made for an engineer to give the accurate dimensions required and place his order when in the field, effecting a saving in transportation charges and time.

FIG. 1.

This solar attachment is designed by its makers to overcome by its optical construction the polar adjustments sometimes so difficult to maintain, being dependent only on the accuracy of the vertical arc and limb, the two most carefully constructed parts of the transit, giving results commensurate with the accuracy of the instrument to which it is attached.

Fig. 1 shows the attachment three-fourths actual size. For instruments having no vertical arc, a latitude level is provided at small expense.

The manufacturers say the reliability of the solar attachment shown herewith depends upon principles similar to those of the sextant, i. e., that a ray of light which suffers reflection twice in the same plane is bent at an angle with its original direction equal to twice the angle between the two reflecting surfaces.

FIG. 2.

Referring to Fig. 2, which is a sectional view in the plane of the attachment about three-fourths actual size, the main frame AA carries the stationary mirror H and revolves axially by means of a bearing in the cap B, which fits over the objective end of the transit. C is a clamp ring used in connection with the clamp and tangent screw (not shown) for rotating the frame AA about its axis. The movable mirror I is adjustable to any required angle, being mounted on a swinging arm D, which is provided with an adjusting screw E, a graduated differential nut F and a clamp G.

The ray of light enters from above, as indicated by the arrow, and is incident upon the movable mirror I. It is thence reflected to the stationary mirror H, thence in through the object glass to the cross wires of the instrument. Thus the maintenance of the

angle between the incident and emergent ray depends upon the angle between the mirrors rather than upon the polar bearing.

The declination angle corrected for refraction is set off by means of the movable mirror actuated by the screw E and the differential nut F, the method being to sight at some object on the horizon (B, Fig. 3), with the solar attachment off, the telescope level and the vernier set at zero. Then with the lower plate clamped and the vernier set at the south

FIG. 3.

polar distance, corrected for refraction, which has been previously computed, sight at the same object (B', Fig. 3), with the solar attachment in place, bringing the object onto the cross wires by means of the adjusting screw E and the differential nut F.

Then, referring to Fig. 3, angle CDB' equals angle CAB. If the object sighted be less than 5000 or 6000 feet distant, allowance is made for parallax by making the distance BB' equal to the distance from the axis of the telescope A to the optical center of the solar attachment.

Now depress the telescope to the latitude of the place of observation (see Figs. 4 and 5), revolve the solar about its axis and the transit in a horizontal plane until the image of the sun is brought to the proper position on the cross wires. The line of collimation then becomes the polar axis with the transit in

FIG. 4.

the meridian, and the solar revolved about its axis will follow the path of the sun. The engineer, having carefully set off his angles, and knowing that his transit is in adjustment, is assured of reliable results.

FIG. 5.

Fig. 4 shows an operator making an observation to determine the meridian. Fig. 5 is a graphic illustration of the same when the sun's declination is north 11° 26', A being the axis of the telescope and PP' the polar axis, coincident with the line of collimation.

After the transit has been set in the meridian the reading of the differential nut is taken and the attachment is removed. It weighs less than three ounces and may be carried in the pocket without fear of damage. In taking subsequent observations during the day as a check on the work, it is only necessary to set off the hourly change in declination by means of the graduated differential nut, each division of which represents one minute of arc, place the attachment in position, and if the instrument be in the meridian the sun will come to the proper position on the cross wires. The manufacturers say that another valuable feature of this solar attachment is its adaptability to underground surveying. In connection with the delicate level under the transit telescope, it is especially useful in carrying accurate traverse lines up or down shafts or steep inclines in the same manner as with side and top telescope.

A catalogue giving complete description will be mailed on request by Wm. Ainsworth & Sons, sole manufacturers, Denver, Colo.

Internally Fired Boiler.

The Holthoff Machinery Co. of Cudahy, Milwaukee county, Wis., have put upon the market an internally fired boiler, with Morison suspension furnace, as illustrated herewith, which they are building to meet the demand for a boiler that will occupy small space and in which the necessarily high pressure steam can be economically generated.

It will be noted that the boiler is somewhat similar

Internally Fired Boiler.

in general design to the Scotch boiler so extensively employed in marine use. The boiler requires comparatively little floor space and head room, is self-contained, requires no external brick work, possible complications incident to a brick setting being thus obviated, the only brick work required being the combustion chamber, which is lined with one layer of fire brick to prevent the escape of heat through the rear wall, and which becoming white hot maintains an even temperature, insuring combustion of the gases and tending to prevent smoke. The manufacturers say the internally fired boiler is economical in the consumption of fuel, because there is no brick work to absorb and radiate the heat; the furnace is surrounded by water and the heat of combustion is more fully utilized than is possible in externally fired boilers.

The corrugations in the Morison furnace are designed to be of sufficient strength to withstand the crushing strain present in every high pressure boiler, and tend to serve as haffle plates on the interior of the furnace, retarding the progress of the flame and gases and facilitating combustion. These corrugations in the Morison furnace are a series of expansion joints, designed to relieve strain on the rivets in the head.

The internally fired boiler is built in sizes of 75, 100, 125, 150, 200, 250 and 300 H. P., and for pressures of 100, 130, 160 and 200 pounds per square inch, the larger sizes being equipped with two furnaces. The design, however, is susceptible of modifications by the manufacturers to meet special conditions.

By-Products From Rand Stamp Mills.

In the process of amalgamation are the inside copper plates, the screens through which the pulp passes and the outside copper plates, brushes and rags that are used to clean the plates with, the screen frames, mortar hoxes, shoes and dies; all these come in contact with the gold and quicksilver and take up more or less amalgam. The ordinary clean-up gives the plate scrapings, which contain, besides the gold amalgam, particles of iron, sand, iron pyrites, especially magnetic iron pyrites when present, bits of copper, sometimes a little grease, and various colored metallic films that spread over the plates as a result of the decomposition of pyrites and other sulphur compounds. This amalgam is then cleaned by grinding and washing, generally in an amalgamating barrel with various chemicals, such as lime, cyanide of potassium, and other chemicals special to the individual amalgamator. Into this barrel is also put the ashes which result from the burning of the chips, rags, brushes, scalings from the screens, the cleanings around the dies, and all the odds and ends around the amalgamating room that may contain a little amalgam. As a rule, this harrel is a grinding barrel, and its products at the finish of the operation are clean amalgam, fine silica, slime, and water containing various chemicals. At many of the best mills, when the harrel is empty, all these various products

are saved, because complete amalgamation of all the gold contained in the harrel has not by any means taken place. Some of the quicksilver has been floured, some of the hard amalgam has been ground up into an impalpable powder, and in the grinding up of the pyrites some of the amalgam adhering to the fine grains of pyrites is floured. Where cyanide has been used, which is frequently the case, some of this floured gold has been dissolved. Hence, besides looking after the amalgam from this barrel, the sands and slimes should be carefully settled and the water drained into a collecting

5.33 cents, and so on. The better the quality of the road the less the cost in transportation, so that it is economy to build good roads.

Restricting Inventions by Standardization.

It is a mistake to think that what is now known in the industrial world as standardization has arisen from the development of modern machinery. Primarily, standardization is the attempt of the human race to save brains, which are dear and scarce, at the expense of hands, which are cheap and plenty. The first set of flint arrowhead makers in the palæolithic age were artists and inventors; the second set were artistic imitators of the first set; the third set were common laborers making the standardized article by rule of thumb.

Modern standardization of machinery was made possible by the manufacture, by Sir Joseph Whitworth, of measuring instruments of sufficient accuracy to make the variation between like parts turned out from the same machine not more than one-thousandth of an inch. The standardization of parts is an economical gain so long as its practice does not operate to prevent designs based upon new inventions from being carried into effect on account of the cost of their production in upsetting existing standards.

But it must not be forgotten that, looked at from one point of view, standardization is equivoction so far as the standardized part is concerned. Imagine, for example, a newly invented screw machine which would turn out screws at half the present cost, but only at a pitch different from the standards now in use. It would take years of effort and a lavish outlay of capital to overthrow the vested interests which have grown up around the present standard pitch of screws. Moreover, in the broadest sense, the industrial unit which runs to as nearly as possible complete standardization of its products is in great danger of having ultimately a set of automaton turning out its work. So that when improved processes, demanding intelligent skill, come up, the unit is found wanting in flexibility and adaptability, and is, therefore, easily passed in the race by some younger rival which has not had the chance to make standardization a fetish.—E. H. Mullin, in *Cassier's Magazine* for September.

Red Cross Antiseptic Telephone Mouthpiece.

Description: A shows the outer shell of vulcanized rubber or other suitable material broken in places to expose the inner perforated lining B. C shows bell or front of the mouthpiece, natural size, and also perforations in the inner shell or lining, through which moisture from the breath or other impurities, typhoid or consumptive germs, or bacteria of any kind pass through a receiver F, pierced by two holes D, on opposite sides into a cup E, containing antiseptic material, by which all offensive germs are instantly destroyed or rendered harmless. G shows the

threaded vein connecting the inner and outer shells of the mouthpiece proper, inside which is a perforated disk H, which in combination with the wire screen I, connects the mouthpiece with the diaphragm of the telephone, preventing the lodging thereon or in the recesses of the instrument of dust, insects or filth of any kind. This has been patented by W. English and G. A. Burns of San Francisco, Cal.

The cost of moving one ton by horse power over 1 mile of dry, sandy road is 64 cents; over wet sand, 32 cents; over ruts and mud, 39 cents; over an earth road, dry and hard, 18 cents; over a broken stone road in good condition, 8 cents; over a compact gravel road, 8.8 cents; over wood or stone paving,

An industrial exhibition is to be held at Johannesburg, South Africa, to embrace mining machinery, motive powers, tramways, etc. The arts and sciences will also be represented. It is designed to be "the largest gold exhibition the world has ever seen."

Oxidizing Agents in Cyanide Mill Solutions.

Written for the MINING AND SCIENTIFIC PRESS by J. T. TERRY, JR.

Very little has been written regarding the use of oxidizing agents in cyanide mill solutions, although it is well known that oxygen is essential for the dissolution of gold in cyanide solutions and that oxidizing agents hasten and improve the extraction of the precious metal.

In experimenting of tailings assaying about \$8 per ton that were being treated by the intermediate filling process, with solutions from $\frac{1}{10}\%$ to 1% KCN, the best results were obtained with a $\frac{1}{10}\%$ KCN solution extracting 70% of the value with a consumption of $\frac{3}{10}$ to 1 pound of KCN per ton of ore treated. By the addition of two ounces of sodium peroxide per ton of ore to the solution the extraction was never less than 90%, but the consumption of cyanide increased to nearly two pounds and the zinc consumed averaged one and one-half pounds per ounce of gold precipitated. The precipitate recovered assayed approximately \$35 per pound avoirdupois, whereas it had been about \$80 when the ore had been leached with simple potassium cyanide solution.

Although the addition of sodium peroxide increased the extraction, it caused the fouling of solution to a certain degree, as it became dark-brown and turbid, owing possibly to the action of the caustic soda on the wood and filter cloths. Considerable floured mercury in the tailings was oxidized and dissolved by the solution precipitated on the zinc, causing it to become brittle and choke the screens. After making experiments with other oxidizing agents, such as potassium chlorate, nitrates, permanganate and calcium hypochlorite, I found the latter to give very satisfactory results and without any of the objections met with in the use of sodium peroxide and I am now using this agent in working a twenty ton leaching plant. The ore is crushed in Huntington mills through forty-mesh screens and pulp run into oblong cement settling tank, 8 feet wide, 30 long and $2\frac{1}{2}$ deep, the slime-water escaping over a baffle board and running to a slime pond. The sand is shoveled over the edge directly into the leaching vats, there being three of these, 14 feet diameter by 4 feet, and drained. Chloride of lime (bleaching powder), amounting to one pound per ton of ore, is sprinkled over the surface and the cyanide solution run on the displaced moisture is allowed to run off through a drain pipe till it shows cyanide and it is then directed to the weak sump. The strength of the solution I now use is $\frac{1}{10}\%$ KCN to $\frac{1}{100}\%$ KCN. The extraction is remarkable, after twenty-four hours contact being from 95% to 98% of the assay value, with a consumption of one pound KCN per ton of tailings, the consumption of zinc about one pound per ounce of gold recovered and the precipitate assaying about \$49 per pound avoirdupois. The precipitation is practically perfect and is effected in the first, second and a very little in the third compartments of the zinc boxes. When sodium peroxide was used in the solution the precipitation was imperfect and was diffused even to the last (the eighth) compartment.

The solutions are as clear as rain water. When the tailings were treated with the same strength solution, $\frac{1}{10}\%$ to $\frac{1}{100}\%$ KCN, without the addition of calcium hypochlorite to the charge, the extraction was only 41% of the assay value. I believe that the addition of calcium hypochlorite to tailings, sprinkled over the surface or slacked in dilute solution and the mass poured over the surface, if being worked by the intermediate or direct filling methods, or mixed with the tailings if charged into the leaching vats dry, will yield very satisfactory results. Increasing the extraction and reducing the cost of treatment, as a very dilute solution, will give better results and in a much shorter time than a stronger solution without the use of this agent.

Altar, Sonora, Mexico.

A RECENT issue of Engineering gives some interesting data of steps taken by the Bethlehem Steel Co. to reduce the cost of shoveling coal, ore, etc., and several specialists were engaged to study the problem. It was found that the time taken to insert a shovel into a pile was shorter if it was shoved into the top instead of the bottom of the pile. It also varied with material, taking longer for coke than sand, and, of course, with the man also, a powerful laborer taking twenty-two pounds at each shovelful, while the average was not more than twelve to fourteen pounds. As a result of this investigation, new sets of shovels specially adapted to different kinds of work were used, and, instead of sending a man out in the morning with a shovel, and allowing him to carry it all over the premises and use it indiscriminately on coke or ore, shovels of different sizes and shapes were used for different materials. The result of the study of this problem has been that the work which required the services of 400 men, at \$1.15 per day, is now done by 85 men, who are paid \$1.85 per day.

THE latest from Thomas A. Edison: "I believe that within thirty years nearly all railways will discard steam locomotives and adopt electric motors, and that the electric automobile will displace the horse almost entirely. In the present state of science there are no known facts by which one could predict any commercial future for aerial navigation."

Mining and Metallurgical Patents.

Patents Issued August 19, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

PROCESS OF TREATING ORES.—No. 707,107; J. Herman, Canon City, Colo.

Roasting sulphide of copper ore at low heat to form sulphates of copper and some of iron present, produce a large percentage of ferrous sulphate, leaching roasted ore, precipitating metallic copper, adding salt to leaching solution, before or after precipitation of metallic copper, whereby ferrous salts in solution are converted to chloride and solution having an excess of salt is produced, solution adapted to dissolve copper and silver out of carbonate and oxide ores.

ORE BREAKER.—No. 707,385; A. C. Calkins, Los Angeles, Cal., assignor to F. W. Braun, Los Angeles, Cal.

In an ore crusher, combination with inclosing casing open at one end, having perforated lugs at open end on each side; of removable jaw having corresponding perforated lugs adapted to register with lugs of casing, two pins passing through registering lugs to secure jaw in place, set screws passing through jaw and bearing against casing to take up looseness in joints between jaw and casing; combination with stationary jaw and vibratory jaw having heel at its lower end; adjustable heel block having fulcrum seat for heel of jaw in front and guide lugs in rear, main frame or casing having on each side inwardly projecting lug arranged behind heel block, having screw-threaded hole through it, adjusting screw on each side tapped through lug, bearing against heel block, extending outside of casing and provided with handle.

DRILLING MACHINE.—No. 707,507; F. N. Gardner, Beloit, Wis.

Combination with vertical column, of revolving work-table support, annularly arranged, rotative drill spindles revolving with work-table support, work tables located severally beneath drill spindles,

provided with stems which have sliding, non-rotative engagement with work-table support, concentric, stationary cam ring below work-table support, provided on cylindric surface with upwardly facing cam shoulder, collars surrounding lower ends of stems, laterally directed bearing rollers on collars adapted for engagement with cam shoulder, collars being provided with inwardly projecting parts adapted to enter longitudinal grooves in stems, capable of longitudinal movement on stems to permit vertical adjustment of collars, stops in grooves adapted for engagement with projecting parts of collars to limit vertical adjustment of collars on stems.

METHOD OF BUILDING SUBAQUEOUS FOUNDATIONS.—No. 707,093; J. T. Ford, Cartagena, Colombia.

Method of constructing subaqueous foundations consisting in first sinking shafts on opposite sides of water, safe distance from water's edge down to bed-rock, then tunneling along bedrock from shaft to shaft, cementing tunnel walls to desired thickness, then building tunnel on tunnel until desired height is reached.

HYDRAULIC DREDGER.—No. 707,293; L. W. Bates, Chicago, Ill.

In combination with pontoon, discharge pipe carried thereby; arms or levers C extending outwardly from pontoon; bridge piece extending across between arms; eyebolts extending down from and adjustably secured to bridge piece; shore discharge pipe F; trunnions connected to pipe bearing in eyes of eyebolts; radius bars connected to trunnions pivotally connected at opposite ends to pontoon; flexible section H interposed between discharge pipe on pontoon and shore discharge pipe.

STAMP TAPPET.—No. 707,259; C. C. Rueger, Butte, Mont.

Stamp tappet having bore longitudinally through it, approximately half bore being of such radius as to fit tightly about stem, other opposite portion of bore having larger diameter to form clearance between itself and stem, keyways passing through tappet at two or more points removed from each other upon side contiguous to larger bore, gibs and keys by which smaller part of bore is caused to seat about stamp stem.

ART OF TREATING REBELLIOUS ORES OF THE PRECIOUS METALS.—No. 707,214.—W. F. Downs, Jersey City, N. J.

Process of treating ores containing precious metals and rebellious elements which consists in intimately mixing ore with sodium compound and agent capable of releasing metallic sodium therefrom, heating mixture to temperature sufficient to release sodium, whereby combination of sodium with rebellious elements of ore results and leaves precious metal distributed in free state throughout mass, permitting volatile impurities and compounds to escape and finally recovering precious metal from the mass.

Mining Summary.

Specialty compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

(Special Correspondence).—Ground that was frozen last summer so that no work could be done on it is being worked easily this summer, and everybody is anticipating a result that will be almost double the gold output of last year, namely, at least \$10,000,000.

The vicinity of Nome has proven to be the most valuable one. The "Hot Air" bench on Glacier creek has produced during the twenty days of work up to date \$75,000. C. D. Lane has produced out of No. 2 below on Anvil creek up to date this season \$200,000, and corresponding amounts have been taken out of all the Anvil creek claims. The bench ground on the left limit of Anvil creek has proven to have an old channel, which is being opened up with almost the same results as the creek claims.

On Dexter creek several sales of property have been made to Kelly and the Pioneer M. Co. The Sugar claim has been sold for cash for \$50,000. The Bowery claim, Molasses, several claims on Newton gulch and Dry creek have been sold to the same parties at an aggregate figure of \$250,000. The purchasers have installed boring outfits on the Dexter claims and are prospecting for deep diggings.

The hydraulic ditch of the Miocene M. Co. is doing excellent work on Snow gulch, and a branch leading from Hohson creek is doing good work on No. 7 creek claim on Dexter. The ditch will be finished (about 25 miles in length) in the course of two weeks, when 2000 inches of water will be conveyed from Hohson to Dexter and Glacier creeks. The same company is putting a tunnel through the hill between Glacier and Anvil to use the water on Anvil creek.

C. D. Lane's pumping plant is in operation as far as Cooper's gulch, which property Lane intends to open up first. The pumping plant works like a watch, but the pipes occasionally cause some trouble. However, the defects will be remedied in time.

The Anvil Tundra M. Co. of Los Angeles, Cal., who bought property below Anvil creek, on the left limit, for \$100,000, is boring for prospects, to locate the channel, with good results.

Nome river benches, about one mile above Dexter, have been found to contain a large amount of low pay gravel, and a New York company is putting a ditch from Hohson (the mouth of Hohson, the Miocene Co. gets the water at a large spring at No. 3 above) creek to their claims.

There is another concern, the Gold Run M. Co., putting a ditch at the head of Nome river to work some bars on the left limit.

The Carson M. Co. has purchased some claims at the head of Snake river, also bar claims, which will be worked extensively.

The Solomon district has proven to be quite a surprise. The claims on Kasson creek, Discovery and No. 1 below, have opened up their claims and put a ditch 4 miles long from Shovel creek, and the first clean-up of ten hours they have paid for the mine and ditch. No. 2 above and the rest of the claims have no water. The formation is limestone and the pay is in the crevasses. Mystery creek is a surprise to everybody. Only two weeks ago, on No. 1 above, they have found a body of pay of 3 feet, which goes from 25 cents to 75 cents to the pan. They average about \$40 per shovel per day. The same can be said of Discovery, which was sold by former Collector of Port Ivey to some parties for \$3500, only two weeks ago, before the pay was struck. No. 1 below, which has produced \$10,000 last year, is working twenty men this summer, and the owners expect to take out \$40,000. Big Hurrah creek is working up to No. 6 above with very gratifying results. Mrs. C. D. Lane has opened up a quartz ledge on Big Hurrah, which is free milling and assays as high as \$1000 per ton. She intends to ship the ore to the outside this fall. Solomon river benches have been opened up to some extent; however, they are too deep to work at present. The Miocene M. Co. is surveying for a ditch in that part of the country, and it is bound to do good business. A claim on Murane gulch, tributary to Solomon, was sold a few days ago, it is reported, to the Kimhal M. Co. for \$16,000. The upper Solomon is working to some extent, with better than wage diggings. The Council City district has been known to be good for the last two years. Ophir creek is the banner creek in that country. C. D. Lane has a good many properties there, is putting a railroad from Council to his claims, and

works about 250 men. He brought down 380 pounds of gold about two weeks ago, and again 200 pounds last week.

The York district is being prospected for tin. On Buck creek they have found stream tin in pretty large quantities; however, it is doubtful if it will pay as yet to mine that metal. On the Onokowak river, just the other side of York, some Salt Lake parties are prospecting, digging 50-foot wide trenches, evidently looking for the tin ledge. They are very close-mouthed, and it cannot be learned if the stream tin is found in paying quantities.

The Bluestone district this year is very quiet. There seems to have been last year a boom in those claims, which was not warranted; only a very few claims are working with any results.

The Knugrock district is practically abandoned. Lane left the country in disgust. There does not seem to be any regular pay streak in that country, but only spot. It is said by very reliable men that they may find a pan of \$25 in one spot, but then hunt for two months, sink holes and crosscut the creek and get nothing else. Iron creek, which is also in the Kougrook district, is paying only wages.

The Casa de Pago district is fairly good. The best creek is Ruby creek, which will be nearly worked out after this season. Elkhorn is good and so is Melting.

Candle creek, of which so much was written and said last fall, is in many instances a disappointment. The pay streak is very thin and only at the surface. There are a few claims which will make some money. Sam Pepper is doing well on his six claims at the lower discovery. It is reported that he is taking out about \$1000 per day. Kjelberg, on No. 17 above, is reported making some money.

The latest strike of any size was made a few days ago on Peluk creek, about 2 miles east of Nome. They have found about 1 mile from the beach a deposit of gravel 17 feet in thickness and 600 feet wide, which goes from 10 cents to 75 cents to the pan. The Smook M. Co. claims the ground, and the parties working the claims have been enjoined from further workings.

The Northeast Siberia M. Co. is doing good work across the Straits, it is reported. More than 100 American miners have been grubstaked by that company, and the reports coming from that part of Siberia now are quite encouraging. They claim to have made good discovery about 2 miles from the beach. The country, however, is most inhospitable. Even the drift-wood, with which this side of the Straits was blessed during the first part of the "stampedee," is absent in that country. The company, however, that is operating under a concession of the Czar, is well organized and backed by big capital. Nome, Aug. 13.

Fourteen claims on Nevada creek, near Juneau, are bought by F. M. Stone, representing New York men—the Alaska Treasure, Thousand Fraction, Cora Butler, Champion, Belmont, Copper Stain, Island, Summit, Denver, Bonanza, Blue Bell, Last Chance and Utah lode claims, with water power and beach rights. The Juneau Dispatch says: "The ledge on the surface is fully 1200 feet wide, and it is one of the huge deposits of low-grade ore that has made Douglas Island so famous." Work will start this season on the property. The present showing made warrants the erection of a large stamp mill.

Work has been suspended on the new gold quartz mine operated by the Apollo M. Co. at Squaw Harbor. This ledge was discovered last year and was being developed by shaft and a 5-stamp mill. The money was furnished by L. Sloss & Co. of San Francisco, who operate the Apollo mines, which are yielding large returns in gold hullion.

At Valdez the Rainbow M. & D. Co., G. Barrack general manager, will do considerable preliminary work for a hydraulic plant to be put in operation there. A tunnel will be cut and a tramway huilt from the beach. It is expected that they will have 100 men at work Sept. 1.

At Sea Level, southeastern Alaska, the Sea Level M. & M. Co.'s new mill and other improvements, costing \$61,000, are in operation. The vanners are not sufficient to handle the ore if the mill were run to its full capacity of 125 tons a day. The power drills are too large, as they drill holes of such size that in blasting the ore body, as well as additional rock of no value, is thrown out and has to be treated at the mill. These minor objections will be remedied at once.

Juneau expects that the great tunnel to be run from the beach on Gastineau channel to the Silver Bow basin will begin next month. The tunnel will be 12,000 feet long and will be at least eighteen months in building. The company that will construct the tunnel has contracts with the Alaska-Juneau and Alaska Perseverance companies to carry the ore mined in the basin to the beach, where

the mills are to be located, for 8 cents per ton. Juneau figures that the ore may run \$4 per ton and can be milled for \$1.25 per ton, and that the mines in the Silver Bow basin will be able to run winter and summer as soon as the tunnel is finished, hundreds of miners who are in the habit of returning to the States every fall remaining for steady employment.

ARIZONA.

COCHISE COUNTY.

The Buena Vista mine directors are considering the advisability of erecting a smelter on the Southern Pacific Railroad, 4 miles from the mine, and putting in a railroad or tramway from the smelter to the mine.

The Calumet & Pittsburgh Development Co. at Bisbee will buy the Del Oro and bond the Ormond group of five claims close to the property of the company. The Briggs shaft is now down 410 feet.

The Copper Bullion M. Co. have the tunnel in 900 feet—200 feet yet to run to cut the main vein at a depth of 400 feet.

MARICOPA COUNTY.

At Phoenix the Big Creek G. M. Co. has incorporated; H. L. Hollister, W. M. Lucas, F. C. Rutan and others of Idaho. The Huh M. & M. Co., W. E. Galpin, J. B. Flynn, P. G. Lowenberg of Iowa, and the Norwegian Con. M. Co., E. A. Bridgeford, B. G. White, J. M. Vignia of California, are incorporated at Phoenix.

Manager F. M. Czarnowski of the Leviathan G. M. Co. says it is reported that the building of the proposed railroad west from Congress Junction will soon begin; that the Planet Saturn mine in Fool's gulch, together with a number of adjoining claims, is sold to New York parties for a sum in the neighborhood of \$435,000. The Planet Saturn is a developed property and one shaft is down 1120 feet and all in ore. There is also some drifting on a ledge that shows a pay streak of 4 feet.

The mine is about 5 miles east of Congress Junction, with a 10-stamp mill on the ground. It has not been worked on Planet ore lately, for the reason that a larger plant is necessary to work the property to the best advantage, and the new owners expect to build a 100-stamp mill as soon as possible. Three miles farther, 1 mile from Stanton, is the Trinidad—Genung or Churchill—mine, at one time bonded by the Leviathan Co., but released for the reason that it found plenty to do in the development of its other holdings. The Trinidad is showing up well. It is the intention of the owners to put up an 80-stamp mill, which was decided upon after a thorough test made at the Planet Saturn mill. It was intended to make a mill run of 1000 tons at the Planet Saturn, but after 200 tons had been worked the expert was satisfied without going to further expense. The Octave mine and mill are running full forces and with good results. On the Leviathan property, which Manager Czarnowski is developing, the incline shaft is now down 250 feet.

MOHAVE COUNTY.

O. W. Barnes and A. B. Robbins of the Cyclopic mine, Gold basin, are putting in machinery and will install an automatic cyanide system at the property. The mine is now so far developed that it will keep a good-sized plant in ore.

The Kingman Miner says the strike in the Minnesota-Connor mine is in fine shape. The ore bodies are getting larger as the drifts are being driven. One hundred tons will be tried out at the smelters to ascertain the feasibility of smelting in connection with the concentration plant. If the concentrates have to be handled they will be briquetted and a machine for that purpose will be put in.

The Kingman Miner reports a body of silver ore on the 300-foot level of the C. O. D. mine, 630 feet west from the shaft, of an average value of 680 ounces silver and \$16 gold.

PIMA COUNTY.

Eight miles from Vail a strike is reported in the Cuprite mine in a crosscut from the 150-foot level. The rock carries a percentage of copper, and is said to average \$41 in gold.

PINAL COUNTY.

The Copper Hill M. Co., 3½ miles from Oracle, on the west side of Canada del Oro, are grading for a leaching plant with a daily capacity of 100 tons. On the 200-foot level they have a body of 5% ore 17 feet in width. The ore is carbonates and copper silicates. They are surveying a line from the mines to Red Rock station, on the Southern Pacific Railroad, via Squaw Tanks. The plant will be in operation January 1.

D. F. Platner, manager Home T. S. M. Co., Picacho mining district, has five claims, prevailing values copper. He will arrange for a smelting plant; pending this, development work will be pursued.

YAVAPAI COUNTY.

Near Jerome, at the United Verde, carbonic oxide gas is made and forced where the fire is confined. After it is extinguished work is projected on a larger scale than before. The smelter has six 250-ton furnaces, four of which were kept at work. No. 1 has been torn out to make room for a 500-ton furnace, which is to be followed by another of the same size. This will make necessary additional converters, etc.

The Iron Queen smelter is building at Mayer and the railroad is being extended beyond Mayer toward the Crown King mine. Twelve miles south of Mayer is the French Lily mine, where three shifts are pushing development work. Two miles farther, at the Middleton mine, three eight-horse teams are hauling air compressors, drills and other machinery, to be ready for work January 1, 1903. Leyster Brns. are operating a steam dredger. All the water is piped from the top of a neighboring mountain. The dredger, instead of floating, is placed on wheels. Its capacity is 600 yards per day, but they only have water for 200. The dirt pays from 10 cents to \$3 per yard. The Iron King mine, 8 miles north of Mayer and 1½ mile from the Val Verde smelter, is owned by the American Copper Co., B. Blanchard superintendent. Two shafts are down 117 feet. Two more shafts are down 60 feet each, and on the 100-foot level there is about 1400 feet of drifts and crosscuts. The Bonanza mill on Big Bug creek, near Mayer, is working day and night shifts. About \$9000 was the result of last month's run.

Superintendent Smith of the Jerome Canyon C. Co. has the main shaft down 140 feet. He will put in a pumping plant in Mint valley to pump water over the hill to the mine. Near by the Little Giant Co. is sinking two double-compartment shafts. The ores carry copper, silver and gold.

The Jerome Mining News interviewed W. A. Clark and quotes him as follows: "The mine and works will be started up, depending on the time it takes to put out the fire in the mine. The fire is burning from the 500 to the 150 foot level and from 200 to 300 feet in depth. It has been hulk-headed in and they are forcing gas upon it from two generators. To completely extinguish the fire, it will be necessary to entirely cover it with this gas. After doing this work the gas will be taken from the mine through the 500 foot tunnel, when work can be again carried on. The condition of the copper market is such that they are in no hurry about starting up at present. There was an increased production of 25,000,000 pounds for the first six months of 1902 over the last six months of 1901. This immense production of copper will naturally create a surplus, and this surplus would force the red metal down to 10 cents, and there are but one or two mines that can afford to produce copper at 10 cents per pound, and Montana does not contain one of these."

The office of the Val Verde Copper Co. has been removed from New York to Prescott. F. M. Murphy has taken the presidency of the company. Board of Directors: F. M. Murphy, M. Goldwater, T. B. Hawkins, C. G. Fennell, J. L. Davis, S. E. Bretherton and W. F. Taylor.

YUMA COUNTY.

The Planet group of copper mines are sold to Boston men.

CALIFORNIA.

ALPINE COUNTY.

The Curtz-Evans mill on the Carson river at Loope is to have an aerial tramway from the mine to the mill. The dam and flume are finished and ready for the turbine wheel to furnish power. The mill will crush 100 tons daily.

AMADOR COUNTY.

At North Clinton the Edinburg G. M. Co. are sinking a double-compartment shaft to the 300 level. Assays from clear across the ledge in the last crosscut gave \$14.81 free gold, 88 cents in silver, with 3.6% sulphurets, value \$54 per ton.

At the Defender Manager Joyce is putting up a new hoist and 10-stamp mill.

In the Del Monte mine the tunnel has tapped the Riverside ledge; the ore body is 26 inches wide. The water supply having failed, hand drilling is resumed.

The ledge has been found in the 850-foot level of the Fremont shaft and the rock is reported as good as it was on the level above.

CALAVERAS COUNTY.

At the Golden Eagle quartz mine at Siheria, near Jenny Lind, Supt. G. B. Tolman has the grading completed for a new plant. The shaft connects with the old workings of the mine.

At the Altaville mine, near Angels, cross-cutting and drifting from the 400 level is in progress.

At the Melones mine four cars are used

to haul the ore 1 mile to the ore bin and rock breakers. Sixty stamps are in operation.

D. A. and W. M. Nuner have bonded their mine on Central hill to Oakland men for \$60,000, first payment to be made in October.

FRESNO COUNTY.

A quartz mining property, about 1½ mile west of Dunlap, has been bonded by J. McKiernan of San Francisco for \$50,000, the option good for one year. In the meantime the lessee is to pay \$20 per day for each 3-stamp mill he operates; he intends to put up one and a Huntington mill of 1½-stamp capacity, hence will pay the owners \$30 per day.

INYO COUNTY.

O. H. Hill and M. C. Hall have a molybdenum claim at South Bishop lake; the ledge, 100 feet wide, is estimated to carry 40%.

W. C. Pidge has fourteen men at work on the Leidy-Vanfleet mines, near Bishop. The Yaney-Enloe mines are being worked by C. T. Hohensthal.

KERN COUNTY.

Talking of the Yellow Aster, the Randsburg Miner says the temporary bucket is now in at the Goler wells and the 100-stamp mill is running. When the shaft is retimbered, connection of the new well with the old one, a distance of 270 feet, by a tunnel run below the water level, will be done.

LASSEN COUNTY.

The Lassen M. Co. has incorporated; A. M. Hunt, M. Meredith, E. H. Benjamin, L. Sloss, L. Sloss, Jr.

MARIPOSA COUNTY.

At the Hite mine the compressor is in operation unwatering the shaft. H. J. Sisty, the superintendent, is in San Francisco.—A shaft is being sunk at the Early mine, on Sweetwater. The new company expects to put in machinery.

Nevils & Hanna are operating the Dolph mine at Whitlock.

NEVADA COUNTY.

The South Yuba M. & D. Co. has incorporated; the mine is located near Maybert; C. I. Swift, H. A. Niemeyer, M. S. Blanchard, J. A. Jeffrey, C. W. Porterfield.

C. H. Brockington, superintendent Orleans Con. mines, is running a crosscut to strike the Houston Hill ledge at 500 feet and has struck it. The 700-foot level of the Houston Hill has been reached; the upraise is being pushed forward; the crosscut opens up virgin ground which will have 200 feet of backs when blocked out.

At Grass Valley the plant at the Conlin mine, which was destroyed by fire last week, will be replaced.

G. W. Root has formed an Eastern company that has bonded the Charranot mine at Canada Hill and the Slate Ledge mine below Grass Valley.

W. F. Englebright and F. Zeitler are at Bear Valley, where they have a promising mining property.

Work has been resumed in the old St. Louis mine on Canada Hill.

At the Independence mine above Nevada City more men are to be put on.

PLACER COUNTY.

Near Forest Hill J. Beach has a 6-foot ledge which assays unusually high in gold.

PLUMAS COUNTY.

The Elizabeth G. M. Co. has incorporated; C. R. Thompson, L. T. Jacks, J. M. and W. D. Duke, and F. P. Howard.

The Quincy M. & W. Co. has cleaned up and is now arranging for next season's run. The Little Hope quartz claim, near Merrimac, is reported sold to parties who will operate on a large scale. The Lost Channel M. Co. has resumed work on the property near Cromberg.

W. L. Harper and G. Cooksey will erect a smelter at Taylorsville for Genesee valley ores.

SAN BERNARDINO COUNTY.

In the future Manvel, Cal., will be known as Barnwell.

SAN DIEGO COUNTY.

F. N. Ramsey, a mining man from Texas, has a concession from the Mexican Government to mine for gold ore on the largest of the Coronado islands, and to prospect the other islands for three months.

SHASTA COUNTY.

Local reports are to the effect that the Tarbet syndicate owns the Afterthought copper and gold mine, having paid about \$100,000, and that of the amount paid for the property Mr. Enright gets \$80,000 and the heirs \$20,000. The property comprises eighty acres.

The Sam Houston M. Co. has levied an assessment of 2 cents per share, delinquent September 27.

The Redding Free Press says that Saeltzer, Kahny, Jaegel and Arps have

given to F. H. Hall, who has the Arps group bonded for \$80,000, an extension of six months from December 10, 1902, the date of expiration. Mr. Hall, in view of the concession, makes a payment of \$5000.

Copley reports a strike in the lower tunnel of the Great Western G. Co.'s mine, 300 feet in. The shoot is 100 feet long and shows free gold its full length.

SISKIYOU COUNTY.

M. M. Hough has sold to R. Phillips several mining claims and ditches at Scott river, the Quartz Hill, Ryan and California mines, including the ditch from Mill creek to Hooper hill, the ditch to Poorman's Bar; also the Ryan, Tom Smith, Ed Reynolds, Jeffer, or new ditch, and the Hicks ditch, together with all the giants, pipes and other apparatus for \$100,000. This property will be worked on a more extensive scale.

J. P. Wood has sued J. A. Thompson for an eighth interest in the King Solomon's mines, which are owned by the defendant and valued at \$35,000. Wood alleges that Thompson made an agreement to transfer that interest to him.

TEHAMA COUNTY.

J. J. Grossman says that Cottonwood creek is to be worked by dredgers. His company has 9 miles of the bed of Cottonwood creek from 2 miles south of Cottonwood to 7 miles north. A drill costing \$3000 will prospect to bedrock, and if the ground is rich enough a gold dredger will be erected.

TRINITY COUNTY.

N. Thomas has made a strike on Packer's gulch, 6 miles from the Nash mine, 10 inches of ore assaying \$100 and 3 feet which goes \$25.

The Gold Hill M. Co. of Canton, Ohio, is opening up an ore body 10 miles east of Trinity Center.

The Cleary, Payne & Keenan Co. have put in a dredger on Trinity river, half a mile above Trinity Center.

The Oro Fino mine, owned by Strode Bros., near Carrville, is being operated. The mine is paying handsomely. G. Strode has charge of the mine, J. Strode superintends the 5-stamp mill.

At Trinity Center the Sikes M. Co., operating the Bloss & McClary hydraulic mine, have closed down and are preparing for the coming season.

At the Fairview mine eighty men are now employed.

TUOLUMNE COUNTY.

Near Groveland, the vertical shaft on the Cosmopolite is down 120 feet; sinking is in progress.

H. J. Dykes has a bond on the Oakland and Auburn mines above Yankee Hill. A 5-stamp mill will be overhauled and a new concentrator put in. A hoist will be erected and sinking continued.

The Imperial M. Co. has levied an assessment of .6 of a cent per share, delinquent September 29.

The old Buchanan may start up again. The Spring Gulch mine has resumed. The Western Venture M. Co. have it now. New machinery is being put on the Hard-tack.

The Spring Gulch mine shaft is to be retimbered 500 feet and sunk farther.

The cyanide plant of the Confidence M. Co. at Confidence is daily treating 100 tons of tailings.

The mill at the Golden West mine is in operation; F. Miller superintendent.

YUBA COUNTY.

The Marysville Democrat says there is little if any hydraulic mining on the watershed of the Yuba river at present, as the water in that stream is almost as clear as that in the city tank.

The Pennsylvania mill was started on the 22nd and the stamps are crushing ore from the 700-foot level.

The U. S. has paid \$875, one-half the amount of the purchase price of the land of Burns and Townsend, at the site of the proposed barriers at Daguerre Point. The only deeds now remaining to be paid are those of the Excelsior W. & M. Co. and the Marysville T. & Q. M. Co.

At the Miller quartz mine at New York Flat, 4 miles from Brownsville, a steam rock crusher is at work. This mine has a 10-stamp mill and is producing quite satisfactorily. The property is owned by Minneapolis men.

COLORADO.

ARAPAHOE COUNTY.

The New River Copper Co. of New York has been incorporated at Denver, authorized to carry on mining and milling of ores and metals.

BOULDER COUNTY.

A company has been organized to operate the Ramsey, the Kittie and the Eclipse groups of mines at Eldora. It is proposed for the economical mining of these ores to drive a tunnel 6000 feet long from 75 feet above Boulder creek in Main Boulder canyon, cutting the veins on each of the

company's claims and on all claims under royalty at a depth of from 600 to 900 feet, furnish drainage and avoid the necessity of hoisting ores from deep mines and transporting them by wagon over rough mountain roads.

CLEAR CREEK COUNTY.

The shaft on the Black Eagle is 560 feet deep. The company operating the mine have the entire Parker placer, including the Chicago mine, and the shaft is located near a junction with that lead. At the present time ore is being taken from the fifth level, although stopes have been started in all the levels. At the junction the vein is 16 feet wide, and the entire vein is bailed and treated at the company's cyanide mill on Chicago creek. Mr. Ames, the manager, tells the Idaho Springs Gazette that he does not sort any of the high-grade ore for the smelters, as he can treat it himself at the mill and make a saving over the smelting charges. The concentrates, however, are still shipped to the smelter as heretofore. They will run one to one and one-half ounce gold, seventy to eighty ounces silver, 12% lead, 8% zinc and 20% to 30% silica. The ore concentrates about twenty into one. He says the average percentage of saving with his cyanide process is between 85% and 90%.

Near Empire, on the Conqueror group, Silver mountain, an ore body 9 feet in width was opened up on the Conqueror vein.

The Empire tunnel is in 1220 feet and advancing at a rate of 5 feet per day, being driven with two power drills.

A strike is reported on the Milford lease on the Salisbury mine of the Stanley Consolidated at Idaho Springs.

The frequent occurrence of quartz feeders, thickly interspersed with copper and iron pyrites, and the exceeding hardness of the rock is regarded by the management of the Empire Tunnel Co. as evidence of the proximity of another vein. The bore has passed the 1200-foot mark.

CUSTER COUNTY.

The Bassick mine will enlarge its mill from a capacity of seventy-five tons per day to 100 tons. Rollers and crushers go in at the new deep shaft, where the ore is delivered and crushed and is then conveyed in sluice boxes to the mill, 500 miles distant, this method of transmitting ore being thus used for the first time in that part of the State.

The new 10-stamp mill at the North Star mine, 9 miles from Custer, is in operation. The North Star Co. says there are ten stamps with room for twenty and power enough to run forty.

DOLORES COUNTY.

Manager Rider of the United Rico Mines Co., at Rico, is having the Atlantic Cable mill placed in condition to operate.

FREMONT COUNTY.

At Florence the Hillside Reduction Co., to operate in Fremont and Custer counties, has been formed; object, to reduce gold and silver ore, buy and sell metal bullion.

GILPIN COUNTY.

During the second week of August the shipments of smelting and crude ores, tailings and concentrates from the Black Hawk depot to the Valley smelters and outside points of treatment were 107 cars, or 2040 tons, making a total of 217 cars, or 4240 tons, for the first half of August.

GUNNISON COUNTY.

The Akron tunnel, White Pine district, is working three shifts. Superintendent Harper has the 3300-foot bore well into the hill and expects to get into the mineral zone of the May-Mazeppa and North Star properties.

J. A. Mann, superintendent of the Horton G. M. Co., is working the property above Tomichi. They have ore that runs \$64 in gold and copper.

HINSDALE COUNTY.

At Sherman, 3 miles east of the entrance to Burrows park, the large dam blocking the waters of the Lake Fork river will be completed next month. The Tabasco's power transmission line along and through which the power will be carried to the mill and the mine is 7 miles and 9 miles from the power house. The mill is being built on the company's millsite at the head of Burrows park, and where the Hinsdale-San Juan road begins its real ascent is over the divide between the Lake Fork and Animas rivers. The process will be concentration and cyanide, capacity 150 tons daily. Between the mill and the mine the Leschen Co. of St. Louis is stringing the tramway. O. W. Pierce is resident manager.

IRON COUNTY.

Manager Frew of the Iron Mountain Copper Co. says work will be resumed, the shaft sunk to the 400-foot level and other developments started.

LAKE COUNTY.

At Twin Lakes the Golden Gate and Golden Bay claims will be worked by J. J. Smith of Leadville.

At Leadville the water has been lowered in the El Paso shaft to within 65 feet of the bottom. Manager Newell thinks that by Oct. 1 the property will be all unwatered and shipping ore.

Another shaft is being sunk on the Cora Bancock ground, and this will be down as deep as the El Paso shaft by Oct. 1. A set of pumps will also be put into this shaft, and it and the El Paso Maid will be the company's main shafts, the intention being to sink them both together as soon as the water is taken out, and continue sinking until the second contact is reached.

Wm. Bowden has bought the Ruby Leasing Co.'s ground and will tunnel 400 feet to connect with the Yak tunnel.

Leadville reports that after having installed a large plant, and being in a position to handle 500 tons of ore per day, the Greenback mine has turned off steam, shut down its pumps, and will close the mine indefinitely, caused by the inability of the management to make a contract with the American Smelting & Refining Co. The mine employed thirty men. The ore is a sulphide, and like all sulphide bodies there are high and low grades. Manager Mulrooney states that the smelter has been taking the high grade material and charging the highest rate the traffic would bear. The company desired a contract under which they could ship the material, the same as other mines in the camp, but were unable to obtain it. This led to the closing of the property.

There is a resumption of work on the Rialto property, in the hands of the Small Hopes M. Co., in charge of S. W. Mudd.

PITKIN COUNTY.

At Aspen, F. Meyer, W. P. Nelson and E. Stallard have incorporated the North Pole M. Co.

PUEBLO COUNTY.

At Pueblo the new zinc smelter in the eastern part of the city will be completed January 1. The plant will be a large one and will employ 500 men when in working order.

SAN JUAN COUNTY.

At Eureka the Tom Moore Con. M. Co. has a body of copper sulphide ore in the No. 1 tunnel, 1600 feet from the mouth. The Tom Moore has been a large shipper from the surface workings to the smelter at Silverton, 9 miles away.

Silverton reports in the Gold King mine, since the new strike of gold in the American tunnel, that an occasional special run is made over the Cement creek branch of railroad with guarded car. W. Z. Kinney, superintendent Gold King Con. M. Co., says his company intends to construct buildings adjoining its properties near Gladstone for miners and families.

Bear Creek's experimental mill for the treatment of tellurium ores has treated ore from two of the larger properties.

The Kendrick-Gelder smelter is handling about the same quantity of crude ore and concentrates shipped to outside smelters as last year at this time.

The Esmeralda mine, near Silverton, is daily producing four D. & R. G. cars of \$40 ore.

SAN MIGUEL COUNTY.

The Mayflower G. M. Co. is incorporated at Telluride; E. L. Davis, W. A. Nicodemus of Telluride, John Eckman of Calumet, Mich.; principal office at Telluride.

Telluride reports that the H. M. H. group of claims, consisting of three patented mining claims, the H. M. H. No. 1, H. M. H. No. 2 and the Jennie lode, located in Bear Creek basin, are sold to John Akman, representing Calumet, Mich., people, for \$25,000. The new company is the Calumet-Telluride G. M. Co., Calumet, Mich. The ore is carbonate, strictly a concentration proposition, and the values are gold. The veins range in width from 3 feet to 5 feet and the average value is about \$10 gold per ton. The company has bought the Glencoe mill on Bear creek, below the properties, and will construct a tramway 3400 feet in length to connect the mine and mill next spring. The equipment of the mill will be greatly enlarged. There is plenty of water for batteries and concentrators for a large mill.

Telluride reports that the owners of the Silver Pick group of mines, including the Silver Pick mill and two placer claims, have mortgaged their possessions for \$100,000, presumably to inaugurate operations on the property. The properties are on Mount Wilson, a shipping station on the Rio Grande Southern Railroad.

Seventy pounds of gold ore—\$1800—is asserted to be the result of a cleanup of some ore out of the Governor mine, near Telluride, recently.

The Mayflower G. M. Co. has incorporated. J. Eckman, general manager, is to

handle the Mayflower group, Grey's basin, a fork of the Bridal Veil, 5 miles south-east of Telluride.

TELLER COUNTY.

On the 19th 140 tons of good grade ore went out from the Isabella company's territory on Bull hill. Of this amount 75 tons were shipped by the company and 65 tons by lessees. The ore will average from \$30 to \$50 in gold to the ton.

The Golden Cycle Co. has in the sixth level cut the La Belle vein at a point 100 feet beyond the Revenue Cutter vein, showing between 3 and 4 feet of good ore.

Cripple Creek mine managers who have orders placed for machinery are pleased over the reduction in freights from Chicago and seaboard points, as it will save them thousands of dollars in freight charges. Heretofore the freight charges on machinery from seaboard points to Colorado Springs has been \$1.10 per 100 pounds. The reduction cuts it down to 66 cents. From Chicago points it has been 80 cents per 100 pounds, and that has been cut to 49 cents.

Cripple Creek reports a strike at the El Paso Gold King mine, Poverty gulch. A 12-foot ore body is opened at the bottom of a winze which is being sunk in the 800-foot level. A shot was put in to what appeared to be a hanging wall and when the smoke cleared away some of the finest gold ore ever seen in the district was found. Assays taken across the entire face of the vein average \$40 per ton.

The United Gold Mines Co. is making the third largest production in the Cripple Creek district, the Portland first with 300 tons, the Stratton's Independence second with 250 tons, and the United Gold mines with 135 tons of high-grade ore a day.

IDAHO.

ADA COUNTY.

Control of the Gold Eagle group, Boise, has been acquired by Dorn & Alris of the Con. Mercur, Utah. With four stamps the mine has since January pounded out gold to the value of \$25,000. J. T. Donohue, former superintendent of the Mammoth Co.'s mines at Tintic, will remain with the Gold Eagle in similar capacity. He is extending the drifts in each direction on the 200-foot level in ore, dropping on down to the 300 with the shaft.

BLAINE COUNTY.

E. E. Rogers, of the Gold Creek Con. M. Co. of New Jersey, has returned to Portland, Or., from Pierce City, Idaho. Mr. Rogers was recently appointed a delegate to the mining congress, which convenes at Butte on September 1. Mr. Rogers will represent Idaho at the congress and received his appointment from Governor Hunt.

"I have just completed the arrangements for the machinery for the Blaine group of claims on Moscow mountain for the Gold Creek Co.," said Mr. Rogers recently. "I bought \$2000 worth of equipment in Spokane and will have it installed immediately. It is a cyaniding proposition. We will have the tanks and an entire reducing plant on the ground and will put a large force of men at work. The mine was bought a few years ago from D. Russel Morris, a mining man of Butte, Mont. We now have a double compartment shaft down 42 feet. Our vein is low grade, but is 30 feet wide, and we have all kinds of ore in sight. The mill we expect to put in will drop twenty stamps. I bought the Five Point group of claims at Hailey, the property formerly owned by J. Fleming, for \$30,000 and a silver, lead, gold and copper proposition which will require a smelter." He will arrange for a \$60,000 plant. An electric plant will be installed at a cost of \$12,000.

IDAHO COUNTY.

(Special Correspondence).—The Fall Creek Placer M. Co. has 220 acres of placer gravel ground that will average 43 cents per yard. The company has just commenced working and will make a clean-up this fall. The ground is 15 miles from the old Florence placer diggings, which was worked in the early days. There are several successful placer mines being worked in the surrounding country. It looks as if placer mining by dredger process is going ahead. There are thousands of acres of gravel land that can be worked with profit, if capital will investigate and go at it on right lines.

Florence, Aug. 25.

LEMHI COUNTY.

The Lemhi Herald, of the nickel deposits there, says the large veins of nickel-bearing ores found in the Blackbird and Yellow Jacket districts are attracting attention. Commencing with the outcrop of basic rocks in Yellow Jacket creek, the nickel-bearing zone, coextensive with the granite formation, includes Musgrove, Copper, Blackbird, Clear, Big Deer, Little Deer and Beaver creeks. In Yellow Jacket the ore also carries gold, silver, copper, iron, cobalt and bismuth. In

Blackbird the nickel is found combined with iron or copper in a sulphide.

OWYHEE COUNTY.

R. H. Britt, general manager Poorman mine, Silver City, says rich finds are being made in the old workings. The Poorman's recent rich strikes, he says, are not overestimated.

SHOSHONE COUNTY.

At Burke the Trade Dollar tunnel is being run as a crosscut to tap the ledge. The officials say the ledge will be reached Jan. 1.

At Wardner the ore of the Bunker Hill & Sullivan mine will be taken through the long tunnel to the mill, instead of taking it up over the hill by the aerial tramway. The output of the mine will be increased, more men added and more machinery set in operation. The new tunnel from the mill, west of Kellogg, to the mine at Wardner, is in 12,000 feet. Electric cars have been installed, and, as fast as the ore and rock are taken out, they are taken to the mouth of the tunnel by motor power. The improvements have cost over \$50,000. At present about 1200 tons are taken from the mine per day, but, when the new system is in working order, that output will be increased.

MONTANA.

BEAVERHEAD COUNTY.

P. I. Smith of the Crystal Graphite Co., Axe canyon, Dillon, says development work has suspended for the season, having reached a point where it will be necessary to put in a mill. Unlike ordinary concentrates, the graphite floats off over the water and must be saved by means of washing over a fine screen.

DEER LODGE COUNTY.

A. Schröller and V. Page say they have a 7-foot vein of gold ore on the Lucky Boy claim, near Danielsville. The Lucky Boy adjoins the property of the Dorothy Co. on the west.

FERGUS COUNTY.

Quartz property in the new cyanide district, at the head of Sage and Willow creeks, is being developed. C. M. Goodell says the ore is similar to the Kendall ore; the best is found in the vicinity of the big lime reefs which traverse the country for several miles; the surface covering is either sand, rock or shale.

In North Moccasin the King-Barnes Co. is crushing 225 tons of ore per day and is planning for the enlargement of its mill.

At Kendall the 350-ton cyanide mill of the Kendall Co. is in operation. Superintendent Lang has the new shaft down 280 feet.

FLATHEAD COUNTY.

(Special Correspondence).—An electric drill is in operation on the property of the American Kootenai M. & M. Co., the first electric drill plant installed in Flathead county. The company, with its water power, gravity tram and electric light and drill plant, is in a position to mine and mill cheaply.

The Great Mother Lode property is being developed, and a 65-foot tunnel, which has just been driven, opens up a ledge of free gold ore.

Sufficient ore is blocked out to keep a 40-stamp mill running, and it is proposed to erect the mill this season.

Cabinet, Aug. 24.

A strike of rich ore in the Mollie Gibson mine, owned by the Mollie Gibson M. Co., is reported—galena, pyrites and peacock copper.

GRANITE COUNTY.

The Good Hope M. Co. contemplates erection of a steam hoist on the Silver Chief claim at Tower, and will sink a shaft to explore the contact.

The Dorothy of Montana M. Co. is incorporated. Its mines are near Granite. D. M. Durfee of Phillipsburg is the company's Montana agent.

LEWIS AND CLARKE COUNTY.

Mason, Meade & Harschberger, constructing the 60-stamp mill on the Big Indian mine, in the gold belt south of Helena, have incorporated under the name of the Big Indian M. Co.

Thomas Cruse has unwatered the Kennedy mine and sinking the shaft from the present depth of 200 feet to the 300-foot level has begun, on Jackson creek, 8 miles southeast of Helena. Eight inches of ore is shown in the bottom of the shaft.

The Piegan mine, near Gloster, above Marysville, is being unwatered preparatory to resumption of work.

MADISON COUNTY.

The Bismarck & Nugget Gulch Con. M. Co. is pushing work at the Toledo properties near Sheridan, and will put in a pumping plant at the new shaft. The mill at Nugget is steadily running; Superintendent Ring.

MISSOULA COUNTY.

At the Monitor mine, on the line of Montana and Idaho, thirty men are at work. They are developing the ground

in the interest of Minnesota men, who have the property under a bond of \$150,000. The shaft has reached a depth of 200 feet.

Five stamps of the mill of the Oro-Monarch M. Co., operating near DeBorgia, are unattached on ore from the company's mines, and the other five will be in place in a short time. The ore is low grade. If the 10-stamp mill saves the gold the mill will be enlarged. Assays of picked rock have given returns as high as \$125 per ton, but the average value of the ore is about \$10.

SILVER BOW COUNTY.

At Butte, on the 22d, the reverberatory building of the Butte Reduction Works, owned by Senator William A. Clark, was totally destroyed by fire. Loss \$30,000, insurance \$15,000. The loss will necessitate temporary closing of the smelter and of the mines which supplied it with ore.

NEVADA.

ELKO COUNTY.

A mass of 1700 tons of \$5 ore is said to have been broken down by a single blast in the Dexter mine at Tuscarora recently by piling a large amount of giant powder in a narrow drift run for that purpose. The Tribune hears that the sale of the Dexter Co.'s mines and mills is being again promoted.

ESMERALDA COUNTY.

J. G. Court, discoverer of the New Klondike mines, says the property is under bond to a Philadelphia company, which has men at work developing.

EUREKA COUNTY.

Ore shipments by rail from the mines of Eureka and Hamilton district for the week ending August 22 were as follows: Eureka Co., 26,260 pounds; Rocco-Homestake, 51,200 pounds.

The Hamburg mine, southeast of the Diamond and Excelsior mines on Prospect mountain, Eureka district, has been leased for two years by Stinson & Co.

HUMBOLDT COUNTY.

The Sunlight M. & S. Co. has been organized to operate in the northern part of the county.

The Sunlight M. & S. Co. is incorporated at Winnemucca.

LINCOLN COUNTY.

The Hillside and Bristol mining companies, operating in the Pioche section, jointly own a 200-ton smelter. The plant, it is said, will be run by a management separate from the companies owning it, as in addition to treating ores from the Bristol and Hillside mines, it will do custom work.

T. M. Bard and W. Caltes are developing their property in Kingston mountain, an iron dike 150 feet wide, which runs 75% iron and \$12 gold. The property is 25 miles southwest from Sandy.

The Green Monster will resume work September 1st at Yellow Pine. This mine is owned by the Hearst estate and managed by F. P. Wilkinson. A double compartment shaft will be sunk.

NYE COUNTY.

Besides Weepah another camp has been struck in the Tonopah region. It is 20 miles southeast and is known as Henapaw. The ledge is good sized and carries values in silver as high as 500 ounces.

The Pactolus group of mining claims, near Tonopah, are reported bonded for \$125,000.

At Tybo, the Tybo M. & R. Co. has twenty-five men doing development work on its property.

The Mountain Tonopah M. Co. has incorporated at Salt Lake, Utah; C. E. Knox, president, A. C. Ellis, Jr., vice-president, and A. G. Cushman, secretary and treasurer. The property of the company consists of eleven claims, 160 acres, on the north and adjoining the north side line of the Mizpah ledge. The company has purchased the equipments employed on the O'Meara Lynch lease and will rush development work.

T. L. Oddie and F. J. Slebert of Tonopah have bought the Yankee Blade group, 4 miles from Austin, and will put hoisting and pumping machinery on and begin systematic development.

STOREY COUNTY.

The drill boring down into the east wall of the Comstock lode from the surface, to prospect for an ore body about the 900-foot level, is making rapid progress, the new hole being down about 300 feet without fitching. At the depth of 190 feet the casing was inserted and the hole reduced from 7 to 6 inches in diameter. Electric power is brought to bear in the work, three shifts of men employed, and 100 feet per week is expected to be accomplished.

In connection with an article on page 115, it is expected that the Reider electric pump will get into operation on the 2150 level of the C. & C. shaft of the Con. Virginia M. Co. about Oct. 14, to pump the

water down to the 2500 level or bottom of the shaft. The electric hoist of the shaft is already in position, as described and illustrated, and will then be started into full operation.

At Virginia, drill hole No. 2, on the Brunswick lode, is down 340 feet, and still in porphyry.

The Savage mine reports from the Gould & Curry tunnel, 425 level: In the up-ramp from the north drift from No. 2 east crosscut, we have been occupied during the week in opening one set to the east and two sets to the south, on the tenth floor. Saved fourteen cars of low-grade ore, which has been sent to the Best & Belcher mill. The car sample of this ore averaged \$8 per ton.

WASHOE COUNTY.

C. B. Bell has a working bond on the Crown Point mine, Olinghouse canyon, to leave all ore on the dump, unless he pays \$5000 in six months, final payment of \$5000 in nine months.

WHITE PINE COUNTY.

In the Chalmers, at Ely, in the ores furnished the mill an average for the mine of \$3 a ton is estimated.

C. Wah has shipped to Salt Lake a lot of ore from Cherry Creek that carries 7.18 ounces gold, 7.5 ounces silver, 3% lead and an iron excess of 30%.

NEW MEXICO.

BERNALILLO COUNTY.

T. Curran of the Jura-Trias Copper Co. is at the mines of the company at Senorito to take preliminary measures looking to the installation of a 100 ton plant. The 25-ton smelter installed last year has proven inadequate. The company is locally credited with intention to spend \$1,000,000.

DONA ANA COUNTY.

The Organ Gold Co. say they have thirty claims, in every one of which the ore shows gold, silver and copper in paying quantities, and that they will do considerable work and need machinery.

LINCOLN COUNTY.

J. M. Rice, manager of Eagle M. & I. Co. at Nogal, says he has completed the purchase of the Old Abe mine at White Oaks for his company.

SANTA FE COUNTY.

The Lazarus G. M. Co., thirteen mining claims, with all the personal property, will be sold by W. Swyers, receiver, to satisfy the liens, which aggregate about \$5000.

SIERRA COUNTY.

In the mining camps of the Black Range properties that have been idle for years are resuming work. Hoisting machinery is being freighted from Magdalena to the Armour property, 2 miles below the New Era mine. B. S. Phillip, superintendent of the Silver Monument mine, is considering a site for a mill. The Black Range G. M. Co. wants control of the Wing mill and to move it to work the ores of the Minnehaha mine.

OREGON.

BAKER COUNTY.

W. H. Tibbals and other Salt Lake people have bought the Victor group, six claims, Red Boy district. A cash payment of \$3000 is reported to be 10% of the purchase price.

The Pomeroy dredger is lying in a scooped-out lake or basin on Burnt river, near Weatherby, in charge of G. Moore. The boat is 107 feet long, 40 feet wide. Forty buckets on an endless chain scoop up the gravel to the bedrock, dumping it into a steel flume 160 feet long. The steam power of the dredger operates an electric lighting plant. The work has been prosecuted in from 24 to 32 feet of water. Near Weatherby a strike is reported made in the Granite Mountain claims, M. N. Thompson superintendent.

Superintendent Knight is in charge of an adjoining promising property. The Dana (Superintendent Gleason) and the Weatherby-Bonanza each have 5-stamp mills operated by gasoline engines.

Near Durkee the Gold Ridge and the Gold Hill mines each have 10-stamp mills.

The Mammoth mine, Baker City district, has been sold to Michigan men for \$35,000; first payment of \$10,000 made on the 20th. It is located east of the Virtue mine and has been worked for some time with good results.

Sumpter reports that F. W. Bradley of the Bunker Hill & Sullivan mine has been making an examination of the Ibox mine. The concentrating plant on the Badger mine, owned by him, is treating seventy tons of ore a day, concentrating about 20 to 1. There is no tendency to sliming; the saving is satisfactory.

GRANT COUNTY.

W. Beddlg, who gathers rare ores for shipment to Germany for treatment, was at Nampa last week after examination of

the Standard mine and its body of cobalt ore. He will remain at Quartzburg.

JOSEPHINE COUNTY.

The Golden Drift M. Co. expects to have its dam near Grants Pass completed this season. Rogue river at the point where the dam is constructed is 240 feet wide, average depth 6½ feet. The entire length of the dam will be 650 feet. At the bottom the dam is 100 feet wide. A 50-foot apron will be laid up stream, giving a 160-foot surface on the bottom, strengthened by two rows of piling tipped with steel to permit of them being driven into the cement bed of the river. The timbers used are 12x12 inches. The height of the dam is 20 feet and the race is 90 feet wide, 25 feet deep. The hoists will admit ten water wheels, giving 8000 H. P. There will be one pump lifting a 24-inch stream and delivering 22,000 gallons of water per minute. This pump weighs 43,000 pounds. Four other pumps will be installed at first, capable of lifting 9000 gallons each against an 800-foot head.

MALHEUR COUNTY.

A ledge of gold-bearing ore has been discovered on the Lower Willow creek, 20 miles from Huntington. S. J. Russell of Boise, Idaho, is the first locator, but adjoining prospects are also located, there being thirty men there.

UNION COUNTY.

Two rich strikes have been made at Cornucopia, one at the Beer mine, another in a mine owned by J. Mackie.

T. Crawford says the Pomroy dredger, in operation on the John Day river, is a success.

SOUTH DAKOTA.

CUSTER COUNTY.

Deadwood reports a mill test on tin-bearing ore, at the Clara Bell mine, which showed the ore carries about 4% tin.

LAWRENCE COUNTY.

At Cyanide the Gold Edge Co. is sinking a shaft on the north of the Spearfish Co.'s property and are down 300 feet.

The Golden Crest M. Co., owners of the former Chris. Webber property, has decided to construct a cyanide mill.

PENNINGTON COUNTY.

At Hill City, the Gertie Tin Co. has installed an air compressor to sink a 400-foot shaft an additional 100 feet, to demonstrate what may be expected by deep mining for tin in the Black Hills. At the 400-foot level in the Gertie mine, tin ore averaging 5% has been mined and milled, the ore vein being 4 feet in thickness. Development on the Gertie is being pushed by E. C. Johnson.

TEXAS.

JEFFERSON COUNTY.

A large zinc smelter is to be founded in the southern portion of Beaumont.

UTAH.

BEAVER COUNTY.

(Special Correspondence.)—The Copper Ranch M. Co., Rocky Mining district, with headquarters in Salt Lake City, own seventeen claims with 2 miles along the course of the vein, lying midway between the Old Hickory and Montreal mines on the east and the O. K. mine on the west. This company has done about 1100 feet of development work on its claims. It places the vein is 100 feet wide and will carry copper at from 5% upward. At the Jewel mound on the west end of the property, near the O. K. mine, the shaft has reached a depth of 125 feet, showing a body of sulphide ore that will range from 12% to 15% copper, besides carrying some silver and gold, and as high as 64% iron. How wide the vein is at this point can not be stated, but 80 feet above the vein is known to be 105 feet wide between the granite foot wall and porphyry hanging wall. This company will buy a steam hoist, compressor and drills and sink the shaft from 600 to 1000 feet deep. B. T. Lloyd is manager.

The Copper Mountain M. & M. Co., Beaver Lake mining district, with offices in D. F. Walker Building, Salt Lake City, have six claims, with a vein extending 4500 feet in length. The vein is from 12 to 20 feet in width on the surface, which is opened up by several shafts from 10 to 60 feet deep, besides the main shaft which is down 450 feet deep, comprising a shaft 200 feet vertical and 250 feet in the nature of an incline drift along the course of the vein to the west. This incline drift has opened up a body of ore for almost its entire length from 6 feet to 14 feet wide that will run from 18% to 28% copper. The mine is equipped with a horse whim. They are going to install a steam hoist and possibly air compressor and drills, and sink the vertical shaft to the 400-foot level, when they will be able to extract their ore in sufficient quantities for the market.

Salt Lake, August 25.

JUAB COUNTY.

(Special Correspondence.)—The Centennial-Eureka M. Co. of Eureka, which

was closed down for a year, has fifty men employed straightening up around the mine. They have finished retimbering the shaft and expect within the next few weeks to be taking out ore and employing about 200 men. They are overhauling the tramway and terminals, getting ready to handle the ore. They have a double-compartment shaft with double-deck cages. The shaft is 1600 feet deep. The mine is equipped with 660 H. P. engine and 360 H. P. hoilers. They have a machinshop in connection with the mine. The ore is gold, silver and copper, which will be shipped to the U. S. smelter at Bingham Junction, which is nearing completion. R. A. Brown is superintendent.

The Uncle Sam Con. M. Co. of Eureka is working thirty men at present, doing development work. They are not shipping any ore, except from the Humbug—three to five cars per week. The ore contains gold, silver and lead.

Eureka, Aug. 25.

SALT LAKE COUNTY.

The Bulletin reports that in the tunnel 300 feet below the old works of the Bully Boy (United Bingham) a 12-inch streak of black galena is opened up, 64½% lead, 1.6% copper, 30 ounces silver and \$1 in gold per ton. It apparently contains an excess of iron over silica and should sell for close to \$60 per ton.

SUMMIT COUNTY.

The new mill on the properties of the D. & M. M. Co. at Park City has started up. It is stated that the ore will afford as a crude product 12 ounces silver, 14% lead and \$4 gold.

The shaft on the property of the Raymond M. Co., north of Eureka, is now down 1050 feet.

TUCKER COUNTY.

(Special Correspondence.)—The Utah Shale Co. has completed a process for extracting oil from shale ore. They have about 2000 acres near here, 82 miles south of Salt Lake. The vein is 42 feet thick and carries 48% oil. The process is continuous fractional distillation. They are able to save about two barrels to the ton. The oil is a high-grade lubricant and, being distilled, is chemically pure. The property is close to the station. The shale furnishes fuel for the distillation. They will erect a plant for extracting twenty barrels per day between now and the coming fall. Patents are being obtained on the process.

Tucker, August 24.

WASHINGTON.

FERRY COUNTY.

Manager Szontagh of the Northport plant is of the opinion, without having taken up the matter at great length, that the solution to the problem of reducing Republic ores is to roast the product of Republic mines slightly, as is done in Cripple Creek, and then submit them to a cyaniding process. He points out, however, that details must be worked out as the result of lengthy experiments. The Republic ores are not desired at Northport on account of their highly siliceous character.

LINCOLN COUNTY.

The Turk M. & M. Co. at Davenport will install a matting plant upon their property in Cedar canyon, capacity 200 tons, to handle the output of Cedar canyon and the Meteor camps, and the coal will be transported up the Columbia river from Wenatchee.

OKANOGAN COUNTY.

A. G. Wehe, manager Night Hawk, has the tunnel in 515 feet.

SNOWHOMISH COUNTY.

The Victory group, west fork of Silver creek, above Mineral City, has been bonded to Minneapolis men for \$30,000, \$5000 cash. There are six claims in the group. The ore consists of chalcopryite, arsenical iron and galena, carrying gold, silver and copper.

SPOKANE COUNTY.

Spokane reports that a committee of lead mine owners has been appointed by the mine owners to investigate the practicability of maintaining independent smelters at Spokane and Danver. The reason assigned is that the Western lead miners have been unable to get fair dealing from the lead trust, and now propose to manufacture their own product and market it. The men in the new deal produce 45% of the lead mined in the United States. The Spokane smelter would use ores from Republic and the Cœur d'Alenes.

STEVENS COUNTY.

The Northport smelter has a supply of lime rock, mined in a quarry 4 miles from the smelter and delivered at the plant for 51 cents a ton.

WYOMING.

The following expenditures and betterments are reported planned for the Ferris-Haggarty mine: Improvements to mine, \$200,000; smelter enlargement and converter, \$150,000; concentrator, \$140,000;

dam and pipe line, \$100,000; electric pipe line, \$50,000; water works and reservoirs, \$60,000; total, \$700,000. With the \$1,000,000 paid for the mine and \$300,000 for the Southern Wyoming tramway, the company will have expended \$2,000,000.

CARBON COUNTY.

J. S. Carey, president North American Copper Co. and Mine & Smelter Supply Co., and W. G. Emerson, president Southern Wyoming Tramway Co., will transfer the Ferris-Haggarty copper mine to the North American Copper Co., the corporation recently organized for the purpose of consolidating interests in the Grand Encampment and Battle Lake mining districts. The first payment of \$250,000 on the purchase price of \$1,000,000 will be made Sept. 1; second payment of \$250,000 to be made within six months; but the purchasers are not to take any ore from the mine until this payment is made. The third and fourth payments are to be made at intervals of ninety days from the date of the second payment, so that the entire sum of \$1,000,000 will be paid in full within one year from Sept. 1, 1902. The first six months will be devoted to development work in the underground workings, and putting the mine in shape to produce on an extensive scale. The last towers of the Grand Encampment-Battle Lake aerial tramway have been erected, and next the cables will be strung clear through from the smelter at Encampment to the Ferris-Haggarty mine. Work is progressing on the electric power plant at Encampment, to generate sufficient power from the waters of the north fork of the river to run the tramway, smelter and Ferris-Haggarty mine.

Work in the Ferris-Haggarty copper mine resumes Sept. 1. The tunnel is now in 1050 feet; about 100 feet more work remains to be done to bring the breast of the tunnel under the old shaft. An upraise of 60 feet will make the opening into the old workings.

LARAMIE COUNTY.

The Globe Copper Mining Co., Silver Crown district, formed of Colorado Springs men, own 430 acres of valuable land and are developing it. A double-compartment shaft has been sunk 150 feet and work is progressing.

FOREIGN.

AUSTRIA.

The Austrian mercury mines are situated at Idria, in the Province of Carniola, and are a government undertaking. They have been worked upwards of 300 years, the third century having been completed in the year 1880. About 1200 workmen are in regular employment. The working day consists of eight hours if in the mine, and ten hours if outside. The mine produces annually about 800,000 quintals of raw material. Three blasting furnaces exist. Five thousand quintals of pure commercial mercury is produced, and 460 quintals of vermillion, per annum. The total revenue in 1870 rose to 2,000,000 florins, but in 1880 it fell to 385,000 florins. The latest statistics have not been published. From paragraphs that have appeared in the local newspapers, it would seem that the mines are not working quite satisfactorily, and there is some talk of closing the works. Mercury has been recently discovered at Spizza, in Dalmatia, and it promises good results. A commission has been appointed to study the question.

BRITISH COLUMBIA.

At Grand Forks the Granby smelter, which was closed down, owing to the coke famine, resumed operations last week. The ovens of the Crow's Nest Coal Co. at Michel are now turning out 200 tons of coke daily.

The July returns from the Ymir mine show that fifty stamps were in operation 675 hours, the estimated profits amounting to \$6850, besides \$3730 for development and \$1390 for repairs, etc. The total net profit made by the mines during the first half of the present year is \$52,535.

The Velvet mine has resumed shipments. This time the ore is being sent to the Northport smelter.

The Cariboo Development Syndicate of Rossland is buying property in the Lardeau. The Mohican group of three claims has been acquired. The Mohican is a tunneling proposition, giving assays of \$80 per ton. The group is 12 miles from the smelter at Ferguson.

Forty-three thousand eight hundred and fifty-four dollars is the value of the ingot sent from the Consolidated Cariboo hydraulic mine at Bullion to the assay office at Vancouver.

MEXICO.

CHIHUAHUA.

The Guggenheim Exploration Co. has started its new 450-ton mill and the machinery is found to be most thoroughly satisfactory.

The Guggenheim E. Co. has the Madronos group of mines from J. F. Johnstone under bond and lease.

The Compania de Fundadora de Fierro y Acero, of Monterey, have begun elaborate development on two properties secured in the El Valle district.

The Guggenheim E. Co. have started their new 450-ton mill.

OAXACA.

Masterson & Brower of El Paso, Texas, have bought from the Oaxaca M. & M. Co. the Castras Ana group of gold mines, 50 miles from Oaxaca; \$800,000 in gold is to be paid for the property.

SONORA.

Heavy rains are reported in the Altar district. The reservoir of the Sonora M. & M. Co., at Penasco Quemado, is filled with water, which means blowing in of the smelter and a long run.

The Cananea, Yaqui River & Pacific Railroad Co., E. Randolph president and general manager, will put engineers in the field to find routes for extensions of the Cananea road north and south. The plan contemplates a road north and south through Arizona and into the coal fields of New Mexico and Colorado, and south from Cananea lines will be run along the coast of the Gulf of California through Sonora and into Sinaloa.

"All of our skilled labor in the Pintos mine at San Jorge are Yaqui Indians," says H. Heffrin, one of the owners of the Pintos property in Sonora. "As workmen, they are superior to the best Mexicans we can get. All of our blacksmiths and men in positions where the work is most difficult, and where head work is required, are the Yaquis. They are intelligent and industrious. They are unlike any of the other Indians. Some of them are fighters, but those in our employ are harmless. San Jorge is 250 miles from the nearest railway station—Gila Bend, Ariz. We are in the wildest part of the country, but there is plenty of gold that may be taken out at a profit in spite of the great distance from railway facilities."

From C. A. Kaiser, assistant manager Yaqui Copper Co., Campo Santo Nifio, the Oasis learns that there are 150 men at work underground, others being put on, and it is anticipated that by October 1 there will be 500 at work in ore.

NOVA SCOTIA.

(Special Correspondence.)—The Napa mine at Wine Harbor is taking out twenty tons of ore daily from the 50-foot level. Between the walls they are breaking 14 feet of quartz and slate—principally quartz—milling 3½ dwts. per ton. They have a 15-stamp mill, hoisting engine and pump. This property had been abandoned for many years and has recently been pumped out by L. W. Getchell.

The Plover Lead M. Co. at Wine Harbor is owned and operated by J. S. Lowe general manager, M. McGrath superintendent, and has been worked two years. These people have a 15-stamp mill, hoisting and pumping plant. They are down 190 feet. At that depth their ledge is 18 feet between walls. The ore is milling 7 dwts. per ton.

The Royal Oaks mine at Goldenville is owned by Boston and Nova Scotia men and managed by J. W. McIntosh of Nova Scotia. They have 300 acres and six distinct ledges varying in width from 6 inches to 8 feet. The principal ledge on which they are now working is down 160 feet, which is 3 feet wide at the bottom. Levels are driven every 50 feet. They are milling thirty tons per day—6 dwts. per ton. They have a 10-stamp mill in operation and ten more stamps ready to start up. They have two hoisting plants and one pumping plant. This company is using American made machinery.

The Lake Lode mine at Caribou is owned by L. W. Getchell and A. S. Dunham of Baltimore, Md. They have a double-compartment shaft down 700 feet, the deepest in Nova Scotia. At the 700-foot level the ledge is 6 feet and mills 3½ dwts. They have a complete 40-stamp mill, a 10-drill air compressor, 40 H. P. hoisting plant and 100 H. P. engine. They are mining and milling their ore at a cost of \$1.25 per ton.

The mining companies in this country cannot own the ground; they lease from the Government. Mining property is divided into areas. An area is a fraction less than one acre. The mining company leases this area from the Government at 50 cents per annum. They also pay a royalty of 2% on all ore extracted. If the royalty exceeds the rent collected for the area, the rental is deducted.

Wine Harbor, Aug. 5.

ITALY.

C. B. Flynn, who has interests in American and Mexican copper mines, has organized the Anglo-Italian Copper Syndicate, which has purchased 12,000 acres near Genoa for carrying on its business. Orders for smelters of 500 tons daily ca-

capacity of ore have been placed in Germany and the United States.

THE YUKON.

Klondike reports the greatest exodus from Yukon river points now in progress. Not since the rush inward of 1897 and 1898 have so many people been traversing the 700-mile stretch between Dawson and Skagway as now. In two days last week 1200 men started up the river. Five hundred had previously left, and not less than 1500 more will come out between now and September 15. There are several reasons for the exodus. It is primarily hastened by the fierce rate war on between the steamers of the White Pass Railway and independent lines. Rates have been cut from \$60 first class and \$40 second class to \$18 and \$9. Dawson has had a large surplus population all summer. This included 600 men who went in expecting to get work on the Klondike Mines Railway, to be constructed from Dawson up Klondike creek toward Stewart river. Surveys and preliminary work are going on, but construction work has been delayed by non-completion of financial arrangements in New York. These workmen are now coming out rather than winter in Yukon.

Personal.

D. McVICHIE has returned to Salt Lake, Utah, from Boston.

JAS. FINLEY is resident manager Sullivan mine, Fort Steele, B. C.

J. P. BOYLE is superintendent April Fool mine, De Lamar, Nev.

VALENTINE HAY is examining mines at Pyramid district, Nevada.

A. R. GIBSON is examining mining properties at Clifton, Arizona.

C. K. McCORMICK has returned to Salt Lake City, Utah, from Europe.

J. A. BUSH is reporting on Idaho Springs, Colo., mining property.

E. H. MacDonald has been appointed city engineer of Anaconda, Mont.

A. L. NATHAN has been elected superintendent Telluride, Colo., Coal Co.

D. B. WHITMAN is now foreman Arizona-Colorado property, Globe, Ariz.

W. S. MARSHALL is manager Idaho Springs, Colo., Gold Producing Co.

JOHN BLACKFORD is superintendent Golden Reward mines, Terry, S. D.

J. T. DONAHOE is the new superintendent of the Gold Eagle group, Boise, Idaho.

D. W. SHEPARD is superintendent Anglo-Saxon M. Co., Georgetown, Colo.

N. B. KNOX of San Francisco has been examining the Erie mine at Graniteville, Cal.

O. R. SMITH now represents the International G. M. & M. Co. at Lordsburg, N. M.

L. BAMBERGER of Salt Lake, Utah, is examining mining property at Bolse Basin, Idaho.

MR. H. GRAHAM, manager Frazer River Gold Dredging Co., is dredging near Lytton, B. C.

SUPERINTENDENT SIEBERT of the Tonopah mines has returned from San Francisco.

M. B. FITCH, Magdalena, N. M., is the new superintendent Columbia M. Co. at Esther, Mo.

A. H. PHILLIPS of Trenton, N. J., mineralogist for Princeton University, is at Butte, Mont.

ASA BALDWIN is consulting engineer Ohio-Deadwood G. M. Co., Deadwood, South Dakota.

F. M. ISH, manager Weepah M. Co., Nevada, is at Owens river examining sites for water power.

WILLIAM BLACK is in charge of the new sulphuretted works at the Delhi mine, Nevada county, Cal.

F. M. MILLER, of Grass Valley, Cal., is examining the Leland and Mitchell properties, Boundary Cove, Arizona.

CHARLES BUTTERS is expected in Cripple Creek district, Colo., to erect a plant for treating low-grade ores.

EDWARD G. WITT, 137 First street, is the San Francisco representative of F. W. Braun & Co. of Los Angeles, Cal.

HUGH ROSE of the War Eagle and Center Star M. Cos., Rossland, B. C., has returned from Cripple Creek, Colo.

C. H. PALMER, formerly manager Butte & Boston Co., Butte, Mont., is examining mining properties at Sheridan, Mont.

A. STANSFIELD, professor of metallurgy at McGill University, Montreal, Canada, has returned there from Nelson, B. C.

W. ROSLINGTON, representing F. W. Braun & Co., Los Angeles, Cal., is traveling through the Black Hills (S. D.) districts.

G. A. OVERSTROM of Chicago, patentee

of the Overstrom table, has been in Park City, Utah, placing one of his tables at the Silver King mill.

J. B. HIGGINS has been appointed superintendent of the Mill Creek mine, Plumas county, Cal., recently purchased by M. C. Miller of Minneapolis.

HARRY MARTIN, former superintendent Iron Mask mine, Rossland, B. C., has gone to Butte, Mont., as foreman in a mine under the superintendency of S. Hall.

DUNCAN McDONALD of Virginia, Nev., has gone to San Salvador, where he will have charge of the underground workings of a mine owned by the Charles Butters Co.

C. M. EYE has resigned as superintendent Alpine mine, Georgetown, Colo., to take a position with the War Eagle Con. M. & D. Co. as smelter representative at Trail, B. C.

W. J. COX, superintendent Mollie Gibson and A. J. properties, Cripple Creek, Colo., has resigned and goes as superintendent and manager Camp Bird mine, Ouray, Colo.

F. MERTSHEIMER has been appointed superintendent of machinery of the Denver & Rio Grande Railway, with office at Denver, Colo., succeeding H. Schlacks, who resigned.

C. F. SCOTT, chief electrician of the Westinghouse Electric & Manufacturing Co., and president of the American Institute of Electrical Engineers, has returned from England.

G. D. B. TURNER, former manager Revenue mine, Madison county, Montana, is now managing the property of the J. I. C. Co., Park City, Utah, and is sinking a 600-foot shaft.

ALEXANDER BARING of London, England, who made a recent trip from Sumpter, Or., to Portland, Or., is locally credited with a desire to buy the E. & E. mine from Jonathan Bournie.

E. G. RUST, general superintendent Colorado Fuel & Iron Co.'s works at Pueblo, Colo., and A. H. Helander, chief engineer, have resigned to open an engineering office in Philadelphia, Pa.

Catalogues Received.

"Catalogue No. 15, 1902, The Jackson Hand Power Rock Drill & Equipment," describes and illustrates this mechanical device and tells just what a miner would want to know about it. A request to the Denver office, 1758 Larimer street, or to 52 Broadway, the New York office, to H. D. Crippen, will bring it to any address.

The American Engineering Works, 204 Dearborn street, Chicago, Ill., has a new circular (No. 22) describing the Overstrom plug for use in concentrating mills, a solid rubber plug designed to displace the wooden plugs used. It is made in all sizes likely to be in demand and has an internal cone of such form that the opening will not be easily clogged with sticks or refuse. They show in their circular a full size cut in end view and section.

The current edition (August, 1902) of the Lunkenheimer Co.'s illustrated Catalogue and Price List is rewritten and revised, and, as is the usual style of this company, has a distinctive value. Any one reading this 208-page booklet must be favorably impressed by its clear-cut, concise, down-to-date compendium of information on valves, injectors, lubricators and steam specialties. A request for a copy to any of the company's addresses—Cincinnati, Ohio; Denver, Colo.; 26 Cortlandt street, New York City; 27 North Seventh street, Philadelphia; 35 Great Dover street, London, S. E., England—will be immediately complied with.

Catalogue No. 126 of the Chicago House Wrecking Co. contains 240 pages of illustrated description of a very large variety of merchandise. The company buys big lots at sacrifice values, dismantling such mammoth enterprises as the World's Fair of Chicago, the Trans-Mississippi Exposition of Omaha, Neb., the Chicago post-office, etc. Their establishment covers 1,000,000 square feet of space in which they have a vast amount of material that is offered at prices that merit the attention of close buyers. They invite visitors to see their extensive warehouses, and will send a copy of the catalogue upon application to the Chicago House Wrecking Co., West 35th & Iron Sts., Chicago, Ill.

Commercial Paragraphs.

ALLIS-CHALMERS CO. at their Denver office have the order for all the machinery necessary to increase the bromide plant of the Telluride Reduction Co. at Colorado City, Colo., from 100 tons of ore to 300 tons per day. The increase consists in part of two 100-ton Wetthey mechanical

roasting and cooling furnaces, two 100-ton revolving driers, four large sets of rolls, the necessary Montejus tanks, elevators, screens, etc., aggregating 300 tons of machinery. The Denver office of Allis-Chalmers Co. also reports the sale of a first motion hoisting engine to the Theresa G. M. Co., Goldfield, Colo.

THE Denver Engineering Works Co. has shipped a complete 10-stamp mill, including complete sawmill plant, to R. B. Pratt, Thomasville, Colo. In this mill will be used one of the new hydraulic classifiers developed by them from experiments and data obtained by Professor Richards on this subject. They are also shipping material for a 40-stamp mill for the Penobscot Mining Co., Deadwood, S. D. They will have ready for distribution their Spitzkasten, or Hydraulic Classifier Bulletin, by September 1. They state that by the use of this new Spitzkasten, or hydraulic classifier, the Gregory-Bobtail mill at Black Hawk, Colo., has increased the savings of values from the ore from 55% to 90%.

C. P. MASON, manager Fairbanks-Morse Co. of Salt Lake City, Utah, reports the following sales: One gasoline motor car; one large water heater and purifier for Idaho; one set 18 inch Sturtevant high-speed rolls, three Sturtevant toggle screen separators for Mayday mill, Eureka, Utah; twenty-two assorted scales for mines, merchants, consumers, railroads and smelters; 54 H. P. gasoline engine; sixteen gasoline engines, with centrifugal pumps, for irrigation in Idaho; three horse whips, five ore cars, carload sixteen-pound rails, wire rope and supplies for iron mines, Cedar City, Utah; wire rope and supplies for Tonopah district, Nevada; three mining cages, six mining cars, ore skip, four gasoline hoisting engines from 12 H. P. to 44 H. P., two 60 H. P. gasoline engines for Tonopah, Nevada, for air compressor duty.

AT Sobrante, Cal., the new plant of the International Explosives Co. is being completed, nine wooden buildings adjoining the works of the Giant Powder Co. The company is capitalized at \$1,000,000 and owns 52 acres of land. A. B. Holland, of Oakland, is president; R. B. Mott, vice-president; F. Dassonville, secretary, H. C. Stillwell, general manager. The daily capacity of the plant with the present amount of machinery is 2000 pounds of powder. This capacity can be increased by erecting one additional building and more loading machines. A full stock of material is on hand for the manufacture of a new powder. The base is chlorate of potash. This chemical has been very difficult to use on account of a tendency to explode, but the inventor of the process, W. C. Quimby, is stated to have a safe method of working it. It is mixed with other chemicals in a dry state. No acid is used; this reduces the cost considerably, as the acid plant is a large item in the cost of plants for the manufacture of nitroglycerine powders. The officers state the new powder gives off no nitrous-oxide fumes, will not freeze and is not affected by climatic influences. It is claimed that it can be produced cheaper than the nitroglycerine powders and will not explode by concussion. The saving in expense on No. 2 powder is said to be 2 cents per pound. The new company is not connected with any pool or combination, is not restricted to any particular territory for a market, and proposes to export powder.

It is an idea with some present and prospective advertisers that pleasant personal mention in the columns of a trade paper are vastly valuable. While mention in any way in a journal of considerable circulation is of value in creating publicity, yet there is a tendency at times to overestimate the value of "puffs" and laudatory mention. No rightly constituted man objects to favorable mention of himself or his business in a paper seen by prospective patrons, and no properly conducted journal objects to such favorable mention when deserved; but, after all, such mention is of minor importance to the matter of general interest. The question for an advertiser to consider is not, "Will that paper say nice things about me?" but "Has that paper the circulation among probable customers that would justify my paying for space in its advertising columns?" Is the paper of sufficient value to men likely to be my customers to induce them to buy it? Men don't buy a paper for the pleasure of seeing the handsome personal paragraphs it may publish about the clever Mr. A., or the rich Mr. B., the great Mr. C., or the eminent Mr. D. Men buy it for news, information, and in their work, and, just so far as it is able to supply the wants or expectations of its subscribers, it prospers. The paper that is of real value to the advertiser is not the one that is filled with little personal puffs and praise of people, cared for only by those so puffed and praised. The

trade paper of value to the advertiser is filled with the latest and most authentic general and technical information on the subjects of greatest general interest in its line, and in which the personal element is subordinated to the requirements of a great many men who want the latest and best concerning their daily business.

Clifton, Ariz., Copper District.

A comprehensive report of the occurrence of copper in the vicinity of Clifton, in southern Arizona, is being prepared by W. Lindgren, geologist of the U. S. Geological Survey. The field work on which the report is based was commenced early in November last. The mines near Clifton produce at present approximately 2500 tons of copper a month, and the mining district ranks third among the copper producers of the Territory, only United Verde and Bisbee exceeding it. The Geological Survey had previously prepared a detailed topographic map of the region, and the geologic work begun in the autumn was completed in the winter. Special attention was given to a study of the mines, in which portion of the work four months were spent. The results will be of general interest, as the investigation largely dealt with the secondary concentration so common in copper deposits, and also with the character of the original deposits, which are remarkable, inasmuch as they consist of masses of limestone altered by contact-metamorphic processes.

Production of Lead.

The production of lead in the United States in 1901, says Charles Kirchhoff in Mineral Resources of the United States, 1901, now in press. United States Geological Survey, was fully up to the high total which was attained in 1900, although the output of individual districts varied somewhat.

The total production of refined lead in 1901 amounted to 381,688 short tons, as compared with 377,679 short tons in 1900. Of this total production in 1901, the net American production was 270,700 short tons, almost exactly the same as in 1900.

The total output of the Mississippi valley footed up to about 67,000 tons, or about one-fourth of the whole production of the country. Idaho continues the principal contributor, fully 75,000 tons of the total coming from that State, and nearly all being the product of the Coeur d'Alene mines. Colorado yielded about 73,000 tons in 1901, Leadville remaining the largest single district, although in 1901 this district furnished less lead than in former years. The production of Utah has been well maintained, the quantity being 49,870 short tons, about 1800 tons in excess of the production of 1900.

The estimated consumption of lead in 1900 was 269,905 short tons, as compared with 269,302 tons in 1900, and with 226,315 tons in 1899.

The total value of the lead imported for consumption in the United States in 1901 was \$364,459, as compared with \$702,213 in 1900. The value of the exports of lead from this country in 1901 was \$624,534, as compared with \$459,571 in 1900.

During the first eleven months of 1901 the price of lead was maintained at 4.375 cents at New York, but in December the American Smelting & Refining Co. reduced the price to 4 cents. During the whole year the lead market was held stationary by main force, although the quantities which consumption would not absorb were added to the stock in first hands. Low prices prevailed in Europe during the year, and toward the close of the year they reached a figure in the London market which is equivalent to 2 40 cents per pound here.

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING AUG. 19, 1902.
707,191.—NEEDLE THREADER—O. A. Alcardi, S. F.
707,292.—TUBE EXPANDER—H. M. Barr, Wadsworth, Nev.
707,195.—POSTAL BOX AND SIGNAL—F. C. Bates, San Jose, Cal.
707,297.—CHUTE—F. W. Brink, Tacoma, Wash.
707,385.—ORE BREAKER—A. C. Calkins, Los Angeles, Cal.
707,307.—CAN OPENER—J. Chisholm, Fort Liscum, Alaska.
707,028.—RIBBON FASTENER—F. O. Garrison, Portland, Or.
707,321.—CLUTCH—H. B. Harding, Los Angeles, Cal.
707,250.—ROOF, ETC., CONSTRUCTION—B. McDougall, S. F.
707,340.—RUNNING GEAR—A. A. Medina, San Jose, Cal.
707,161.—SURVEYING INSTRUMENT—J. C. Sala, S. F.
707,359.—BICYCLE GEAR—P. J. Scharbach, Pe Ell, Wash.
707,287.—THRESHER—J. G. Walker, Moro, Or.

Latest Market Reports.

SAN FRANCISCO, Aug. 29, 1902.

METALS.

SILVER.—Per oz., Troy: London, 24½d (standard ounce, 925 fine); New York, bar silver, 52½c, refined (1000 fine); San Francisco, 52½c; Mexican dollars, 440 San Francisco, 41½c New York.

COPPER.—New York: Standard, \$10.75@11.15; Lake, 1 to 3 casks, \$11.55; carload lots, \$11.40; Electrolytic, 1 to 3 casks, \$11.30; carload lots, \$11.00; Casting, 1 to 3 casks, \$11.40; carload lots, \$11.25. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £51 10s spot per ton.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £11 2s 6d per ton.

SPELTER.—New York, \$5.50; St. Louis, \$4.50; London, £19 2s 6d per ton; San Francisco, ton lots, 6c; 100-lb lots, 6½c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$27.80; San Francisco, ton lots, 29c; 1000 lbs., 29c; 500 lbs., 29c; 200 lbs., 29c; less 30c; bar tin, 30c, 35c. London, £125 12s 6d spot.

PLATINUM.—San Francisco, crude, \$18.00 @ oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$48.00 large lots; London, £8 15s; San Francisco, local, \$46.00 @ flask of 76½ lbs.; Denver, \$49.75. Export, \$44.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 19.50c; San Francisco, Plumbers', 100-lb. lots, 16½c.

NICKEL.—New York, 50@60c @ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$21.75; gray forge, \$21.00; San Francisco, bar, 3c @ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$31 and \$32; open hearth billets, \$33 and \$34; San Francisco, bar, 7c to 12c per lb.

Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton,

15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c @ set; 14 oz., 40s., 9c.

COAL.—San Francisco, coast, yard prices: Wellington, \$3; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$3.00. Cargo lots, Eastern and foreign: Wallend, \$7.00; Brymbo, \$7.50; Pennsylvania, h.d., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$11.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50; long ton, Colorado Anthracite, \$14.00. Coke, \$13 per ton in bulk, \$15 in sacks; Sunnyside, \$11.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 27@28c @ lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 66% B, 2c @ lb.; soda ash, \$2.00 @ 100 lbs.; hyposulphite of soda, 24@30c @ lb.; blue vitriol, 54@63c @ lb.; borax, concentrated, 7@8c @ lb.; chlorate of potash, 12@13c; red sulphur, 5c; alum, \$2.00@2.25; flour sulphur, French, 24@25c; California refined, 14@25c; nitric acid, in carboys, 8c @ lb.; caustic soda, in drums, 34@40c @ lb.; Cal. s. soda, bbls., \$1.25 @ 1.50 @ 100 lbs.; sks, \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linsseed, boiled, bbl., 69c; cs., 74c; raw, bbl., 67c; cs., 72c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 59c; cs., 64c; raw, bbl., 57c; cs., 62c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Ecocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls., 19c; wooden bbls., 22½c; cs., 25c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 88° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22c; Lard Oil, No. 1 bbl., 95c; cs., \$1.05; Neats-foot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 62½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, cs., 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6½c; 1 ton and less than 5 tons, per lb., 6½c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ¾c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7½c; less than 500 lbs., 7½c.

ASSAY LITHARGE.—Per lb., 8½c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—40 @ lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, 30c, 60c.

MAGNESIUM.—Per lb., \$3.00.

MANGANESE.—(90% and over) @ lb., \$1.25.

MERCURY.—Bichloride, @ lb., 90c.

MOLYBDENUM.—25c @ gramme; 1000 grammes—2½ lbs.

PHOSPHORUS.—(American) @ lb., 80c.

SILVER.—Chloride, @ oz., 75c; nitrate, 55c.

SODIUM.—Metal, @ lb., \$1.00.

URANIUM.—Oxide, @ lb., \$3.50.

ZINC.—Metallic, chemically pure, @ lb., 50c.

ZINC.—Dust, @ lb., 10c.

ZINC.—Sulphate, @ lb., 10c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

POSTAL BOX AND SIGNAL.—No. 707,196. August 19, 1902. F. C. Bates of San Jose, Cal. Assigned to Bates-Hawley Postal Box Signals Co., a corporation, of same place. The object of this invention is to provide a signal device attached to postal boxes and operated by the opening thereof so that the signal is exposed and indicates to the proper person that there is something in the box for removal, and to drop the signal after the contents have been removed. The box is so constructed as to prevent the entrance of dampness from storms, and the doors are so disposed that the largest packages may be introduced or removed and the box fully exposed for inspection.

ROOF, CEILING AND FLOOR CONSTRUCTION.—No. 707,250. August 19, 1902. B. McDougall, San

Francisco, Cal. This invention comprises improvements in the construction of floors, ceilings and roofs so that a horizontal partition can be constructed with a minimum depth and weight consistent with the necessary strength and which shall depend solely upon the walls for support, obviating the necessity of supporting columns, cross walls, trusses or arches. It consists of a series of joists or bars radiating from a common center, having the outer ends fully supported and concentric bands or rings engaging the bars and uniting them into a rigid structure, together with interspersed strips, and means by which all the elements are firmly secured together.

NEEDLE THREADER.—No. 707,191. August 19, 1902. O. A. Aleari, San Francisco, Cal. This invention provides a mechanical means for threading needles of any character. It consists of a support or stand, a horizontal guide, a threader reciprocable along the guide and a needle holder in the path of the threader, with means by which the needle is always made to present its eye to the threader and to be engaged thereby. The means are provided for adjustment and for severing the thread.

TUBE EXPANDER.—No. 707,292. August 19, 1902. H. M. Barr, Wadsworth, Nev. This invention is designed to expand the ends of tubes after they have been placed in the heads of the boiler. It consists of a reeling tool comprising revolvable rollers, a mandrel or spreader, a sleeve screw threader arranged in the casing and a reel, which the mandrel is adapted to abut as it is driven home, and a suitable gauge plate. The spreader will automatically release itself after the tube has been properly expanded.

ASSESSMENT NOTICES.

MARINA MARICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of August, 1902, an assessment (No. 3) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 415 Front street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 28th day of September, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 29th day of October, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

OHAS. BOVONE, Secretary.

Office—415 Front street, San Francisco, California.

VALLEY WATER COMPANY.—Location of principal place of business, No. 316 California street, San Francisco, California; location of works, near Coalinga, San Bernardino County, California.

Notice is hereby given, that, at a meeting of the Board of Directors, held on the 22nd day of August, 1902, an assessment (No. 3) of five dollars (\$5) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 316 California street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 23rd day of October, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

R. A. LEWIN, Secretary.

Office, No. 316 California street, San Francisco, California.

DELINQUENT SALE NOTICE.

MAYDAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 6) levied on the 10th day of July, 1902, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Shares.	Am't.
J. P. E. Helntz.....	126	\$ 8.75
O. G. Ven Treutler.....	127	400
George Schoenwald.....	131	100
Frank Weeks.....	133	500
J. P. E. Helntz.....	135	200
A. A. Archer.....	147	100
Duncan S. Hayne.....	157	1,000
Duncan S. Hayne.....	164	250
A. Feist.....	165	1,250
A. Bowdler.....	168	500
Edith A. E. Lyman.....	171	100
Charlotte H. Wright.....	172	100
Edmunds Lyman.....	173	50
Malcolm Moulder.....	174	50

And in accordance with law, and an order from the Board of Directors, on the 10th day of July, 1902, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, at Head's Business College, 24 Post street, San Francisco, California, on THURSDAY, the 15th day of September, 1902, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

EDWARD H. STEARNS, Secretary.

Office of the Company—Head's Business College, 24 Post street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from Stockton Gravel Mining Co., a Philadelphia, Pa. Co., to mine at Feather River, Calif., to deposit tailings in Eagle Creek drainage into Stanislaus River; from Manuel Leal, in South Honcut Mine, near Bangor, Butte County, Cal., to deposit tailings in South Honcut Creek, draining into Feather River; from John Solari and Rocco Molinari, in Marble Canyon, near Colusa, Colusa County, Cal., to deposit tailings in Sutter Creek drainage into Sacramento River; from C. C. Beaver, in Union Mine, at Brownsville, Yuba County, Cal., to deposit tailings in Dry Creek drainage into Yuba River; from Dardanelles Consolidated Gravel Mining Co., in Dardanelles and Oro Mine at Forest Hill, Butte County, Cal., to deposit tailings in Dardanelles Canyon, draining into Middle Fork of American River; and from Thomas & Bayliss, in Gold Run Placer Mine, at Elizabethtown, Plumas County, Cal., to deposit tailings in Spanish Creek drainage into Feather River; give notice that a meeting will be held at room 16 Flood Building, San Francisco, Cal., on September 15, 1902, at 1:30 P. M.

CHICAGO SCHOOL OF ASSAYING.

Courses in Assaying and Ore Testing. Courses in Chemical and Metallurgical Analysis. Courses for Miners and Prospectors. Instruction individual. Enter any time. Open evenings. J. DUNRYEN YOUNG, Director, 1733 Monadnock Building.

SITUATIONS WANTED.

WANTED.—Employment as assistant assayer. Address K. G. A., care of this office.

A mining engineer with thorough technical and business training and 12 years experience as manager, superintendent and engineer, proficient in Spanish, wants position with reliable parties. References furnished. Address "Cedres," this office.

MASTER MECHANIC. First class, wants a position with mining company in Ariz. or Mex. Wide experience in all kinds of mining and milling machinery. Reference furnished. Address "Master Mechanic," care Mining and Scientific Press.

Experienced Copper Metallurgist and Mining Engineer will equip, manage or expert such properties. Address Cu, Mining and Scientific Press.

Consulting Mining Engineer, familiar with making examinations of mines, prospects and mineral lands, would like a position with reliable parties. Best references. Address S. A., care of this office.

WANTED.—An all-round miner wants position as foreman. Over 24 years' experience in practical mining and handling men. Best of reference. Address Call Box 29, Weiser, Idaho.

WANTED.—Employment at mine by young, experienced Assayer, Surveyor and Bookkeeper. References. Address A. H., care of this office.

COMPETENT SUPERINTENDENT wants position in California; 15 years' experience in running mines, mills and smelters for profit, and managing men. College bred and technically educated. Formerly held positions as assayer, mining engineer, accountant, superintendent, and manager. Member A. I. M. E. High testimonials. Address "Superintendent," Box 513, Seattle, Wash.

Cyanide and Stamp Mill Superintendent open for engagement. Graduate, thorough assayer and chemist; also accountant. Speaks Spanish. Will go anywhere. Specialty, construction; also successful treatment of low-grade and slimy ores. References "A1." Address PRACTICAL, care of MINING AND SCIENTIFIC PRESS.

ASSAYER AND MILLMAN will be open for engagement after Oct. 1st; has been employed for past two years in one of the largest modern amalgamating and concentrating mills in Colorado; had seventeen years experience in assaying or millwork, seven of which was in a Government Mint. Correspondence solicited with reliable parties only. Address R. S. B., care of Mining and Scientific Press, 606 Mack Block, Denver, Colo.

WANTED.

WANTED.—BY TWO ENERGETIC AND EXPERIENCED mining men the acquaintance of persons interested in the development of mining property in old Mexico. Address D. L. C., care of this office.

Wanted to Bond a Dry Placer Claim, One Rich in 'Flour' Gold.

Must be a dry proposition. Address "Placer Claim," care of this office.

WANTED.

ENGINEERS, MACHINE DRILL MEN AND TOOL SHARPENERS.

Address QUARTZ MINE, care MINING AND SCIENTIFIC PRESS.

WANTED—A MACHINIST.

A good all round man to go to Mexico to take care of silver mill, etc. One who understands Spanish preferred. Address K. C. B., care MINING AND SCIENTIFIC PRESS.

FOR SALE.

FOR SALE.

A Complete Hoisting Plant,

with Gates 50 H. P. Hoisting Engine and two 4-foot 3-inch x 3-foot 6-inch Steel Cages; located at Keystone, S. Dak.

Address THE ELIZABETH MINING CO., 601 Herman Bldg., Milwaukee, Wisconsin.

FOR SALE.

A Complete 40-Stamp Mill,

with No. 3 Gates Crusher, forty-850-pound Stamps, forty-eight Silver Plated Copper Plates, 3 feet x 4 feet 6 inches, and sixteen Wilfley Concentrators. Power for this plant is furnished by three 66-inch x 16-foot Boilers, in connection with one 14x26 and one 16x30 Atlas Engine.

Mill located at Keystone, S. Dak.

Address THE ELIZABETH MINING CO., 601 Herman Bldg., Milwaukee, Wisconsin.

The Mines Exchange, Ltd.

Mines and prospects in British Columbia; the Western States, and Mexico, for sale. Free milling gold properties a specialty. Write us for reports and information. Bank references given.

Address THE MINES EXCHANGE, LTD., P. O. Box 700, Nelson, B. C.

Branch Office: P. O. Box 594, Salmon City, Idaho.

Mining Exhibits at San Francisco, Cal.

Of late years it is the custom, more and more, for conventions of the different fraternal orders in the United States to hold meetings at San Francisco, and with a view to advertising the resources of California displays of different counties have been at times on view in the spacious nave of the Union Depot, at a point where all the thronging thousands arrive and depart.

The last occasion of this sort was in August, 1902, when the "Knights of Pythias" came in conclave, opportunity being given to examine some of the things that are produced on the Pacific coast. There were several fine mineral displays, among them being one from Nevada county, Cal. Through the courtesy of Mr. Samuel Butler of Grass Valley was received a photograph of the display made by that county, an engraving of which herewith appears.

The State of Nevada was also well represented. The exhibition was in charge of G. W. Ingalls, who furnished the photograph from which the accompanying halftone was engraved.

It has been calculated that 150,000 people visited the display during the week it lasted, making it a good advertisement. A permanent exhibit would be a paying investment.

South African Mining Conditions.

There is naturally much present objection on the part of Rand mine owners to the 10% tax announced by the British government and the question is asked, "Wherein do we benefit by the cessation of Boer dominion?" Still, as the mines were the cause of the costly Boer war they must expect to hear some of the hurden. To add to the troubles of the South African mine owner is now announced the ever-present labor trouble. The Kaffir is content with a little, but sees no reason why he should work for the white man at low wages, especially since the license of war times when he learned how to handle a gun and forage on the country.

The mines need 75,000 men and can get but 5000. The dependence for unskilled labor is mainly the native negro, for the Boer is no miner, will not learn to be, while the offer of \$1.25 per day "and found"

to the British soldier is not at all alluring. The negroes are offered about \$9 per month and their keep, but like all such labor, it is cheap only in name; one American miner is worth twenty of those fellows. British empire builders dream of making South Africa a white man's country and aim to induce a quarter million men to go from the overcrowded home country to the new world found there. The idea is commendable in the main, and will ultimately prevail, but just now the demand is for miners.

The matter is referred to here for the purpose of saying that no American miner should think of going to South Africa unless under contract at good salary for a definite time with a responsible company. Anywhere in this country an American miner can

make his way and get to the front by the exercise of the same homely qualities that win success, but if he starts at the bottom in South Africa he'll have to stay there. The only way to win there is to start at the top and have sufficient ability and merit to hold that place. The conditions are against subsequent advancement. Hence, for a variety of reasons that must be manifest upon a little reflection, it were not advisable for a miner from this west half of America to take many chances in looking for spot lucrative employment in South Africa. The odds are against him from the start.

South African mines have paid large salaries to American miners and will continue to, not because they are American, but because they possess the technical and executive ability that justify such salaries, but those salaries are all arranged beforehand, and a man going there knows just what he is to get. Even then they get back to the United States at the first decent opportunity, for they naturally chafe at the rigid conditions so foreign and irksome to a man where one counts for so much as he does here.

So far as miners from this country are concerned, there isn't much change from previous conditions, and our advice to any one without a contract, but thinking of going to South Africa "looking for a job," is to have a good talk with some one who has been there, and if he does conclude to try it to go with his eyes open and not expect too much.

A CONTEMPORARY promulgates the belief that with greater depth the Cripple Creek, Colo., mines will show less and less gold, and that the gold values will disappear at a depth of 1500 feet. Neither fact nor theory will bear out this assumption. Even that heter sort of theory that follows fact instead of preceding theory, the kind of theory that is founded on fact, negatives the idea. This week's report from the El Paso mine, Poverty gulch, Cripple Creek district, gives as more likely fair indication of permanence and continuity as depth is attained, the ore at the 850-foot level being a sulphide combination showing considerable free gold. In Cripple Creek, as elsewhere, the character of the ore is changing as it goes down, but the indications are of a nature favoring belief that the tellurides changing to a sulphide base argue for continuance.

Personal; Commercial Paragraphs; New Patents; Notices of Recent Patents; Catalogues Received; Recently Declared Mining Dividends; Obituary, 129.

WHILE California and Utah excel in great long-distance electrical transmission enterprises, the Middle West affords the most advanced present example of artificial water ways. Four years' work and the expenditure of \$5,000,000 have successfully completed the Sault Ste. Marie water power canal, 224 feet average width, 22 feet deep, 2½ miles long. At the entrance it is 391 feet wide, 18 feet deep, with an estimated flow of 30,000 cubic feet per second. In the power house 320 turbines develop 40,000 indicated horse power. There are eighty dynamos in the electrical equipment, "harnessing" Lake Superior.

BUTTE, MONT., is considering zinc reduction works to treat the great quantity of zinc ore now being profitlessly produced in that district. Treatment of those ores is ordinarily precluded because of less fusibility on the part of the slag, and the choking effect in the ordinary smelter. Even in the ordinary zinc distillation furnace, the marmatite of Butte contains such a percentage of iron and lead as to corrode the retorts, while the Canyon City or Denver, Colo., magnetic processes, so successful with Leadville zinc ores, have not so far made successful commercial return thereon. The Butte zinc ores run from 16% to 30% iron, 2% to 12% lead, 2% to 10% silica, 16% to 35% zinc, 5 to 15 ounces silver and \$1 to \$5 gold.

HEAT generated by oxidization is often a deterring or determining factor in deep mining. In sundry localities at various times it has been noted that the increase in temperature with depth was not regular, being subject to the amount of pyrites in the ground, or to the time that drives in which the temperature was noted had been opened up. In one case at Sandhurst, Victoria, N. S. W., a fall of 5° F. in temperature was noted after the ground had been opened up for one year, and after four years had elapsed there was a further fall and then an unchanged temperature. At a depth of 1700 feet in the Comstock, Nevada, boiling hot water was found, and the statement was then made that a little further down all matter was molten, yet on passing the 2000-foot level

the temperature decreased, the Union shaft at a depth of 3300 feet having a more comfortable temperature than could be found half way to the surface. These local conditions are well exemplified in the Lake Superior region, where there appears to be a local cold zone, the temperature in the Calumet & Hecla shaft at 4700 feet being 79° F., only 20° warmer than at a depth of 100 feet.

THE Broken Hill Proprietary Co., New South Wales, always furnishes an interesting report. For the half year ending May 31, 1902, General Manager Delprat shows that the desulphurization of slimes by roasting there is of sufficient value to warrant extensive operation. Complaint is made of the onerous tax, as in the case of British Columbia, being even "more than the traffic will bear," there being a 50% duty on the f. o. b. value of the imported Oregon pine for timbering. Still there was a gross profit for the half year of £68,236 16s. 10d., which deducting £20,295 4s. 9d. for depreciation, leaves a net six months profit of £47,941 12s. 1d. The output of silver was 2,554,169 ounces fine; lead, 32,289 tons; gold, 13,350 ounces; copper, 13 tons. The saving in the working costs is about balanced by the reduction in value of the company's products.

THE technology of copper mining is simpler than it was a dozen years ago, and better understood by miners. The business of copper mining—the commercial side of the mining—is, however, more complex than a dozen years ago, and (if the diverse opinions published concerning it are to be accepted) less understood than it was then. There is an intimate connection between the better understanding of the technical part of copper mining and the more apparent misunderstanding of the commercial part of copper mining. Copper is obtained from two classes of ores; one, in which copper is the only value recovered; the other, in which copper, silver and gold, with or without lead and zinc, are recovered as commercial values. The first class is practically limited to Lake Superior native copper ores, the little silver the copper carries just paying its cost of electrolytic parting. The second class includes the oxide and sulphide ores mined in Montana, Arizona, California, and nearly everywhere else that copper is produced. The first class, which a few years back furnished the larger part of the world's copper production, now furnishes the lesser part by reason of the increased production from the ores of the other class. The total amount of copper obtained from the Lake Superior ores bears a direct relation to the sale price of the metal. When the price is high, ores containing a less quantity of copper are mined than when the price is low. The total amount of copper obtained from ores of the second class is not so directly affected by the sale price of the metal. Much depends on the other recoverable values. They pay, in any event, part of the cost of the production of the copper; they may pay all its cost, or they may pay the cost of the copper production and a profit additional. Some mines commonly spoken of as copper mines, are really gold mines or silver mines.

THE question of mine taxation is an ever present one and a fruitful topic for discussion. British Columbia is making present effort to evade or abrogate the crushing burden of taxation. With mistaken zeal in the race for revenue, tax gatherers often treat tax creators unjustly, and tend to destroy some good sources. Recently this paper, in the course of some homely suggestions, said that a U. S. patent was of ironclad potency in mine titles, and that in case of a desired sale the possession of a U. S. patent to the property was always a help. In the usual letters subsequently received from various mining points, the idea was plainly brought out that while all conceded the value of a U. S. patent should a sale be desired, yet in many instances the owner of a mining claim deferred securing a U. S. patent to his property because of an inevitable increase in tax rate thereon in his locality as soon as the patent was secured. Regarding the point brought out in the editorial referred to, that the tax valuation of \$100 on unpatented mining claims in the United States was arbitrary and unwarranted, statement comes

from more than one California county that even on an unpatented claim the owner sometimes hesitates to sink a shaft to prospect because the prospecting hole is taxed what it costs to sink it. It is ridiculous that money paid to labor should be taxed to the man who employs labor. It is manifest even to a county assessor that a mine's value is not to be fairly determined by what it costs to prospect it. As a matter of business, the expense of improving, developing, opening up a mine, should be exempt from taxation. Miners don't object to taxation, but they do rightly object to be made special subjects for the taxgatherer. The matter has intimate connection with preliminary making of a mine, and is one of the things that sometimes tend to keep back the creation of wealth and greater opportunity for taxation in districts now undeveloped.

Replacement of Machinery.

Mention has been made in the last few months of the rapid advance in mining and scientific matters that often make books thereon somewhat behind the times when issued from the press. This rapid advance has also the commercial effect of rapid and enormous depreciation in the value of a comparatively new plant. In several notable instances the right kind of economy has dictated relegating to the junk shop a lot of costly machinery. But a few months ago, according to an electrical contemporary, "the New York Telephone Co. calmly and deliberately dumped \$400,000 worth of telephone apparatus into the scrap heap and started at Cortlandt street a new exchange in place of the old one, in order to increase the efficiency of its service. The salvage from the old hoard and the old subscribers' equipment is far too small to be mentioned. The equipment is still in sound working order, and is replaced simply because a better system has been invented. At the time the old switchboard was huilt it was the largest metallic circuit multiple switchboard in the world, and was equipped for 6000 lines."

This is a notable case in point. Another fell under the writer's personal observation during a recent visit to Pittsburg, where in one establishment he saw \$300,000 worth of fine machinery thrown out, just because the owners knew of better machinery that would make money sufficiently faster to justify the apparent recklessness. The idea now is to work a machine to death, for the likelihood is that long before it is worn out some better device will be substituted, and if a concern does not keep up with its competitors it must go to the wall. 'Tis a daring race, and one that requires nerve to sit steady.

In mining—particularly in gold mining—such need of extravagant economy does not exist in so marked a degree, yet even in the domain of mining and metallurgy a comparison of a catalogue of 1882, 1892 and 1902 shows how ancient some former mining appliances now appear.

"Standardizing" Catalogues.

In the issue of August 16th appeared an editorial paragraph on the suggested "standardization" of catalogues as to size, setting forth some reasons for the idea, and recommending that 6x9 inches be chosen by progressive machinery manufacturers and dealers. In the issue of August 21st of Engineering News the leading editorial is devoted to the same suggestion, and one paragraph therefrom is deemed worthy of reproduction. Our Eastern contemporary, in recommending the 6x9-inch size, says: "When a firm has invested thousands of dollars, more or less, in publishing a catalogue, it is manifestly for its interest to have that catalogue made use of by its customers and not thrown away or stowed in some obscure corner where it will be forgotten. Yet when such a firm permits the manager of its publication department, or its printer, or whoever has charge of the matter, to make a catalogue of some odd size, perhaps too high to stand on an ordinary shelf or of greater width than height, so that it refuses to go with others in a proper classification—when it commits such a piece of folly, it is deliberately consigning a large percentage of these expensive catalogues to the waste-basket or to the top shelf where they will be forgotten."

Concentrates.

IN Colorado a prospector is debarred from entering upon a patented placer claim with intent to find a lode.

At a temperature of 50° F., a cubic foot of compressed air on the surface of the earth will weigh 536 grains.

THE 83rd meeting of the American Institute of Mining Engineers will be held at New Haven, Conn., beginning Oct. 14, 1902.

By way of variety, the hoary term "fissure vein" might be styled an "ore break," the latter being further defined as "a break in the rock, accompanied by ore."

It is manifestly impossible to correctly quote current values of rare earths. So much depends on attendant circumstances. Didymium is worth about \$7 per ounce, cerium \$7.50, lanthanum \$40.

It has been calculated that since 1870 the cost of gold production in general has fallen 60%. Meanwhile the refined product is still worth what it was when it cost twice as much to mine gold as it does now.

THERE is no such distance as a "knot." The distance between two "knots" on a logline is 6082 feet. The term "knot" is correctly used only in connection with time; a mile is a mile, regardless of anything else.

THE present United States tariff levies a duty of 12½% on cyanide of potassium. The ordinary duty on chemical salts is 25%. Some of the imported article is far from pure, being a mixture of potassium and sodium cyanides.

"CONCENTRATES" does not know of any authenticated case where only a part of the charge of giant powder in the hole exploded, leaving a part of the same charge unexploded, and which was subsequently set off.

TO PREPARE resin for soldering bright tin, mix 1½ pounds of olive oil, 1½ pounds of tallow and 12 ounces of pulverized resin, and let them boil up. When this mixture has become cool add 1½ pints of water saturated with pulverized sal-ammoniac, stirring constantly.

ORDINARY dynamite is made up of 75% nitro-glycerine, 25% infusorial earth; duallene contains 80% nitro-glycerine, 20% nitro-cellulose; rend-rock has 40% nitro-glycerine, 4½% nitrate of potash, 13% cellulose, 7% paraffine; giant powder, 36% nitro-glycerine, 48% nitrate of potash, 8% sulphur, 8% resin or charcoal.

IN the case of Smith vs. Jones et al., as reported in 60 Pac. Rep., Utah, 1104, it was held that the surface of mineral lands may be owned by one person and the mineral underneath by another, each with an indefeasible title, and that, when so owned, they constitute separate corporeal ownership, and the surface land might be partitioned the same as where there is no mineral under it.

"QUARTATION," referred to in the issue of Aug. 2, is a term used by assayers in acid parting of gold and silver. It was originally thought that the proper proportion for parting was three parts silver to one of gold; hence the name "quartation" given to the process. Experience has shown, however, that a lesser proportion of silver is quite as effective, and that the copper may be considered as silver for parting purposes.

THE mean effective pressure and the average pressure shown by an indicator diagram are never the same, and never can be except in the case of a condensing engine in the exhaust pipe of which there is a perfect vacuum, and that has never been attained. It is doubtful if it would pay to run an engine under such conditions, for the same reason that it does not pay to run a non-condensing automatic engine with a very short cut off.

ACCIDENTS to miners from picking out mined shots might be greatly obviated by not filling to the brim with tamping. It should not be necessary to pick out any holes if loaded in this way: Tamp in first powder put in moderately with a stick; then put in a cap and fuse; put balance of powder on cap and tamp lightly. If an upper use a little paper on top of all. The tendency of giant is down and out, not down and up. Holes thus loaded will break to the bottom and as well as when filled to the brim with tamping.

THE Canadian Dominion Government authorizes the payment of bounties on lead refined in Canada from materials produced in Canadian smelters from Canadian lead ore. On every ton of lead so refined during the calendar year 1902, \$5; on every ton of lead so refined during 1903, \$4; on every ton of lead so refined during 1904, \$3; on every ton of lead so refined during 1905, \$2; on every ton of lead so refined during 1906, \$1; the bounties payable half-yearly on the first days of July and January in each year; the total sum payable for such bounties not to exceed \$100,000 in any year.

IF gold and copper are melted together in any proportion and thoroughly mixed while fluid, the resulting bar or ingot will be uniform throughout in composition. But when silver is alloyed with copper only one proportion is known which will give a uniform casting. This proportion is 72% silver to 28% copper. With more silver than 72% the center of a cast bar will be richer than the outside, which chills first; while with a less percentage than 72% the center of the bar will be poorer and the outside richer than the average. This characteristic of silver-copper alloys is known to metallurgists as "segregation."

THE successful treatment of gold and silver ore by the cyanide process depends entirely upon the nature of the ore itself. Very satisfactory results have been obtained by coarse crushing without concentrating of ores with the values contained in the oxidized iron pyrites. It is doubtful if the ore will yield to successful treatment in raw condition if the sulphides are not in their natural state. A careful examination of the ore and tests would be the only way of treating each specific case. If the ore contained in excess of 1% of copper or any antimonial sulphides, or zinc, it would not be profitable to attempt the cyanide process for the extraction of the precious metals.

To remove rust from polished steel cyanide of potash is excellent. Soak, if possible, the instrument to be cleaned in a solution of cyanide of potassium in the proportion of one ounce of cyanide to four ounces water. Allow this to act till all loose rust is removed, and then polish with cyanide soap. The latter is made as follows: Potassium cyanide, precipitated chalk, white castile soap. Make a saturated solution of the cyanide and add chalk sufficient to make a creamy paste. Add the soap cut in fine shavings and thoroughly incorporate in a mortar. When the mixture is stiff cease to add the soap. It should be remembered that potassium cyanide is a virulent poison.

IF the owner of a mine contracts with the owner of an adjoining claim to extend its workings into such claim, for a stipulated price, for the purpose of exploiting and developing the property, and it be agreed that, should any marketable ore be taken therefrom in the course of such development, the first mentioned would sell the same and account to the second mentioned for the proceeds; the first mentioned is not prohibited by such contract from claiming the proceeds of ore so removed and sold as his own, where, in making the development, he discovered that the vein from which he took such ore had its apex within the lines of his own claim, and the ore was, therefore, his own property.

SILVER alloys with bismuth in all proportions, and the latter metal may even be employed instead of lead for cupellation, though the process is then much slower, and the loss of silver is ordinarily greater than when lead is used. The affinity of zinc for silver is so great that the former metal at a temperature a little above its melting point will remove silver from its alloy with lead. When silver is plunged into mercury there is produced at the surface of the metal a very thin layer of amalgam, which arrests the ulterior action of the mercury. This is the reason why grinding is so necessary in the amalgamation of silver ores, because the adherent film of amalgam is removed by friction, and fresh surfaces of silver are exposed to the mercury.

THE Wetherill magnetic separator has been applied successfully at Kalk-A-Rhein, Germany, in the separation of an ore containing galena, zinc, blende and spathic iron, carrying 12% of manganese, with a gangue of quartz. By ordinary mechanical concentration there could only be obtained an impure spathic iron, containing 15% to 22% of zinc and about 2½% of quartz. Using the Wetherill separator, the ore being crushed not to exceed 3 millimeters diameter, the blende concentrates showed 42% to 46% zinc, and the spathic iron, obtained as a separate product, carried only 1% to 3% of zinc. The tension of the current was 65 volts, with 12 amperes. Each machine, with belts 14 inches wide, traveling 125 feet per second, was capable of treating a little over one ton per hour, at a cost of 29 cents per ton.

REGARDING the use of charcoal in the cyanide process, it had been found that the finely divided particles of charcoal passed through the filter and the solution became injuriously affected for future use. The difficulty was subsequently overcome by placing upon the perforated bottom of the tank holding the solution a thick canvas cloth held in position by a flat iron ring closely fitting the angle formed by the bottom and side of the tank and this ring secured in its place by lugs and keys or screws, the tank having a double bottom and the space between the false and true bottoms being partially exhausted by an air pump, this mode tending to cause a steady and easily regulated flow of the solution through the canvas, but preventing the passage of the fine charcoal particles which remain in the tank on the canvas. The same result is reported effected, preferably, by placing a tightly fitting cover on the tank and forcing air in the space between the surface of the solution and the cover.

AT Rossland, B. C., to transport the ore from the main shaft to the shipping bins at the railroad, the War Eagle employs a double track gravity tram. This tram is set for nearly its whole length on a trestle, not to save grading, but to escape the snowfall. The tram has a fall of 350 feet in a total length of 1300 feet, and in profile has a concave and convex curve. The rope is kept down on the concave side by a pulley in an overhead frame, and kept up on the convex curve by a sheave of 4 feet diameter set between the tracks. The tram car holds five tons of ore, and is dumped automatically at the lower end of the tram. This end of the tramway is movable, and can be so swung that the end is over the bin into which the ore should be dumped. The tramway at the Le Rol is an aerial one, about 2000 feet long. One man only is employed at the loading end. At the other end the buckets drop their ore into the bins automatically. From the bins the ore runs into the cars below through iron chutes, the gates of which are worked by compressed air cylinders.

IF leaks develop in gaskets the bolts holding same should be tightened; if in seams or rivets, so that the water squirts out, the pressure should be dropped to not exceed 50 pounds for high pressure boilers or 25 pounds for tubular boilers, and then the bad places calked with the proper tools. It will do no hurt and is even safer to let the pressure off almost entirely before calking, and this is especially desirable if there are several leaks or continuous leaks in seams. It should never be attempted to calk a boiler under full water pressure, as the boiler is then under heavy strain, and, being full of water, is especially rigid, and a sharp blow may start serious leaks in several places at once. Raise the pressure again, watching the seams as before, and repeat the operation until the pressure is raised to about 50% above the regular steam pressure at which it is to operate, without having any metal-to-metal joints running or squirting water. A small seep or sweat is allowable, as these places will close up as soon as the boiler is heated. All this is really the business of the boiler erector; but sometimes the engineer in charge is supposed to do all this himself.

THERE are two methods of refining platinum ore. One is known as the Wollaston. In this, after removal of the metals associated with platinum by the successive action of nitric and hydrochloric acids, the platinum itself is dissolved in aqua regia, from which it is precipitated by a solution of sal ammoniac in the form of a sparingly soluble double salt (ammonium platino-chloride). This salt is washed and heated to redness, by which the chlorine and ammonia are expelled, leaving the metal in the form of a gray spongy soft mass, known to chemists as spongy platinum. In this form platinum can not be fused into a compact form by ordinary furnace heat, but, like iron, it can be welded at a high temperature. Accordingly, it is made into a thin paste with water, then introduced into a brass mold and subjected to a graduated pressure, by which the water is squeezed out and the mass rendered sufficiently firm to bear handling. It is then dried, very carefully heated to whiteness and hammered or subjected to powerful pressure. The Deville-Debray method: This is a very simple furnace. Two flat pieces of quicklime are scooped out, representing two cupels, and form the bottom and the lid of the furnace. The lower cupel has a notch cut in its side to serve as an exit for the liquefied platinum. The upper one is pierced at its center with a slightly conical round hole, through which the platinum nozzle of an oxyhydrogen blowpipe enters, so that the flame beats down on the metal within.

EXHAUST STEAM when at atmospheric pressure has a temperature of 212° F., and yields its latent heat upon being condensed. Open heaters using exhaust steam are capable of raising the temperature of the feed water to about 200° when properly proportioned to the work, besides removing a considerable amount of the impurities in the water before it enters the boiler, which prevents the formation of scale to a greater or less extent, principally the heavier but softer formations. The heat in the gases escaping to the chimney may be utilized in what are known as economizers. These are nests of pipes arranged close together in the smoke flue between the boiler and the chimney. The smoke and hot gases pass between and around the pipes while the feed water is forced through them before entering the boiler, thus abstracting a large percentage of the total number of heat units in the gases which would otherwise be wasted. The feed water should enter the economizer at a point farthest from the boiler, or where the hot gases enter the economizer. It then flows through the pipes in the opposite direction to the current of hot water, and consequently comes in contact with the hottest gases just before entering the boiler, and at this point the temperature will be found to be above 212°, or the boiling point at atmospheric pressure. If the feed water is first heated in a closed exhaust steam heater before it enters the economizer it is possible to raise the temperature nearly to that of the steam in the boiler when under considerable pressure.

TO GRIND a stop cock of any kind, first see that the plug fits the barrel before it is taken from the lathe. Run a half-round smooth file up and down the barrel to break any rings that may be in it; a few rubs of a smooth file back and forth over the plug will break any rings or tool marks on it. Wipe both parts clean. Use for grinding material fine molders' sand sifted through a fine sieve. Mix with water, in a cup, and apply a small quantity to the parts that bear the hardest. Turn rapidly, pressing gently every few turns; if the work is large and the lathe is used, run slowly; press and pull back rapidly to prevent sticking and ringing; apply grinding sand and water until a bearing shows on another part, then use no more new sand, but spread the old that has worked out over the whole surface. Turn rapidly, pressing gently while turning; withdraw the plug and wipe part of the dirt off, and rub on the place a little brown soap; moisten with water and press the surfaces together with all the force at hand, turning at the same time. Remove the plug and wipe both parts clean; next try the condition of the bearing by pressing the dry surfaces together with great force. If the parts have been kept together closely while grinding, and the plug has not rubbed against the lower part of the barrel, the surfaces will be found bright all over and a perfect bearing obtained. If an iron barrel and brass plug are used, or two kinds of brass, a hard and soft metal, soap should be used freely when finishing up, as the tendency to form rings is greater when two different metals are used.

Treatment of Slimes by Filter Presses.*

By CLEMENT DIXON.

A filter press consists of a number of hollow frames (from 30 to 50 in a six-ton press according to depth of chambers used) placed alternately between solid flanged plates, with filter cloths of strong duck material between each. The hollow frames—in a six-ton press—would be 3 feet 6 inches or 4 feet square inside and 2, 3 or 4 inches in depth or thickness, as required for the particular ore treated. It will thus be seen that in reality we have a number of little vats standing on end—the hollow frames forming the sides and the solid plates and filter cloths the bottoms. Each of the hollow frames (which receive the slimes) is connected by a slot with the slimes inlet passage, and every alternate solid plate is connected by a slot with the wash solution inlet passage; these solid flanged plates act as filter bottoms for admitting wash solutions to the slimes cakes. The remaining solid plates are connected with the wash solution outlet passage, and serve to carry away the wash solution after it has passed through the slimes cakes. Again, on each of the solid flanged plates is a cock used for draining the press when filling same with slimes. In establishing the filter press on a slimes works, the first and most important detail is to determine by experiments what thickness of slimes cakes to make, or, in other words, what is the best depth to have your hollow frames so as to ensure that your cakes will be uniformly permeable to wash solutions; this thickness, of course, depends on the nature of the ore and fineness of crushing, etc. Probably a 3-inch cake will not be found too thick for the majority of slimes on these fields.

One six-ton press will hold six tons dry slimes and about three tons moisture, and as the press could be re-charged, say every two hours, it will be seen that each machine (of this size) has a capacity of from sixty to seventy tons of dry slimes in twenty-four hours. There are two principal methods of dealing with slimes in filter presses—(1) The slimes (separated from the sands by means of spitzlütten and afterwards settled in V boxes and settling vats) are agitated with weak cyanide solution of the required strength, and as soon as the solution of gold is complete (commercially) the pulp is forced into the presses to separate the gold-bearing solution from the slimes; then weak wash solution or water is forced through the cakes to displace the remaining gold-bearing solution. (2) The solution of the gold may be effected entirely in the filter presses (without previous agitation with KCy solution) by first charging the press with slimes and then forcing cyanide solution through the slimes cakes until the highest commercial extraction of the gold is obtained, then displace gold solution by weak wash or water. Both these methods are in use in Western Australia, but the choice must be determined here, as elsewhere, by experiment. No. 1 method is the one adopted, with every success, by the largest reduction works in New Zealand.

If No. 1 method were adopted, the process would be conducted as follows: As in the decantation process, it is essential to separate as much water as possible from the slimes in order to reduce the bulk of solution, ergo consumption of KCy, to a minimum. The thick pulp is then transferred from the settling vat by means of a pump or by gravitation, if possible, to agitators, and sufficient weak cyanide solution added to bring the proportion of solution up to 1.5 to 1 of dry slimes. After the solution of the gold is complete (commercially) the slimes are run into a small pneumatic forcing receiver, and by means of compressed air, supplied from an accumulator at, say, seventy pounds pressure—a steady flow of pulp is forced into the hollow chambers of the press. During the process of filling, the gold-bearing solution escapes from cocks along one side of the press into a launder and flows into an intermediate gold solution vat and from thence into the precipitation boxes. As soon as the press is full of slimes these leaching cocks (of the press) stop running. The cocks are then closed and wash water or weak wash solution is forced into the press at the inlet plates—at, say, from 90 to 100 pounds pressure—and pushing the remaining gold solution out of the cakes, escapes by the outlet plates into a launder conveying it to the gold solution vat over the precipitation boxes.

As the washing process is one of "displacement" it will be readily understood that it is practically absolute and the residue slimes will contain only gold that has not been brought into a state of solution. This is a point that will appeal to many on the Rand whose trouble in treating slimes by the decantation process has not been so much getting the gold into solution as getting it out of the solution afterwards—it has not been a chemical difficulty in fact, but merely a mechanical or commercial one. As soon as the slimes cakes are sufficiently washed, the press is unscrewed and the frames or leaves pulled apart and the residue slimes cakes are dropped into trucks below and sent away to the dump.

With ordinary care and attention to details and assuming that the necessary conditions for success, as I have endeavored to briefly sketch them, have been complied with, I think it will be found that treating, say, 4 dwts. to 4½ dwts. slimes on the Rand, a uniformly good extraction of say 90% may be obtained at a minimum expenditure of cyanide solution. The probable cost of labor to run agitators and presses here to treat same capacity of slimes as now being treated by a slimes decantation plant will be, say, 1s. per ton of dry slime, and filter cloths for the presses may pan out at another 2d. a ton of slime treated. These figures, of course, are only approximate and are based on the working costs of presses on other gold fields.

Need of Good Roads.

The general public is now very largely in favor of good roads, if they can be obtained by some method of taxation that will be just and equitable. This country has been raising millions of dollars' road taxes and spreading it over highways so thin that there has been no perceptible improvement for a century, except in a few States. Proper legislation has proven the one thing needful to take the stream of wasted taxes and turn it into hard, smooth, permanent highways; hence, as I said in the beginning, proper legislation is now the most important division of the road problem.

STATE LAWS.—Long before any other State, in 1891, New Jersey passed a most comprehensive, successful and just road law. Its principles have been copied by most of the States having any pretension to a system of progressive, permanent road building. In brief, the Massachusetts law provides for three highway commissioners who have full charge of spending the road funds. A community desiring to improve its roads petitions the authorities, who refer it to the State engineer, who examines it and reports to the commissioners as to whether it is practicable to build or not. The commissioners proceed according to this report, as far as they have funds, in the order of date of petitions. The State pays the entire cost. Massachusetts has spent an average of \$600,000 a year for several years in building permanent highways. The law also provides that only a limited number of miles can be built in any county during the year.

Connecticut has also been active in permanent road building of late, appropriating from \$400,000 to \$500,000 each year. In that State the town pays one-half and the State one-half.

Rhode Island has a law that gives the highway commissioners the power to build in each town a half mile of sample permanent road, but has no other State aid.

California has highway commissioners, the result of a strong effort about ten years ago to formulate a good road law. These commissioners are allowed no funds except \$31,000 a year to defray expenses. Their work is entirely instructive.

Indiana has a law which is accomplishing a good work. It provides that, on petition, the commissioners may order an election to determine whether a new road shall be built and the county can issue bonds or levy a special tax to pay for it. Minnesota has a law similar to Indiana.

The New York legislation is nearer like that of New Jersey than any of the other States. While the New York Legislature was discussing this subject, they appointed themselves a committee of the whole and visited the good roads of New Jersey to inspect them and view the working of the first State aid road law. Outside of the above-mentioned States, legislation has done little for the betterment of our roads. In a number of States, including California, there are laws providing for the use of convict labor for improving roads or crushing stone for them.

THE NEW JERSEY LAW.—The summary of the New Jersey law is as follows: Upon petition of two-thirds of the properties on a public highway at least a mile long, the county board shall proceed to construct such road, after having advertised for bids, upon specifications approved by the State authorities, provided that in one year the amount shall not exceed 1% of the tax levied for that year—the cost to be paid, 10% by the property owners along the road, 33½% by the State and 56½% by the county. The New York law differs in some minor details, and in that the State pays 50%, the abutting property owners 15% and the county 35%. Both these States have petitions filed asking for road improvements far beyond the appropriations every year. A great advantage in the New Jersey law is that the people have the say as to what roads shall be improved, if they are willing to pay a just proportion of the cost as well as their regular taxes. They are not everlastingly paying road taxes without seeing any real good accomplished. Another advantage under this law is that for every dollar spent there is a permanent gain. Under the present system, or lack of system, in most of the States, we could go on forever, and the last year before the judgment day we would still be hauling our produce through mud or dust. Several of the counties of New Jersey have now practically all their roads in a condition that is almost perfection. To build these roads the counties were bonded. After three years' experience with the improved roads, it was found that

the people were paying less taxes for roads than ever before—that is, the tax levied for interest on bonds, sinking fund to pay off bonds, and for repairs on roads, was considerably less than the road tax for patching up old roads had been, not mentioning the comfort, the pleasure, the increased value of property, the hauling of loads for two-thirds the former cost.

Topographic Survey of Northern and Central California.

Under the general direction of R. U. Goode topographic work is being prosecuted by the U. S. Geological Survey in various localities in California during the present field season. In the northern part of the State a special map is being made of the Keswick mineral region, including an area of about 30 square miles. A portion of this area is included in the Government map of the Redding quadrangle, which has been recently surveyed on the scale of about 2 miles to the inch. The special map will be on the scale of about 1 mile to 3 inches, the large scale being necessary to a proper study of the geologic questions involved in this important district. The party engaged in this work is in charge of A. B. Searle.

In the central portion of the State two parties are operating. One is in charge of R. B. Marshall, with G. R. Davis and L. D. Ryus as assistants. The party will complete the survey of the Kaiser Peak quadrangle, which includes the upper portion of the San Joaquin river.

The second party in central California is in charge of E. T. Perkins. Principal assistants are A. I. Oliver and W. V. Hardy. This party will survey the section in the vicinity of Kaweah and Three Rivers, an area of nearly 1000 square miles, including the headwaters of the principal tributaries of the Tulare river.

Triangulation in Western Montana Forest Reserve Completed.

A preliminary report from R. H. Chapman, topographer, indicates the progress of the work of triangulation in western Montana, in the Lewis and Clarke and Flathead forest reserves, later to be followed by topographic mapping. In this report the completion of triangulation in the Lewis and Clarke reserve is announced. This forest reserve was created in 1897, and has an area of 4572 square miles. It occupies the crest of the Rocky mountain range for its entire width in northwestern Montana, in one of its most rugged portions, some of the peaks reaching an altitude of over 10,000 feet.

The plans for this season's work include the extension of triangulation over the western part of the Flathead forest reserve and across the Kootenai river, embracing the area between this stream and the eastern Idaho line which has been proposed as a timber reserve; the work is then to be connected with the monuments marking the Canadian boundary, and with the triangulation stations near the Idaho line which depend upon a base measured near Spokane, thus affording a check upon the accuracy of the work. Another check-base has been measured near Kalispel, and will be connected with the main system through the necessary stations.

A Decade of Mineral and Mining Returns.

The division of mining and mineral resources of the United States Geological Survey, under Dr. D. T. Day, has recently issued a chart showing the quantity and value of the mineral productions of the United States for the ten years ending with 1901, which will be widely sought because of its convenience for reference purposes. Without attempting an analysis of the statistics presented, it is noticeable that the value of the total output of metallic ores, such as iron, copper, gold, silver, etc., was in 1901 \$524,873,284, against \$307,936,189 in 1892; and that the value of the non-metallic products, including coal, petroleum, natural gas, building materials, etc., was \$566,351,096 in 1901, against \$339,958,842 in 1892.

From the compact arrangement of the metallic and non-metallic resources on a single sheet, it is possible to follow the yearly change in the production of about sixty of the important mineral products of the during the country decade. The chart, to be had on application to the Director of the United States Geological Survey, is issued in advance of the report, "Mineral Resources of the United States, 1901," which will be ready for distribution in the fall.

Notable Electrical Progress.

From San Jose, Cal., under date of August 30, the following is received:

"Last night every single electric light in this city drew its origin from the long distance power station of the Standard Electric Company, 153 miles away, in the heart of the Sierra Nevadas. Over these miles of aluminum wire, strung on high masts, there was harnessed and carried a force that moved the street car lines of the city, the printing presses, the powerful machinery of manufactories, and even the delicate manipulation of the dentists' instruments for drilling teeth. It was the first time in the history of any city that its entire electric power was borrowed from a source so far away."

* Condensed from Journal Chemical and Metallurgical Society.

The Eames Motorette.

The accompanying illustration shows a simple and practical run-about vehicle weighing less than 100 pounds, adapted to carry a person weighing 200 pounds, at from 5 to 10 miles per hour. This motorette is operated by a gasoline engine of 1½ H. P., driving a hall-bearing counter-shaft that in turn drives the two large wheels of the machine. The transmission is all by means of belts, making it

importations were added to the supply. The result was an extraordinary accumulation of the red metal in the hands of leading interests. For a while co-operation between the principal producers was tried, and, when this failed, coercion was attempted by the breaking of the market toward the close of the year. This was preceded by a very serious decline in the shares of copper companies on both sides of the Atlantic.

The total product of domestic copper in the United States in 1901 was 268,782 long tons, as against 270,588 long tons in 1900. The amounts produced and the relative percentages of the total production of Lake Superior, Montana and Arizona were as follows:

Lake Superior, 69,772 long tons, percentage of total production, 25.9; Montana, 102,621 long tons, percentage 38.2; Arizona, 58,383 long tons, percentage 21.7. Mr. Kirchhoff discusses at some length the conditions and productions of the mines in the Lake Superior district, in Montana, in Arizona, in Utah, and in Tennessee.

The total imports of copper in the United States in 1901, from all sources and in all forms, amounted to 124,938,323 pounds, as compared with 103,895,026 pounds in 1900, with 93,172,191 pounds in 1899, and with 50,268,499 pounds in 1898.

The total value of the exports of copper from the United States in 1901 was \$36,071,448, as compared with \$58,875,439 in 1900, with \$43,485,654 in 1899, and with \$35,545,251 in 1898. Germany is by far our largest customer for copper, since the greater part of the metal shipped to the Netherlands is in transit for that country; on the other hand, some of the copper which goes to the United Kingdom is shipped from there to other countries. The details of these movements cannot well be followed.

The estimated consumption of copper in the United States in 1901 was 382,761,014 pounds, as against 356,891,121 pounds in 1900.

The stock of copper on hand in the United States on January 1, 1902, is estimated as being at least 300,000,000 pounds, equivalent to six months' production. In the absence of figures which might be said to represent normal years, it is impos-

sible to do more than make a guess at what might be considered the excess over a reasonable stock. It is probably fair to assume that, even at the beginning of the year 1901, the stocks of copper in this country

Effect of Oil Fuel on Boilers.

In reporting on the effect of petroleum on boilers when used as fuel, F. C. Bitgood, boiler inspector for a steam boiler inspection and insurance company, says that when oil fuel was first taken up the inspectors were told to note its effect on the boilers. Thus far scrutiny has failed to reveal any bad effects, where proper care was exercised. It was found that in case of too great concentration of the oil flame upon certain parts, tubes were bent and shellplates overheated. Some apprehension was felt at first that the amount of sulphur contained in the crude oil might cause rapid deterioration from pitting and corrosion, but no extraordinary pitting of tubes and shells have been noted since the introduction of oil as fuel. This may be accounted for by the fact that the amount of sulphur liberated per thousand heat units is less with oil than with coal.

The wear and tear upon the boiler structure is reported to be less with oil than with coal. Much of the wear and tear with coal is due to the strains produced by the sudden and frequent rushes of cold air against the hot plates and heads while furnace doors are open for firing, resulting sometimes in leakage at tube ends and seams and small fractures of the boiler plates. These are avoided by using oil for fuel—the doors never opened, the temperature remaining practically even. In some cases where constant trouble had been experienced with coal, there was an improvement when oil was introduced.

Double Cupelling Furnace.

Herewith is illustrated a double English cupelling furnace, consisting of two removable reverberatory hearths which lead into a flue in common, each hearth, it will be observed, being heated by a separate fire box, the hearth being an iron frame—a test bottom—filled with a mixture of fireclay and pulverized limestone, the test bottom being supported on a car so that it can be readily removed and another bottom substituted in its place, pipes connected with a fan or blower conducting blast to the firebox and to the lead bath.

The fact that lead melted with free access of air is oxidized to litharge, while silver and gold (should any be present) remain unchanged, is used to advantage in separating gold and silver from lead and other base metals by cupellation, usually conducted in a reverberatory furnace, the oxidation of the lead being hastened by a blast of air made to play over its surface, the litharge being allowed to flow off as fast as formed, thus permitting a fresh surface of lead to be continually presented for oxidation. The operation is continued until all the lead has been converted into litharge and removed, the remaining contents of the hearth being a molten mass of refined silver or dore bullion. This operation may take several hours, fresh bars of argentiferous lead being added from time to time. The silver remaining in the test at

The Eames Motorette.

cleanly, noiseless and smooth running. The frame is steel tubing, and carries a nicely upholstered seat with a spring steel back, the seat resting on four coil springs, making a very easy riding vehicle.

The machine is fitted with a hand-propelling device, but with free running sprockets, so that the handles remain stationary except when used by the hands.

It is started from the seat by giving the handles a turn or two, then opening the throttle.

The guiding is done from the lever at the left side of the seat, and with this same lever is connected the brake, so that both can be operated by the one hand. The guiding wheel is also fitted with springs holding it in a straightforward position, so that it will run straight ahead unless turned by the lever, thus doing away with liability of accident through disarrangement of the steering gear.

The capacity of the gasoline tank is ½ gallon, which will run the machine from 30 to 35 miles; cost 10 cents, or ½ of a cent per mile.

The electrical ignition is from four cells of dry battery, which will last from 500 to 1000 miles; cost 50 cents each, or \$2 per set.

The Eames Tricycle Co., 2018 Market street, San Francisco, are the builders, and are now designing a two-seated vehicle on similar lines, adding about 50 pounds to the weight, and with higher rate of speed.

Production of Copper.

The production of copper in 1901 is reported by Charles Kirchhoff in Mineral Resources of the United States, 1901, now in press, U. S. Geological Survey.

The conditions surrounding the copper-mining industry during the year 1901 were in many respects extraordinary. Production was only slightly less than it had been in 1899 and 1900, and consumption in this country was undoubtedly considerably greater. But a determined effort was made during the greater part of the year to maintain values in the face of adverse conditions in the countries which are the principal customers for our large surplus. Prices were kept above the parity of Europe, so that large

Double English Cupelling Furnace.

were beyond the working limit. The copper market opened in 1901 rather dull at the official prices of 17 cents for Lake and 16½ cents for electrolytic, but actual sales were made at 16½ cents for Lake, and at 16½ cents for electrolytic. By the 13th of January, 1902, the official prices had fallen to 11½ cents for Lake copper. The world's production of copper in 1901 was 511,803 long tons, as against 487,206 tons in 1900, 463,693 tons in 1899, and 429,379 tons in 1898.

By far the most important of the new mines which have entered the world's market in recent years is that of the Greene Consolidated Copper Co., whose properties are located at Cananea, Sonora, Mexico. There is every reason to believe that, before the close of the current year, the production of this company will reach 4,500,000 to 5,000,000 pounds of fine copper per month. Such a rapid development has never before been witnessed in the copper-mining industry.

the conclusion of the operation may amount to several thousand ounces.

In a lead refinery where there is much lead to be cupelled, the silver-lead bars from the retorts are first concentrated by cupelling off a large percentage of the lead in a large water-jacketed cupel furnace, the rich silver-lead thus obtained being afterward completely cupelled in a smaller cupel furnace. The cupel furnace is sometimes used for extracting silver and gold from lead bullion obtained from the blast furnace, the litharge being afterward reduced with coke in the blast furnace. In leaching works, where silver is extracted from the ore by sodium hyposulphite and precipitated as sulphide, the best method for refining the sulphide is to cupel it with lead, fine silver bars being the resultant product.

The cupelling furnace here illustrated and described is made by the Allis-Chalmers Co., Chicago.

Road Grades.

Written for the MINING AND SCIENTIFIC PRESS by C. H. FITCH.

The saying is attributed to an Indian: "It is easier to walk than to run, easier to stand than to walk, easier to sit than to stand, easier to lie down than to sit down." So he lay down. In building mountain roads grade is the necessary evil, and the chief thing is to have the roads lie down and rear as little as possible.

In one of the Engineering News' prize essays on road building, the principle is laid down that there should be no reverse grades. An even minimum grade is specified between two points of elevation. This is a good illustration of theoretical engineering proceeding by axioms and incurring great expense to obtain a small advantage. It is true that in going from one point to a higher point in a given time the least power is required on an even grade provided that speed be uniform. If grades were variable, however, and speed slackened on the higher grades, no more power might be required.

Practically roads follow the contour of the country up hill and down dale, and the lifting power is distributed over such a time of travel as not to be serious. The easement coming down also offsets the labor going up a reasonable grade.

The principle that there shall be no reverse grades is not of importance and it can only be realized in most cases by excessive costs of cutting and filling. The better plan is to take every advantage that nature affords, and follow the contour of the country with no more change than necessary to soften grades to a comfortable point.

But there is another argument than that of cheapness of construction in favor of light variable grades. They are easier on man and beast. I once took an object lesson on this very point at the expense of the State of Connecticut. Surveying the park surrounding the statehouse at Hartford, I laid out a walk up the 90-foot hill on which that building stands. It was a geometrical curve in plan, and the center line was a perfectly true grade from top to bottom. It was laid in asphalt and I was prepared to take pride in it, but for some months I was obliged to take my own medicine, and traverse that path several times a day. It was the most tiresome walk for its length I ever knew, and I have climbed mountains until it seemed as though I would be paralyzed with exhaustion going up and telescope all my joints in coming down. In the summer following came Frederick Law Olmsted, landscape gardener, under whose orders the walk was torn out and different approaches made.

The anatomical reason alike in man or beast is that of the fatigue of muscles which are obliged to repeat the same motion many times without variation. In such repetition a strong man may exhaust himself in no long time, though the load lifted be no more than a feather. Even a level is more tiresome than light variable grades.

It is desirable to meet difficulties singly. One of the first tales read by a boy in Latin is that of the combat between the Horatii and the Curatii, three brothers on a side. Two of the Horatii had fallen, leaving one to contend against three, but the sole survivor contriving to meet his opponents one at a time slew them all. A grade is a disadvantage, increasing the pull. A sharp curve is a disadvantage, because the leading horses can only give an oblique pull, and the heaviest pull of all comes on one wheel horse. Hence a curve on a grade reduces the capacity of the road by two deductions at one point. Abbott says that this principle is not generally understood, or is ignored. Yet upon such a curve the roadbed is usually widened. This gives opportunity to relieve the sharpness of curve by sidling across the road. With a given grade "winding" the road helps the grade, reducing its steepness by elongation.

I once remarked of a crooked road that it appeared to have been originally surveyed by a cow. I have since formed the opinion that there are worse surveyors than cows. The cow follows the easiest lines; the human road builder often takes a stiff, straight rule for both plan and grade, making great labor and cost of construction and no corresponding gain in comfort of use. These things are wearisome to think about and the mind travels as well as the muscles of the legs. Cities laid out like checkerboards and turnpikes which mock the imagination by seeming changeless and eternal are things of weariness forever.

The legs of a horse are like those of a man in wearying under the same kind of effort on a uniform grade. A horse in starting a load or overcoming a stiff grade will exert much more effort than usual for a short time. A pair of ruts on a level road the distance apart of axles will make an obstacle much worse than a 12% grade, and in getting out of them the direction of pull is unfavorable, not being parallel with the grade, not a lifting pull but one which tends to force the wheels down and against the obstacle.

There is not much lost in up and down or reverse grades if the heavy grades be lightened to the 8% limit and stepped by level intervals. When we follow

the lay of the land as far as possible without excessive grade we reduce expense materially over the cost of a stiff even-grade straight-line road, which requires much more cutting and filling. The sinuous curve helps the grade, and power is now so readily available at light expense, and it takes so little power to elevate a load slowly, that a power lift might be arranged to overcome a stiff transition from lower to higher country, saving a larger expense in road building.

In softening grades a cut costs less than a fill, as the fill requires a widely spread base, and work of placing and solidifying as well as removal. The cut is more subject to slides and snow drifts. There is opportunity for thought in avoiding the formation of drifts. A drift forms where carrying power of wind slacks by being retarded by resistances, and especially where the current rises. Abrupt breaks and rough surface immediately above the road, and elevations formed by cuts on the down-mountain side, are drift formers. A narrow cut clears itself, and a wind cut is a relief to the road. A depression into which the wind eddies, and rising discharges its white freight, cannot be prevented from filling up.

When we have a high ascent to be gained we do not lay out a grade slope for a man to climb. We build stairs, and in all the work of ascent the man continually stands upon a level. If he requires rest he has a stable position, and does not tend to slide back down hill. The step clinches every rise and enables him to maintain himself at any height gained. Even quadrupeds can mount stairs with some facility. College boys for a prank have driven a cow up into a heltry, but it was not so easy to get her down again. Stepped grades in roads are, however, comparatively easy to ascend and descend. In these refinements the skin or surface hardness of a road is all important. It is important anyway. If one pair of wheels is on a grade and the other pair on a level, and the load is evenly distributed between the axles, only half the load requires to be pulled up the steep grade at a time. Even a low vertical obstruction may be passed by one pair of wheels with a horizontal pull on the other pair to roll them up.

Some machines like animals move by impulses. An engine driving a saw through a log, a butterfly valve being opened to meet the resistance with all the pressure there is, affords an example. So I have seen a traction engine that would rear up and get over fair sized logs. But I do not approve of such uses. We should be gentle with both machines and flesh, and strain neither unduly, as we hope for good service and light repairs.

Forethought smooths the way first in making the road and second in using it. Some teamsters no doubt look ahead, but most of us in roads of every kind let the ruts find us instead of going ahead to judgment in passing the ruts.

Utilizing Water Flow.

At the Ontario mine, Utah, a tunnel was begun at the foot of shaft No. 2, at the 1500-foot level. It required six years of difficult work, with many mishaps from excessive flows of water, to complete this work. The tunnel was entirely through rock, about 3 miles long, and cost in the neighborhood of \$500,000, complete. The large amount and continuous flow of water through this tunnel led to the idea of using this otherwise wasted energy. A plant was determined upon to utilize this water to light the mine and furnish power for the shops of the mine.

The plant is driven by a 3-foot water wheel, which is estimated to deliver to the main belt 80 H. P. at 280 revolutions under an effective head of 120 feet. The dynamo is an eight-pole 60 K. W. monocy-

clerator, driven at 900 revolutions by a 12-inch belt from the pulley on the wheel shaft. The length of the line of transmission is 6½ miles over a rough and broken country, 9000 feet above the sea level. The loss in transmission at full load is estimated to be 11%. This plant supplies light to 700 lamps of 16 C. P. at 110 volts and also drives three motors, two of 15 H. P. and one of 25 H. P. Two engineers are employed to run the Ontario electric system, each of whom runs the plant twelve hours daily. No labor is involved, owing to the steadiness of the load both day and night, the attention required in the power house being limited to the inspection of oil in the various bearings and the starting and stopping of the plant at the beginning and end of each run, at which time the machinery is wiped off. The entire system at any instant involves only the attendance of the engineer at the power house, who also makes any slight repairs or alterations required from time to time throughout the distribution. The operating expenses, therefore, include only the engineer's pay, occasional repairs and lamp renewals. It is estimated that the saving in oil and fuel by the use of this plant is \$3000 per year.

Some Main Requirements.

In concluding a detailed account of hoisting and haulage in mine operations, a description of the plant on the Le Roi mine, Rossland, B. C., Bernard MacDonald says:

The data collected in this paper show that for effecting the highest economy in mining operations where a large output can be maintained, the following equipment and facilities should be provided:

1. An efficient and up-to-date system of hoisting and haulage.
2. Such associated incidental facilities as will ensure, as nearly as may be, the continuous operation of every unit of the plant comprising the system.
3. Intermediate storages of ample capacity for ore, in the mine and between the different sections of the plant, to provide against the stopping of the entire plant if an accident to any one of the units occur.
4. Separate sets of hoisting compartments for the ore, and for the general traffic of the mine, the skips or cages of each set to be run in counterbalance.
5. All loading from the main storage bins to be done through chutes opened and closed by compressed air.
6. Where hand sorting of ore is advisable, it is to be done on traveling tables of steel or rubber passing before the sorters at a speed not exceeding 45 feet per minute.
7. The waste and second grade ore to be picked out and dropped into bins underneath the sorting floor, the sorted ore to be allowed to be conveyed and delivered to the sampling machinery automatically.
8. The boiler plant to be installed not nearer than 200 feet to any of the other units of the system and at a point, if possible, where the delivery and storage of a reasonable quantity of whatever fuel is used can best be effected.
9. A convenient grouping arrangement of the various units of the surface plant adjacent to the entrance of the mine, which should be accessible by railway, or by an easy system of wagon roads.
10. An efficient system of fire protection operating preferably by gravity, or a combination of gravity and pumping. If the latter is used, sufficient tank storage should be provided, so that, in case of fire breaking out, water under sufficient pressure will be available at once while the pumps are being started.

Current Required by Motors.

200	1474	737	324	818	409	180	940	470	208

This table gives the current taken, at full load, by various sizes of electric motors for direct and alternating current at the ordinary pressures of 110, 220 and 500 volts. The current taken by direct current motors depends upon the efficiency, and with alternating current motors it also depends upon the power factor. These qualities vary somewhat in motors of different make, so the above values must be considered as fair averages. They are useful in making wiring calculations, fixing sizes of fuses, etc. The current given for two-phase motors is the full-load current taken in each phase; the current for the three-phase motors is the current in each of the three line wires.—Science and Industry.

Examining Mines.

Written for the MINING AND SCIENTIFIC PRESS
by J. B. BALCOMB.

The first requisite of a man who examines mining property is absolute honesty—not so much to be honest with the property, but to be honest with himself, to his own better judgment. This will be elaborated a little farther on.

The next requisite is good judgment. Many a man has wrecked his own fortune or squandered the money of another, not because he did not know enough, but because he was lacking in that fundamental characteristic of being able to tell which of the two propositions is the better, and how great chances it pays to take in the individual case.

The third requisite of success is experience. The advantageous use of intelligent experience is without doubt the most necessary requisite of all, but it is impossible without the previous characteristics.

The last requisite, but by no means to be slighted because it is placed last, is technical training. The great reason why practical men of affairs place so little confidence in the so-called mining expert just graduated from college is because, in his mind, the above order is reversed. He considers the fact of his having thorough technical training as *prima facie* evidence of his being a competent mining engineer. The worst of it is that this view of the case, which has been forming itself during his university work, prevents him from assuming the right attitude when he undertakes field work. He goes into the field with geological names galore at his tongue's end, fondly imagining that they are the open sesame to success. We do not in the slightest depreciate the value of these, but we do wish to emphasize the fact that these acquirements are not first in importance.

Now let us amplify the above thoughts. By saying that a man should be honest is not meant merely that he report things exactly as he finds them, nor is it included in the statement that he should report everything he finds, more than is necessary; he must know that he finds everything there is to be found. Above all, he must not allow himself to be deceived into thinking that things exist otherwise than they do. He must not only be able to tell black from white, but he must keep his hopes and desires in the matter in abeyance—that the black will still seem black, even though it destroys the hopes of the would-be purchaser.

By good judgment is meant that happy faculty of weighing two facts under the conditions as found and ascertaining their comparative importance. Sometimes there seem to be a large number of facts that need to be compared at once. Right here is where many men fail in judgment. They try to compare a large number of facts at the same time. This is impossible. Nowhere does good judgment manifest itself more surely than in its ability to select the two things which need comparing first and in ascertaining their relative merits. When one of these has been disposed of, the other should be compared with a third, and so one by one a conclusion will be reached in regard to all of the facts bearing on the question. To illustrate: He should not try to compare in his mind at one and the same time the favorable and unfavorable geological conditions, the desirable and the undesirable physical conditions, the different kinds of reduction processes which might be applicable to the ore, the different more or less feasible plans of marketing the products, and the many things each of which requires to be weighed and determined separately. Another thing: It is unnecessary to consider what process is adapted to the ore until it has been determined that the ore is of sufficient commercial value to be treated by some process. Also, he should not allow himself to multiply the gross value of the ore by the number of tons per day which some imaginary reduction works would treat, and so arrive at an hypothetical gross daily revenue. This is always misleading, dangerous and unnecessary. By so doing a man puts himself in the wrong frame of mind, as well as accomplishing nothing useful. After agreeing to examine a mine, the first thing necessary is to get general information about the property. If there are any maps, field notes or descriptions to be had, it is well to assimilate these before even going on the ground. Also, if any geological data concerning the section of country under consideration can be secured, it is well to examine it carefully. A man thereby often saves mistakes and most assuredly gets himself to thinking along lines which he will have to follow in examining the property.

When he is on the ground he should still seek general impressions as to the lay of the land, the character of the location and the points at which abrupt changes occur; notice the general formation of the country, and especially the drainage system; see what are the main geological conditions, both on the property and the surrounding mines; make a note of what improvements there are in the way of buildings, roads, reduction works and water supply.

After gaining all of this information, the man is ready for a detailed examination of the property from a geological and metallurgical point of view. At this point it is generally best to examine the surface con-

ditions first. If there are any dikes which have a well marked outcrop, study physical and mineral characteristics. The same may be said of the country rock. With this general and particular information which nature has kindly volunteered, the engineer is ready to go down the shaft or in the tunnel. The underground work deals almost exclusively with details, and not with general impressions. While frequent samples should be taken from the surface, in the underground examination sampling is of prime importance. If there are no faults, the character of the walls will probably remain fairly uniform, and sampling at regular intervals will answer every purpose. If the ore is fairly uniform in character, it may be sampled at regular intervals, in each case noting the width of the vein. If the character of the ore is different in different parts of the vein, the extent and value of each portion must be carefully sampled, so that the value of each may be determined in the laboratory. In the case of faulting, the location and character of faults must be determined with precision.

The dip of the vein can be determined with great exactness in shafts and fairly well in tunnels. On the other hand, the strike can be determined with great exactness—except in magnetic ores—in tunnels, while but little can be done in shafts.

The objects of a mine examination are manyfold, the following being among the prominent ones: First, to determine the value of the ore; second, to determine its character; third, to determine the amount of ore "in sight" and the "probable" ore blocked out; fourth, to determine the probable cost of mining and transporting it to the surface; fifth, to determine the best method of reduction; sixth, to determine the natural advantages and disadvantages; seventh, to determine gross outlay and net revenue.

It is almost needless to say, when samples are once taken, they should be jealously guarded, so that there is no possibility of "salting." The samples in the laboratory should be handled systematically, so that there will be no possibility of ascribing wrong values to portions of the vein. So far as possible, opinions and judgments should not be formed until all values are determined. The next question to be considered is the manner of making deductions and arriving at conclusions after all this data is at hand. Following that comes the manner of arranging reports so as to make them clear and concise, yet full and attractive.

Arid Lands of the United States.

In view of the new law for the reclamation of arid lands by using funds from sale of public lands for their own development, to which we have previously alluded, a description of the arid region and its relation to the other regions of the country is pertinent. Such will be found in the report of the Geological Survey when it shall be printed, and of which we have secured an outline for immediate use.

The arid regions of the United States include about two-fifths of its entire area, and extend from about the middle of the continent westward nearly to the Pacific ocean. A broad intermediate sub-arid or sub-humid belt, near the center of the United States, extends over North Dakota, South Dakota, western Nebraska, western Kansas, and into Oklahoma and the panhandle of Texas. In very wet years the sub-humid region creeps up to the foothills of the Rocky mountains. During dry years the greater part of the plains region west of the Missouri becomes semi-arid. Arid regions are those in which the average annual rainfall is 20 inches or less. Large tracts of Canada and Mexico, as well as of the United States, and a great part of the countries of the old world, are, according to our standard, arid. Irrigation was the basis of the agriculture and, therefore, of the civilization of many of the ancient peoples, a fact of much significance to us.

WHY THEY ARE ARID.—If the surface of the globe were flat the rains would probably be distributed uniformly in broad bands parallel to the equator. But the uniform movement of the atmosphere is interfered with by lofty mountain masses. In the United States as a whole the general movement of the atmosphere is from west to east. The damp winds from the Pacific deposit their moisture on the high masses of the Sierra Nevada in the winter and on the Rocky mountains in the summer, leaving the broad lower plains lying east of each great mountain mass dry, sterile and desert-like. Thus the mountain ranges are well watered, while the lowlands are parched with drouth. These arid lands are, however, covered with a more or less scanty vegetation, only a small per cent being true desert lands, such as the Utah desert, west of the Great Salt Lake, and the Mohave desert, in southern California, near the Colorado river.

THE VACANT LANDS.—One-third of the United States, exclusive of Alaska and outlying possessions, consists of vacant public lands. These lands lie for the most part in the arid region, and crops cannot be produced upon them, nor settlers take them up for homesteads, until a sufficient supply of water has been obtained. Then crops are abundant. It is for the interest of the public at large to have all of these

good agricultural lands utilized. Who shall make their occupation by settlers possible? The answer must come from the lawmakers of the country, and they must be in possession of the facts in order to act intelligently. The laws governing the disposal of the public lands have been drawn almost wholly with reference to the lands of the Ohio and the Mississippi valleys, with their sufficient rainfall. This rectangular system of subdivision of the public lands has been found detrimental to the best growth of the western two-fifths of the United States, because attention has been concentrated upon land titles, whereas first thought should have been given to water rights, through which alone the land has value. To remedy this evil for the remaining public lands, and to gather the facts upon which intelligent action can be based, is patriotic duty. These facts pertain first of all to the water supply and its limitations.

THE FORESTS.—The forests of the arid region mark the greatest rainfall and also the sources of the streams. In obedience to public sentiment the Government has already set aside many millions of acres of forest and woodland, primarily for the supposed beneficial influence of forests upon stream flow. The open grazing lands of the arid West have had and still have their history of conflicts between the interests and the persons of the settlers, the cattlemen, the sheepmen and the lumbermen. So uncertain are the conditions surrounding the use of the public lands for grazing purposes that practically all of the farmers and the irrigators of the arid region, as well as the stockmen, ask for legislation by which temporary rights in the form of licenses can be had to the use of the forage, pending final settlement of the lands. As it is now, the ranges are frequently so overstocked that the valuable forage plants are eaten down and destroyed. This matter of grazing in the West, being of fundamental concern in the arid region, is constantly brought before the hydrographer, and it has an intimate relation to the development of irrigation and the complete utilization of the water resources of the public domain.

THE DESERTS.—Some of the actual desert lands in the United States produce nothing, even when watered, as, for example, the broad flats adjacent to the Great Salt Lake in Utah and the lands around the Humboldt, Carson and Walker sinks in Nevada. Others, like the Mohave desert, near the Colorado river, in southeastern California, produce large crops when watered. Portions of these desert lands, therefore, are reclaimable by artesian wells or by reservoirs for storing the intermittent floods of the small streams flowing from the bordering mountains. It is most important that thorough geologic examinations should ascertain the practicability of obtaining water by deep wells, and that such examinations should be verified by drilling a few wells to a depth sufficient to determine for a large desert area whether an artesian flow can be surely obtained.

A Utah Sampling Works.

The Park City Sampling Mills, estate of R. Mac-Intosh, are putting up a 500-ton sampling mill. The building is 44x65 feet by 70 feet high, equipped with rock breaker, four sets rolls, five samplers, 16x36 Corliss engine, two 150 H. P. hoilers equipped with automatic stokers. The plant for a long time has been worked under the old method of quartering down, then taking the quarter, crushing it up and sampling that down. By the new method (this mill is being built right on to the old mill) everything will be sampled. Everything will be delivered from the cars right to the crusher and pass through the crusher. From the crusher everything will be elevated to the top floor and all pass through samplers of the larger type. There will be a 25% cut made and the 75% rejection will go to the shipping elevator and be delivered to the shipping bins, where it will be loaded directly into cars as fast as sampled. The 25% which was cut out by the sampler will pass through a 36x12-inch high-grade rolls and be reduced from 1½-inch to ¾-inch in size. This 25% will then be elevated and pass through a second sampler, where another 25% cut will be made, the rejected going to the shipping elevator and the sample to the second set of 30x10-inch rolls. This process is repeated four times, each successive cut being 25%, and passing each time through a set of rolls to be again passed through a sampler. Out of a 250-ton lot the final sample of 600 pounds is delivered into duplicate bins over the sample grinder reduced to eight mesh. From these bins it is drawn off into the sample grinder and prepared for the assay office. The mill will be automatic throughout and will be a great saving in labor, thorough and accurate in its work. The mill will be lighted by electricity throughout and heated by steam. The plant was designed and erected by J. B. Fleming of Park City, and is under the management of C. Read, and the supervision of same will be under T. W. Hayt, who is at present in charge of the sampling works. They will also have two 100-ton Fairbanks railroad track scales. The scales are equipped with automatic registering beams. They expect to have the mill in operation in sixty days.

Park City, Utah, Sept. 1.

The Recovery of Arsenic From Ores and Metallurgical By-Products.

The elimination and recovery of arsenic from lead ores—frequently smelted by lead smelters—merits considerable attention by metallurgists, both from a sanitary and an economic point of view, no metallurgical system entailing waste, which can be saved with appropriate means at any profit at all, being perfect.

Arsenic, a constituent encountered in most lead ores, is an undesirable element in blast furnace smelting for many reasons, viz.:

1. It is very poisonous, workmen suffering greatly from its gases.
2. It causes loss in smelting by volatilization.
3. In great quantities present it forms speise, thus increasing consumption of iron flux.
4. The speise formed shortens smelting campaigns, sows being formed readily.
5. It increases fuel consumption, a less readily fusible slag being desirable, as speise is liable to chill the crucible contents.

In roasting arsenical ores in an oxidizing atmosphere, the arsenious acid, a volatile solid, is eliminated at a moderate heat—arsenious acid or arsenic

furnaces, heated by producer gas. Each furnace is connected with flues 250 meters long.

The arsenious acid nearest the furnace, being of a grayish color, is resublimed, that farther away sold as a marketable product or worked into white glass. (Preussische Zeitschrift, Vol. 18, page 199; Dr. A. Schertel, Mineral Industry, Vol. 9; C. Schnabel, Metallhüttenkunde, Vol. 2, page 503.)

As flue dust, soot and carbonaceous matter are detrimental to white arsenic, impairing its purity and reducing it to metal, the flue dust (ore) is roasted in reverberatory furnaces heated by gaseous fuel, f. i., by producer gas, generated by coke.

A furnace suitable to roast the flue dust is shown in Figs. 1 and 2. The furnace is heated by producer gas (generator not in figure) to secure a pure sublimation product. The flue dust is shoveled onto the hearth; through openings a, c, are working doors, d are openings in the hearth to drop the roasted flue dust into cars, which run on rails under the archways, A. The gases pass off through the flue, F, provided with two dampers, d1 and d2. When the furnace is charged, and at the periodical rabbling, the damper d2 is closed to avoid any ore particles being carried into the condensing chambers; in the meanwhile, damper d1 is opened and the gases pass through a stack, S, into the air. As shown in Fig. 3, two furnaces form a couple, their flues combining into one main canal.

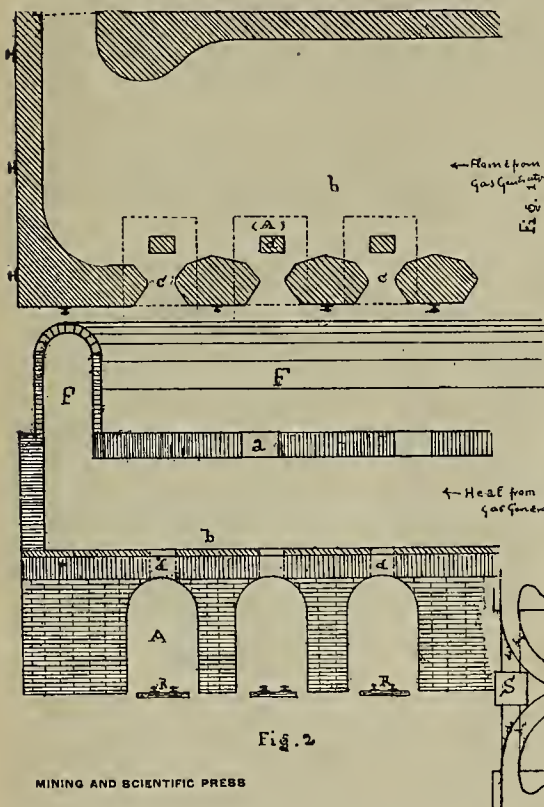

Fig. 2

Fig. 3.

trioxide sublimes at 200° C., but, contaminated with other elements, the roasting temperature has to be heightened—and when condensed in chambers of lower temperature is obtained as a white powder, the white arsenic of commerce. As any sulphur present is burned to sulphurous acid and sulphuric acid anhydride, both volatile gases, we have means to save the arsenic as well as the sulphur in one roasting operation. The arsenic is condensed, while the sulphur gases, after they passed the arsenic condensing chambers, are completely oxidized by a nitric oxide generator and manufactured into sulphuric acid by the chamber process.

A roasting furnace, embodying and combining the above features, has been designed by Serjeant & Flude, the roaster proper, resembling the Brunton automatic roaster, is heated by hot air. The arsenious acid gas and the sulphurdioxide and sulphur trioxide pass the condensing chambers; the arsenious acid is deposited, the sulphur gases pass a nitric acid generator and then leaden chambers to be converted into sulphuric acid. This furnace will hardly be adopted in large lead plants, its capacity being too small, but has come into use in Australia to roast the arsenical and sulphide concentrates of gold mills. In large smelting plants the arsenic and sulphide ores are best roasted in the modern automatic roasters, which connect with long flues to collect the flue dust and arsenious acid. If the manufacture of sulphuric acid is aimed at, the sulphur gases are purified by filtering and led into acid chambers. The flue dust containing the arsenious acid is roasted in an oxidizing atmosphere in special furnaces, connected to long flue chambers, a length of 300 meters being not uncommon to encounter in the leading arsenic-producing districts of Devonshire and Cornwall, England. In Freiberg, Saxony, all the arsenious acid is collected with the flue dust, derived from roasted ores, and the flue dust is roasted in reverberatory

The white arsenic fumes are condensed in a canal, constructed as indicated in Fig. 4, a, b, c. The walls, w, and plates, d, are lead-lined and waterjacketed, the water entering jackets at d and f. At the top the jackets are bent and open to discharge the water at d4 over the roof of the canal; the roof is slightly inclined, the water running towards the rear end of the flue into a tank, to be used again. The sudden decrease in temperature makes the arsenious acid to drop readily, thus dispensing with very long condensing channels and diminishing the corroding effect of the arsenic on the lead, hot fumes being more detrimental and deleterious.

As seen from Fig. 4a, the bottom of the flue slopes at an angle of some 40° towards the front; this secures an easy removal of the white arsenic, which can be dropped through doors, D, directly into cars, running on rails, r, thus facilitating the work greatly, which is a disagreeable job at best.

The flue dust is now tolerably free from arsenic, and, briquetted, can be smelted in the blast furnace; besides that profit, an additional profit is gained from the arsenic, which can be sold either as white arsenic or white glass, if it has been worked into that article.

As most large smelting plants have roasters to recover the arsenic, it would but necessitate the additional expense for the erection of the reverberatories and the condensing canals. Considering the great sanitary and economic advantages gained by their adoption, prosperous and genial-conducted metallurgical establishments should not hesitate to make improvements in that line. Most of the appliances in Europe (Germany) for the recovery of poisonous gases were forced through by laws, prohibiting the conducting of gases, injurious to animal and vegetable life, into the air, and, owing to those laws, many metallurgical plants made profits not realized before.

Torreón, Mexico.

Torreón, Mexico

By-Products From Rand Cyanide Works.

The by-products that are obtained from the cyanide works, says Chas. Butters, are very much less in the case of fresh unoxidized ores than from acid or partly oxidized ores. Where the ores crushed have been exposed to atmospheric influences and are partly weathered the products of incomplete decomposition of the iron compounds always introduces a series of complications in the solution and precipitation of the gold that increases the amount of by-products, whether the gold so dissolved is precipitated by chemical or electrical agency. In the case of unweathered pyritic ore, or of perfectly oxidized ore, a solution is obtained comparatively free of iron salts, but in the case of a partially oxidized ore the ferrous and ferric salts produced, form, with cyanide and alkali, ferro-cyanides and ferrous and ferric hydrates. These diminish the efficiency, more especially of the chemical precipitating agency, and also increase the amount of sludge obtained from the electrical precipitation boxes. In the case of these acid ores a comparatively large amount of lime is needed, which, going into solution in the shape of hydrate, carbonate and sulphate of lime, crystallizes out in the zinc box and in the electrical precipitating box upon almost everything that it comes in contact with, more or less destroying the precipitating surfaces. This is a serious difficulty in the treatment of acid slimes. The surfaces of the lead cathode are almost completely covered after a few weeks by these comparatively insoluble lime salts which gradually slip off the lead surfaces. By carrying down gold they thus tend to enrich the precipitates in the bottom of the boxes, as well as the floating precipitates which pass through the boxes and out into the sump. In zinc precipitation everything that accumulates in the box in the way of slime is taken as the main cleanup. The particles which flow away from the box in mechanical suspension in the form of insoluble complex cyanides and hydrates, clayey matter, insoluble humus which has been precipitated from humic acid, and, in fact, any flocculent precipitates that may float through the box, will always carry gold along with them, which may be partly deposited in the sump. Hence one might properly say the only by-product produced directly from the zinc precipitation boxes, outside of the products resulting from the treatment of the zinc slimes, are the precipitates obtained from either the settlement of the precipitated liquors, or the precipitate obtained by filtration of all the liquids after passing through the zinc box. Under ordinary conditions, in a well-conducted cyanide works treating fresh ores, filtration of the precipitated solutions merely to obtain the floating matter from the zinc boxes would not pay, but where acid ores are treated, the precipitated sludge obtained from the sumps is of sufficient importance to warrant its careful collection. This precipitate varies in value from 1 up to 20 oz. to the ton. Precipitates so obtained from the Simmer and Jack cyanide works, where fresh pyritic ores have been treated, assayed 2 oz. 18 dwts. During the precipitation of rich solutions, running from 5 oz. to 8 oz. to the ton, flocculent precipitates assaying 14 oz. per ton, and composed of zinc cyanide and zinc ferro-cyanide, insoluble in the dilute liquor used, were carried over into the sumps. A skimming taken from the top of the treated tank partly mixed with exhausted residue gave an assay of 16 dwts. per ton, due mainly to finely divided precipitated gold which had been pumped back. Black skimmings of organic matter, resulting in the same way from the filtering through sand of precipitated liquors, gave an assay of 5 dwts. per ton. I consider it worth the attention of cyanide managers to see that the sumps are regularly cleaned of sludge, which may be dried by pouring into a small enclosure or dam made of tailings in the open air. After two or three weeks this material is dry enough to sample and assay, and in nearly every case will be found rich enough to sell to the smelting works. The gold in precipitates so obtained is not easily soluble in cyanide solutions unless special preparation is given to their proper oxidation, either by means of preliminary roasting or long-continued exposure to aeration and agitation with cyanide solution in an agitating vat.

ONE objection always urged against the use of induction motors of the squirrel-cage rotor type is their poor starting qualities. This is overcome in an interesting manner in the installation for pumping in the Horcajo mines, Spain. Each motor is connected to a high-pressure centrifugal pump, and three pumps, placed at different levels in the mine, are connected in series to overcome the hydraulic head of 1272 feet. In starting, one generator is run somewhat below normal speed. Then the first motor is thrown on an autotransformer and, after having come up to synchronism, is transferred to the generator and the second started on the autotransformer and so on. The motors start in this way at zero torque; and since, at the lower speed, they cannot overcome the hydraulic head, they absorb but little power. After all three are running, the generator is speeded up and delivery of water begins. It should be noted that, since the pumps are in series, all the motors run at the same speed and handle the same amount of water, all doing the same work irrespective of their vertical distances apart.—Electrical Review.

Save the Forests.

The two pictures on this page convey an impression which cannot be deepened by words. The beneficent gift of nature to many generations still to come is ruthlessly destroyed by the clumsy effort which this generation makes to secure its share. There could hardly be a more impressive picture of wastefulness. But while there is little to be said about the impressiveness of the contrast in the scenes, there is another side to the matter, and that is one of hopefulness. Forest preservation is gaining in the public mind. The great reservations which have been made will teach preservation by example. By example also is to be taught the lesson of securing the timber crop without destroying the forest and of utilization of the products of cutting without waste and without inviting ruinous fires by leaving the forest floor densely covered with inflammable material. Another hopeful sign is the resoluteness with which organizations in the interest of forest conservation and water storage are now working. One leading organization is the Water and Forest Association of California. Membership is held in all parts of the State, and the objects of the association should appeal to thousands not now enrolled. Full descriptions of the purposes and work of the society can be had by addressing the secretary, Mr. T. C. Friedlander, at the society's office in the Mills Building, San Francisco, Cal.

Cost of Mineral Surveys in Arizona.

First in getting a patent to a miner's claim is to obtain from the U. S. Surveyor-General an order for an official survey by a U. S. Deputy Mineral Surveyor. The cost of the work in the Surveyor-General's office is as follows:

which he receives a duplicate and triplicate certificate. The duplicate is sent to the Surveyor-General by the claimant, together with a certified copy of the location notice. The Surveyor-General transmits as a basis of survey this location notice to the deputy mineral surveyor named by the claimant to make the survey. This order gives the numerical number of the survey, by

The Surveyor-General always appoints enough good surveyors, U. S. deputy mineral surveyors, to prevent any one or a few men having a monopoly on this kind of work. In fact, the Surveyor-General never declines to appoint, on proper application, any good, competent surveyor of character a U. S. Deputy Mineral Surveyor.

Before entering upon the discharge

gets final receipt for a patent, after which it is not necessary to do any more annual assessment work on the claims.

CHALCOPYRITE has been reported more than once as an accidental product in metallurgical operations. Bornite, or peacock copper, on the other hand, has not been described as an accidental furnace product, nor as produced by sublimation. Both of these minerals are formed artificially at the smelter of the Butte & Boston Con. M. Co. at Butte, Mont. The minerals form slowly, attaining their maximum thickness of about 4 inches in the course of six months or a year, and render necessary the frequent replacement of the old rails by new ones. They form in the calciner, along the rails, in the bed of the furnace. They not only form beneath the flanges of the rails, but also slowly replace the rails themselves. When the rails are removed only a thin upper surface layer of iron remains; all the rest has been changed into chalcopryite and bornite, with the exception of that portion of the rails completely embedded in the brick bed of the furnace. There is no sharp line of demarcation between the remaining iron of the rail and the new minerals formed. Examination of these minerals shows that the one which is by far the more abundant is unquestionably chalcopryite; the other is in all probability hornite. An analysis of the former mineral shows an excess of iron; otherwise the mineral has the composition of pyrites of copper. Both minerals have been formed by sublimation, and not by fusion, since the temperature of the furnace never rises high enough to fuse the ores present.

With a Grain of Salt.

The Buffalo, N. Y., Courier of Sept. 1 says: "A combination of the mining companies, the total allied capital of which is \$7,500,000, has been formed, the arrangements having been completed in this city on Thursday last. Copper River M. Co. of Alaska, Green Consolidated Copper Co. of Arizona, Garretson Furnace Co. of Buffalo, Pittsburgh and Montana M. Co., of Montana, Garretson Southern Co., Suarahlipa M. Co. are members of the combine. The idea of the combination, it is stated, is to compete with the prominent existing copper companies in America."

Scene in the Same Forest After Wasteful Lumbering Operations.

For lode claims, each location, \$30.
For placer claims, each location, \$35.
For each millsite, \$30.

For each millsite included in one survey with a lode claim, \$15; should an amended order issue, an additional deposit will be required.

The applicant for mineral surveys deposits the above amounts with the nearest United States depository, for

which it is always known, and which number is marked on the corners by the deputy.

What the claimant pays the deputy whom he secures to make his survey, and names to the Surveyor-General, is a matter of private contract between the claimant and the deputy. Ten dollars a day is considered a fair compensation.

of his duties, a U. S. Deputy Mineral Surveyor gives a \$10,000 bond as a guarantee of the faithful performance of his official duties as a surveyor.

After obtaining the copy of the plat and transcript of the field notes of a mineral survey from the Surveyor-General, the claimant or mine owner takes them to the U. S. local land office, and, after the usual official routine,

Mining and Metallurgical Patents.

Patents Issued August 26, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

PROCESS OF PRODUCING STEEL DIRECT FROM OXIDE OF IRON ORE.—No. 707,638; D. Reynolds, Albany, N. Y.

Process of treating oxide of iron ores to produce therefrom wrought iron and steel, mixing granulated ore with sufficient granulated carbonaceous material to deoxidize ore and then duly carbonize iron in it, introducing and distributing this mixture in suitable furnace, subjecting this mixture in furnace to surface action of neutral heating-flame until oxide of iron is deoxidized and iron duly carbonized; introducing and distributing into furnace granulated fluxes suitable in character and amount to remove impurities, subjecting resultant mass to action of neutral heating-flame until metal is fused, separating slags therefrom, all in one furnace.

LUBRICATING APPARATUS FOR ENGINES.—No. 707,794; E. T. McKaig, Chicago, Ill.

In device of class described, combination with cylinder, of piston adapted to reciprocate therein, channel connected with cylinder adapted to receive supply of lubricant, wick extending into channel having other end in position to contact with piston, means for holding wick in channel.

DRILL SHAPER.—No. 707,584; D. Greenwalt and J. B. Dawson, Breckenridge, Colo.

In machine of class described, combination of suitable framework provided with vertical drill opening,

horizontal opening at lower end of vertical opening, bed plate slidable in horizontal opening, lug arranged in opening, arm hinged to bed plate, having notches interlocking with lug; knife slidable at angle with drill opening, means for actuating knife.

SMELTING FURNACE.—No. 707,601; C. Laughlin, St. Louis, Mo.

Smelting furnace comprising tuyere pipe, end plate thereof having inspection hole therein, end plate having downwardly converging lugs, and wedge-shaped plate fitting in lugs having hole adapted to register with inspection hole, plate being arranged to clamp, sheet of mica over inspection hole.

METHOD OF AMALGAMATING METALS.—No. 707,971; P. A. Knappe, Grantville, Ga.

Method of conducting continuous amalgamation of metals, which consists in causing passage of pulp through confined mercury-containing space, forcibly intermingling mercury and pulp by agitation of same, removing gangue from space, extracting heavier particles from gangue, causing heavier particles to be returned again into mercury-containing space, subjecting them to reintermingling with mercury therein.

PROCESS FOR EXTRACTING PRECIOUS METALS.—No. 707,926; W. Hilt, Coles, Cal., and C. E. Lane, Ashland, Or.

Process herein described, of extracting precious metals from solutions thereof, which consists in pro-

ducing cyanide solutions of metals, vaporizing metallic zinc by means of heat, conducting vapor thus formed to point beneath surfaces of solutions, producing finely divided zinc which replaces precious metals, thereby causing their precipitation.

AUTOMATIC STOP AND LOCK FOR OIL WELL CASING PERFORATORS.—No. 707,552; T. E. Clark, Visalia, Cal.

In an oil well tool of class described, combination of tubular body, vertically movable locking devices thereon, to engage casing and lock tool against descent therein; sleeve detachably connected to lower end of body, having inwardly extending flange at lower end; vertically movable plunger in sleeve; spring-pressed detent, carried by plunger, to engage flange and lock plunger in elevated position; yielding connection between plunger and locking devices, whereby latter are operated by plunger.

MINE CAR RAIL.—No. 707,999; J. A. Craig, Roscoe, Pa.

Rail joint comprising in combination with chair 9, having transverse slot 10 and upwardly projecting portion adapted to be held against under face of tread of rail, swinging plate 4, retaining pivotal bolt, free end of plate 4 being rounded and adapted to wedge against web of rail.

"Ancient River Channels."

The ancient river channels of California, from which so many hundred million dollars in gold have been taken and which contain so many thousand millions more, are not "rivers" in the ordinary sense. When these channels have been spoken of they have been called eocene, miocene and pliocene—"the dawn, the recent, the less recent and the more recent." These terms impress upon the mind the geologist's idea of time or epoch or period in the world's history. Some think this river system consisted of river channels in the ancient sea before the uplift of our continent; others that these great gold-bearing channels were rivers coursing north and south after the main chain appeared above the ancient sea; holding, of course, that gold was formed from some pre-existing rocks.

This great gravel bed and the channels and drifts run along the edge of the main mountain chain in a northerly and southerly direction with what appears to be numerous arms running almost due east and west, being crossed by the present river system in its course from the mountains to the sea.

Looking at the channel's course and then at the trend of the present rivers it is noted that they cross at almost right angles, cutting through and carrying away great areas of gravel deposited in various forms along their course, such as bars, benches, small channels, ravines and wide areas of deposit upon an uneven bedrock. Where the bedrock is slate the gravel is blue; hence, called the blue lead.

Where the bedrock is granite the gravel shows a reddish color, caused by the feldspar. The sloping nature of the land from the mountains to the sea averages about $7\frac{1}{2}^\circ$.

The overburden or cap is conglomerate cement or pudding stone. Near Deer Creek, Nevada Co., the covering is conglomerate, under which is a layer of pipe clay. At times this is crystallized; at other times, soft and tenacious as putty, under which are found seams of white gravel, streaks of red and blue, all of which are washed uneven in form, looking like sand on the ocean beach. The gold found in these lines is very fine; sometimes scarcely and often adhering to the soft granite bedrock.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

B. MacDonald, general manager Le Roi No. 2 and Rossland-Kootenay M. Cos., Rossland, B. C., gives an interesting outline of the operations on the Treadwell. Douglas Island is separated from the mainland by Gastineau channel, which is opposite the mines, three-fourths of a mile in width and 200 to 300 feet in depth. The general course of this channel is about east and west magnetic and the Treadwell vein runs along the coast roughly parallel to it. At the Treadwell mine the outcrop of the vein is about 1000 feet back from the shore and about 300 feet above high tide. Here the vein was 300 to 400 feet in width. It was mined by the open cut and pit system until recently, but now only about one-eighth of the ore mined on Douglas Island comes from surface pits. Some of the shafts and workings on the vein are now 400 or 500 feet beneath tide water, but the workings, nevertheless, may be considered dry. The ore is broken by machine drills, each of which averages from thirty to sixty tons per day. The excavations in the vein are not timbered, but are filled with the broken ore as the work of stoping continues. Only the swell of the ore, which amounts to about 30% of the total tonnage, is taken out while the stoping between any of the levels is in progress. The remaining 70%, which completely fills the stope and affords a solid working floor for the miners, is drawn off through shoots after the stoping of the back of ore levels has been completed. The walls of the exhausted areas of the vein are supported by vertical ribs and pillars of ore left standing while the levels are preserved by the horizontal pillars left over and under them. The horizontal pillar left on the tramming level is 10 to 15 feet thick, and through this pillar shoots are opened at convenient intervals. Through these shoots the broken ore is drawn off into the tramcars. The only timbers used are the mouthpieces of the shoots and the posts supporting them. Two-ton tramcars are used in the mine, and these are loaded at the shoots and made into trains which are hauled by horses on the endless rope system to the storage bins at the shaft. A horse hauls a train of six cars while a twenty-car train is hauled by the rope system. The shafts, with one exception, are vertical, and the hoisting is done by self dumping skips. Two large Gates crushers are installed at each shaft, which break the ore as it dumps from the skips into sizes suitable for the stamp batteries. When so crushed the ore falls into storage bins, from which it is hauled by train loads with locomotives to the stamp mills. Five thousand tons is thus delivered daily to the mills, of which 3000 tons come from the Treadwell mine, the balance being produced at three adjoining properties under the same management. The production is reduced during the dry or winter season. The ore is free milling and concentrating, carrying the gold free in the quartz and combined in the iron pyrites of which there is about 2% in the ore. The stamp mills are in units of various sizes, the two largest containing 300 and 240 stamps, respectively. For each five stamps there are two 6-foot Frue vanners. The stamp duty is five tons of ore crushed through slot screens equivalent to twenty-four mesh. The stamp drop is 8 inches, 100 times per minute. The tailings are allowed to run into a Gastineau channel. The concentrates, which are produced at the rate of 100 tons daily, are hauled on barges to the Tacoma smelter, where they are treated at a cost of about \$8 per ton for freight and treatment. The returning cargoes bring coal from the Vancouver island mines. The ore is very low grade, containing only about \$2 per ton. The average costs of treatment per ton of crude ore are as follows:

Mining expenses, which includes all development work.....	\$.8400
Milling expenses, which includes concentrating.....	.1840
Freight and treatment on concentrates.....	.1425
General expenses, which includes taxes.....	.0388
Total operating expenses.....	\$1.2053
New construction.....	.0775
Grand total.....	\$1.2828
Net profit (approximately).....	\$.7172

The taxes are \$3 per stamp head per annum, one-half of which is refunded to the city corporation of Treadwell. The total taxes, not counting the refund, are, therefore, about one-sixth of 1 cent per

ton of ore crushed, or, say, .008% on the gross value of the ore. Wages for Indian laborers are \$2 per day; for white machine miners from \$2.50 to \$3 and board. The steady miners have accumulated large bank accounts, \$4000 to \$5000 not being uncommon among many of the old employees. The mining, milling and business operations of the companies on Douglas Island are conducted with almost mechanical precision. There are always millions of tons of ore blocked out, and although very low grade the problem of mining and milling the ore and leaving a substantial profit is successfully solved.

At Rodman bay 100 men are at work; this number will be increased 50%. G. E. Bent, general manager, has a 10-drift compressor running, and the working tunnel is close to the ore body, the latter of quartz, lying in a contact of black slate and queenstone, 600 feet wide. It will be crosstied by the tunnel at a depth of 1000 feet. It was intended to erect 120 stamps. Mr. Bent has ordered sixty to be set up this fall, the remainder next year.

The Wild Goose M. Co.'s pumping plant on Snake river, Nome district, is in operation. There is a delivery of 4,500,000 gallons of water per day on top of Anvil mountain, 4 1/2 miles distant, at an elevation of 786 feet above the intake. It cost \$500,000. From the point of delivery the water is distributed in service pipes to the various works of the company.

The presidential proclamation of August 22d, creating a forest reserve of the Alexander archipelago, which comprises a long chain of islands skirting the southeastern coast of the territory, is severely criticised. Prince of Wales is the principal island of the archipelago. It is a great island, larger than some of the States of the Union. Mining men refer to Prince of Wales Island as having great mineral deposits, is rich in gold and copper, carrying also many other minerals of value. By the terms of the President's proclamation further mineral locations on this and all of the islands within the reserved territory are prohibited. Vested rights, however, are respected. The settler and mineral locator prior to the issuance of the proclamation are not affected where they comply with legal requirements. During the past four years capital, foreign and local, has been invested on Prince of Wales Island, locations made, and there are many trained prospectors on this island, searching for mineral deposits. All of these must leave. Anything they find, no matter how rich, cannot be located if the letter of the proclamation is enforced.

ARIZONA.

MARICOPA COUNTY.

At Phoenix is incorporated the Colorado River M. Co. of Arizona; E. Godchaux, J. and W. M. McGinty, I. W. Levy of California.

The Leviathan M. Co., near Phoenix, has an additional 100 feet in the incline shaft completed. Road making is in progress. When the 300-foot level is reached extra men will be put on to work the crosstied both ways.

Near Phoenix, Geo. Hamlin, at the Relief mine, has the shaft down 478 feet.

MOHAVE COUNTY.

T. Ewing has sold the Leland group of mines to O. A. Turner, of Nevada, and J. W. Woodside, of Philadelphia, for what is locally asserted to be half a million cash down. The new owners will make further development of the property at a cost of \$175,000. The new company will open up the Leland and build a double-track tunnel on the vein 3800 feet in length through the Leland mountain at a depth of 800 feet. Two mills are to be built, least capacity 400 tons. It is figured that the cost of milling and mining will not exceed \$3 a ton. There are three veins running through the nine locations that comprise the property, varying in width from 3 to 25 feet.

The smelter at Chloride is fifty tons capacity; the cost approximates \$40,000. A turbine steam blower, worked by a steam jet, has been ordered; there is also a continuous air box to go on an improved slot tyeure. J. D. Heard is superintendent; Thomas Neilson, assayer and metallurgist.

PIMA COUNTY.

A St. Louis dispatch of the 3rd says the Lincoln Copper M. Co. has sold its holdings to Chicago and Cleveland men, among whom are Mr. Worth of the Motor-Cycle Co. and J. D. Rockefeller. It is said the amount paid was \$1,000,000. The company owns mineral lands 30 miles south of Tucson. Besides copper, gold, silver and lead are found on the property.

PINAL COUNTY.

It is reported that the mines of the Mammoth-Collins Co. at Schultz are to resume Sept. 15, when men will begin driving a tunnel from the Mammoth mines to the Collins group at the 500-foot level. For this reason the 70-stamp mill at Mam-

moth, on the San Pedro river, 3 miles below Schultz, where the mines are located, can not resume until the workings are repaired and the tunnel driven to the Collins group.

SANTA CRUZ COUNTY.

D. S. Bryant, H. S. Methven and C. O. Foltz of Chicago are interested in the Arizona Hydraulic Co., working the placer deposits below Oro Blanco by means of hydraulic machinery; operations are on a large scale.

The Nogales Copper Co. has organized; J. W. Thomas, Phoenix; W. M. and A. E. Thomas and E. D. Brigham, Chicago, Ill.; C. N. Thomas and F. N. Cox, Nogales. C. N. Thomas will be general manager, the idea being to absorb the Buena Vista and Pena Blanca mining companies. F. N. Cox will be superintendent.

The Buena Vista copper mine, 12 miles from Nogales, is to be worked.

YAVAPAI COUNTY.

The worst storm in the history of Jerome occurred on the 27th ult., water depositing debris and boulders in the United Verde plant to the depth of from 8 inches to 2 feet. A 35-foot embankment on the Jerome railroad washed out. On the east side of Jerome, in Deception gulch, several thousand dollars' worth of mining machinery, including a hoist and air compressors belonging to G. W. Hull, was ruined. It is estimated that it will take 100 men two weeks to clear away the debris and put the plant of the United Verde Co. in the usual condition.

Near Mayer, on a spur of the P. & E. R. R., M. T. Boss is constructing an oil-burning smelter for the G. A. Treadwell M. Co. An upright smelter can not be used for oil, because, without coke to keep the ore from clogging, it would naturally settle down so closely as to shut off the hot air blast entirely. To avoid this, Mr. Boss has invented an almost horizontal furnace, into which the ore enters from above by a self-feeder, leaving air passages for the draft. A Pelton water wheel is to be installed, but water will be piped from Wolf creek with a fall of 1600 feet. The pipe line has been completed to within 3 miles.

Although it is not given out as coming from the head officials of the United Verde Copper Co., yet the declaration is made by those who are closely connected with these officials that the first of January, 1903, will not see the smelter blown in, says the Jerome News. The fact that there are now less than 150 men at work in smelter and mines, and that the ax continues to fall daily, would indicate that the shut-down would be for some months. The force at the mine and smelter will be reduced as fast as possible to seven men.

The T. F. Miller Co. has reduced its force about two-thirds, and those discharged are hunting employment elsewhere.

The Braganza Co.'s Henrietta mine and mill have seventy men employed. The mill is turning out enough gold to pay dividends and to meet payments for the property.

Townsend & Wright have a contract to sink 100 feet on the Verde King property.

While at Jerome, W. A. Clark ordered the rent of his tenants reduced one-half during the shut-down of the works. The News looks on this as another reason for the supposition that the works will not start up for some months, as the cut would hardly have been made if work was to be started in thirty days or thereabouts.

CALIFORNIA.

AMADOR COUNTY.

The Jackson Ledger says the Mitchell mine has a shoot of ore at the 200 level. Ten additional stamps will be started up soon.—The Horn M. Co. expect to be soon shipping ore for treatment.—Williams & Fisher have a contract to sink the shaft of the Edinburgh G. M. Co. A road is under construction to facilitate hauling machinery.

The Gwin mine will soon have 100 stamps in operation.

L. A. McRae has the Manzanita tunnel, near Volcano, retimbered. An upraise has been started to connect the Wheeler and Bradshaw shaft. Cramer Bros. have a mine under bond and are working it.

BUTTE COUNTY.

It is now stated that on the north fork of the Feather river, the mining of the bed of which a company has acquired by location 15 miles, work will be begun on a large scale. The properties lie between Big Bend and Delong mines and have been worked in a superficial way. Prospecting shows the bed to be rich. The railroad will be used to transport the gravel before washing to some available spot where trouble over the disposition of tailings will not arise. It is estimated that the dirt can be moved for 15 cents a cubic yard and will yield a large profit. The North California G. M. Co. is the name of the corporation, H. H. Yard of Philadel-

phia the active representative. The railroad will be narrow gauge.

The Bay Counties Power Co. has men working on French creek. The company proposes, in addition to the waters of French creek, to use the waters of the Little North Fork, Marble creek and Jordan creek. To reach these streams a tunnel 6000 feet in length will be constructed under the ridge near Junction House.

The North Cal. G. M. Co. is the company for which the North Fork surveys have been made. The project is the mining of several miles of the river bed. The company has acquired, by location and purchase, about 15 miles of the river bed, 8 miles of which is one unbroken stretch.

The plans of the company for working the river bed contemplate moving the gravels by rail before washing; to avoid trouble with the tailings. It is estimated that this can be done for about 15 cents a cubic yard.

It is the intention to run a level cut until bedrock is reached, then work up the stream, to cause the mine to drain itself and do away with pumping. The water taken out of the stream by the usual dam above the works is expected to become a part of the mine equipment by driving the machinery. Electric transmission will be used.

CALAVERAS COUNTY.

The S. P. O. & D. Co. of Boston has a bond upon the Lloyd placer mine, situated on Central hill, near San Andreas, and will develop the property.

J. C. Jens will start work on the Look-out mine, near San Andreas on which he holds a bond.

A strike of high-grade quartz is reported at the Iowa Con. mine, Rich gulch, 6 miles east of Mokelumne Hill. Some of the ore is asserted to be almost pure gold, held together by fine quartz seams. As nearly all the land around there is patented, there is but little chance to make locations.

EL DORADO COUNTY.

R. Smith, at Omo, has a tunnel to tap his quartz ledge 600 feet below the highest point on the surface. The ledge is 6 feet wide. The ore averages \$5 per ton.

HUMBOLDT COUNTY.

The machinery and supplies for the dredger and barges for the Gold Bluff mine are at Orick from Arcata. Men are setting up the machinery for the dredger.

INYO COUNTY.

A. Walker, who owns fourteen claims near Darwin, Inyo county, has bonded the property to British Columbia men for \$100,000. The ore is said to go 30% copper.

C. Anthony will start up his mine and mill at Balarat.—A full force is kept at work at the Radcliffe mine.—Thirty men are employed at Snows Canyon in getting in the new mill and machinery and development work will soon be resumed at Tuber.

LOS ANGELES COUNTY.

The Mining Review says Los Angeles is making preparations for a miners' convention to be held there next year. The convention will be representative of that southwest mining region, a territory vast and enriched with metals and minerals and fuel oils. A proper exhibit of them and the attendance of those contributing to the exhibit will prove of great interest and value to the mining industry.

The Cerro Colorado M. Co. has incorporated in Los Angeles; D. A. Moreno of Santa Ana, V. Peyton, W. F. Botsford, J. D. Pope, J. A. Haskett, A. L. Hawes of Los Angeles, J. Hanly of San Diego.

The Estelle M. Co. has been incorporated in Los Angeles; R. C. Troeger, E. H. Sweetser, C. E. Doheny, C. Wellborn of Los Angeles.

Reorganization of the Edison Electric Light Co., Los Angeles, is planned, merging the present Edison Co. with the Redlands Light & Power Co., Santa Ana Gas & Electric Co., Pasadena Electric Co. and other corporations. New funds will be used for the construction of a 20,000 H. P. electric water plant on Kern river, with transmission lines to and from Los Angeles, erection of a steam plant in Los Angeles for reserve purposes, and smaller plants on Mill creek and Santa Ana river.

MARIPOSA COUNTY.

The Mariposa says that at the Alice mine considerable ore is being taken out and will be milled at the Princeton mill. This mine is one of the grant properties leased by Merrilees & Champion.

The Long Mary is being worked under lease by Lord, Wills, Cathey & Northrup. The ore is being hauled to Princeton.

The Organita shaft has been sunk 140 feet and will be sunk 200 feet farther. The mill will be closed down and fitted up with modern machinery; R. Dodds superintendent.

At the Grimshaw mine, Hornitos, ore is being taken out.

NEVADA COUNTY.

At the Union blue gravel mine, North

Bloomfield, the tunnel is in 4300 feet. When about 450 feet more has been driven pay gravel is expected.

A 10-foot ledge is reported in the Zeibright mine at Bear valley, being developed by F. Zeitler and W. F. Englebright. Samples of the ore assays \$10 per ton.

The new 20-stamp mill on the Coe property, Grass Valley, will soon begin crushing. Superintendent O. B. Lakenan has 1000 tons of ore stoped out.

The North Bloomfield W. and M. Co. is building a flume $1\frac{1}{2}$ mile long to supply the Gaston Ridge, Plumbago, Union Blue and Malakoff mines with water. The flume at Camptonville is being repaired; 460 M. feet lumber will be used in the construction of the new flume, which will be 60 inches wide on the bottom and 44 inches high.

The Gold Blossom mine, Union hill, is hought by G. F. Dyer, general manager Lockport Lead M. Co., and has the Buckeye G. M. Co., Mariposa, where his company operates the Hite mine. He will equip the Gold Blossom with machinery to work the mine to depth.

The 10-stamp mill on the Pine Hill mine is finished. The mine is worked through a 400-foot tunnel. A 130-foot crosscut has opened up a ledge that will average \$11 a ton in gold. J. A. Robles, the superintendent, says he will soon have thirty men at work. Three concentrators are on the ground awaiting the starting of the new mill.

Manager Puscheck proposes to resume operations at his mine at Chicago Park when the ditch is completed. The 5-mile ditch from Bear river is $4\frac{1}{2}$ feet deep, 7 feet wide, carrying 2000 inches, sufficient power to run the 15-stamp mill, the compressor and all the machinery.

Near Grass Valley Superintendent Crellel will unwater the Union Hill mine with a 16-inch Cornish pump, 8-foot stroke. The company has an ore shoot in each of its drifts going west on the 250 and 350 levels. Samples from the 250 level go \$28 28; the 350 ore assayed \$13 50. The mine shaft is down 400 feet.

Grass Valley hears that sixty men are employed at Meadow Lake and that a 10-stamp mill is in operation.

The Grass Valley Con. M. Co.'s shaft is down to the 700-foot level; sinking 300 feet farther is in progress. A new compressor of 96 H. P. has been installed.

The Dillon mine, Washington district, has been bonded by G. W. Gacen and W. W. Stover of San Francisco, who will develop it.

The Frank M. Co. has incorporated at Nevada City; R. P. Rossen, C. O. Jepsen, G. A. Hurst, A. Hongell, E. J. Morgan. The main property of the company is the Frank mine, or Old Sailor Diggings, near Blue Tent.

The Elizabeth G. M. Co., in the Washington mining district, has incorporated; C. E. Thompson, L. T. Hacks, J. H. Duke, F. P. Howard.

The South Yuba Water Co. is building a large new dam at Bear Valley, of granite, 20 feet thick at the base and 40 feet high. Culbertson lake, above Graniteville, is being enlarged.

PLACER COUNTY.

The Johnson & Wright quartz mine, Auburn, has a shaft 210 feet deep. A 50-foot stope of free gold ore is opened. A 14-inch ledge at the foot of a 60-foot shaft in the Never Sweat mine, near Ophir, assays \$30 gold per ton.

PLUMAS COUNTY.

Work on what may be the third largest mining tunnel in the State is being pushed at Bellevue mine, near La Porte. The tunnel is 8x8 feet and is now in 3600 feet, with 2400 feet yet to go before gravel is reached. The tunnel will tap the old channel of the Thistle mine. Borings have proved the channel to be rich.

SAN BERNARDINO COUNTY.

Through a transaction involving a purchase price of \$500,000, C. H. Thompson of Spokane, Wash., has secured the mining property at Manvel, San Bernardino county, belonging to the estate of the late A. G. Campbell. Work will begin to put it in shape to meet the new conditions. It will be capitalized under the name of the Federal Mining Co.

The Woodstock M. Co., organized in San Bernardino, will operate near Cottonwood Switch. W. A. Liming is manager.

Lytle Creek Power Co. has organized in San Bernardino; H. T. Hays, S. B. Wright, C. L. Allison, J. L. Campbell, W. H. Miller.

SAN LUIS OBISPO COUNTY.

The Tar Spring ranch is sold to J. M. Clapp for \$55,000; \$5000 paid down, balance at the end of the year, contingent on success in the development of the oil. The sale, it is understood, is to be made to New York and Pennsylvania men. The ranch contains 4995.87 acres, less 185.25 already sold, 8 miles from Arroyo Grande. The terms of the contract make lessees

commence work and prospect continuously.

SHASTA COUNTY.

F. E. Ware, superintendent Mt. Shasta M. Co., was at DeLamar last week to oversee the reopening of works on the McClure group.

At Old Diggings the raise from the 200 to the 300-foot level of the Texas mine is finished. Ore was found worth \$200 a ton. The mine is lighted by electric lights and the compressor is run by electricity.

The Central mine is yielding good ore from the lower level. Miners are cleaning out the cave before running the level 300 feet ahead.

The Keystone mine, adjoining the Texas on the west, owned by E. White, is bonded for \$30,000 to Redding men. This mine differs from others in Old Diggings by having copper as well as gold and silver. Ore taken out in sinking two prospect shafts yielded $16\frac{1}{2}\%$ copper, in addition to \$3 to \$6 in gold and three ounces in silver. The ore averages \$14 a ton in value.

The Lanyan & Ben Hart group of five claims is under an \$8000 bond.

W. B. Newcomb has bonded the Little Wax mine.

B. F. Rogers, superintendent South Fork M. Co., has twenty-four men tunneling. He expects to reach the ledge in about 300 feet.

The Free Press reports Keswick lively, the company hiring all the men they can get and the railroad running full blast. The company is working five train crews. There are three ore trains on the hill to the mine and they make four trips daily, hauling low grade ore from the mine to Shasta depot; there it is dumped overhead until the time comes for it to be used.

SIERRA COUNTY.

The Empire mine, Gold valley, will be worked by Manager Buckley. The shaft will be sunk 600 feet, making a total depth of 1000 feet. Electricity will be the motive power.

At the Diadem mine, Forest City, C. A. Higby is sinking a new shaft in the lava to strike the vein on the serpentine contact. In the Oriental mine a long tunnel is being run by M. W. Mather.

W. L. Watts has a bond on the Colombo, or Bullion mine, near Sierra City. Mr. Watts is opening the old lower tunnel. As soon as the tunnel is put in repair and the ore body reached, he will build a mill and put in other mining machinery.

E. F. Harris of Alameda has a bond on the Alice and Papoose quartz mines. J. Schofield is in charge of the work.

SISKIYOU COUNTY.

Owners of the Punch creek quartz mine at Humbug have bonded the claim for \$30,000, to be closed within twenty days or no sale.

At the Wabana mine, Hornbrook, H. Mattern, manager, a 10-stamp mill is almost completed. It is the intention to use oil for fuel.

F. W. Mahler, superintendent Deadwood Hydraulic mine, has had a partial clean-up with satisfactory results. A water-power hoisting derrick and another giant is to be added; larger flumes will be added.

E. D. Baker has bought the quartz mine on Cherry creek recently sold to J. Ironsides; price, \$20,000.

The Yreka Journal hears that a Montana company has bought the copper mine of McVey & Co. at Joe creek, paying \$300,000 for it. This mine is locally considered to be more extensive than the Keswick or Iron Mountain mine in Shasta county; it is situated on the western side of Siskiyou mountain. To develop it thoroughly a railroad would have to be built for connection with the S. P. line.

Prospects for development of the copper deposits in the Siskiyou mountain are bright.

The dredger at Hawkinsville in Yreka creek has been started up again on the opposite side from former workings.

TRINITY COUNTY.

The Brown Bear mine at Deadwood, after a short shutdown to enable some repairs to be made, has resumed.

At Junction City the Cie Fse Co. is closed for the season and cleaning up is in progress.

The La Grange mine will close down for the season next week. A fifteen-day run last month is reported to have yielded \$30,000 in gold.

Mr. Holland is operating his mine on the North fork of Coffee creek. He uses the biggest self-shooter in the world in working the claim.

A Keystone driller is being operated on H. Lorenz, below Douglas City, this season ran water for six months with 250 feet pressure through a 4-inch nozzle. The bank, which is all gravel, is 40 feet high and averaged about 22 cents per cubic yard. The gold is coarse. The Journal says the Sikes M. Co., operating the Bloss

& McClary mine at Trinity Center, have finished their clean-up from a successful season's run.

the flats near the Van Matre ranch in Minersville and the bars for 4 miles will be thoroughly prospected. If results prove satisfactory a dredger will be put in.

The Cleary-Payne-Keenan Co. at Trinity Center has stopped its dredger temporarily while adding new and heavier machinery.

The Chloride mill near Dedrick is nearing completion.

TUOLUMNE COUNTY.

At Jamestown, Superintendent Blakeley will erect a 5-stamp mill on the John Royal mine.

On the eleventh level of the App mine a body of ore 50 feet in width is being opened up. Sixty stamps are operating in the App mill.

The Harvard mine employs thirty men. In the mill no stamps are dropping.

The Magnet says the Eagle Shawmut 100-stamp mill will have its full quota this fall. Two air compressors supply power for drills, etc. There are about 250 men employed.

At Stent H. Moore, superintendent of Mazzeppa mine, expects to erect a 20-stamp mill soon.

The Sonora Independent reports the App mine running steadily, with sixty stamps of the mill dropping full time. At the Dutch mine stoping is in progress at the 1200 level. The 20-stamp mill is running continuously on satisfactory ore from the 1200. The 40-stamp mill at the Rawhide is running day and night, the ore being stoped from the 800; the chlorination plant is also in operation.

Work has begun on the Mt. Hood mine. The shaft will be sunk 100 feet deeper. J. H. Burkhart is superintendent.

At the Shawmut mine 260 men are employed and the 100 stamp mill is running steadily.

The Rawhide G. M. Co. has filed a complaint in the U. S. Circuit Court against the Tuolumne County Water Co. and the Tuolumne County Water & Electric Power Co. for an injunction, accounting and damages. The complaint recites that on March 9, 1898, Nevills, Martin & Ballard entered into an agreement with the Tuolumne Water Co. whereby Nevills and associates transferred to the Jamestown Electric Light & Power Co. certain electrical machinery, pipe lines, wires, etc., from Summersville to the Rawhide and App mines, with a branch line to Sonora, so that the Jamestown Electrical & Power Co. should transfer and convey that machinery and electrical appliances to the Tuolumne County Water Co. by a conditional bill of sale. Nevills and his associates were to receive 40% of the net proceeds each month and credit should be given for all the light and power furnished Nevills and his associates until the full amount of \$150,000 should have been paid. It is alleged further that the respondent sold light and power to outside parties to the extent of \$50,000 per annum and that the actual expenses did not exceed \$6000 per annum. It is alleged also that the respondent has received the sum of \$30,000 beyond its proportion of the said net proceeds. Judgment is asked for the recovery of the possession of the power plant, and an injunction to prevent the respondent from collecting any more money. The defendant's side of the story is not yet received.

In the drilling contests at Stent on Sept. 1st, the double-handed contest, first prize \$100, was won by L. Page and Y. Terzich, who put a hole down in Rocklin granite 28 $\frac{1}{2}$ inches in fifteen minutes. A. Levinsky won the first prize of \$50 in the single contest, drilling 16 $\frac{1}{2}$ inches in the same time.

Near Carters, the Grizzly reaches the 1000-foot level this week. At the Jubilee group twenty men are working; Superintendent C. H. Colpe.

E. N. Ray, superintendent of the Sullivan mine, near Soulsburyville, will put in new machinery. The tunnel at the Lady Washington is progressing. Three shifts of eight hours each are at work with fifteen men. The new mill at the Lost Fox will be finished Nov. 1st.

YUBA COUNTY.

Marysville reports that after twenty years a quartz ledge on Frenchmans hill, near the Marysville and Quincy road, has been rediscovered again. It ought to stay discovered this time.

The Morris ravine gravel mine, owned by Goodall, Perkins & Co., San Francisco, is to be reopened after an idleness of several years.

The Secretary of War has approved the specifications of the California Debris Commission for barrier No. 1, to be constructed above Marysville, and has instructed them to call for bids for its construction. The cost of the work is estimated at \$171,000.

COLORADO.

ARAPAHOE COUNTY.

At Denver, on the 3rd inst., Attorney-General Post filed in the State Supreme Court a reply to the brief of the American Smelting & Refining Co. in the suit brought by him on behalf of the State for the purpose of dissolving the smelter combination. The points discussed are whether or not there is injury to justify the action and whether suit can be brought in the Supreme Court. The Attorney-General's brief contains the following statements: "A corporation organized for the purpose of creating a monopoly is organized for an unlawful purpose and should be dissolved. This corporation has been in existence only three years, and yet with such celerity has it proceeded that it now, as shown by the complaint, has no competition in the State and is supreme in its control of every branch of the metal industry. With a plant of less than \$7,500,000 in cash value, it dominates the entire mining industry of the State and pays a dividend of 7% annually on its stock of \$100,000,000."

CHAFFEE COUNTY.

Manager Goodwin of the New Monarch Co. of Salida says the smelter is in operation.

CLEAR CREEK COUNTY.

The Marshall-Russell tunnel, near Empire station, on the Colorado & Southern Railroad, has been driven 250 feet into the mountain and is reported to have intersected four veins.

Black & Co. of Empire have a lease on the Canova tunnel of the Helen Harold on Wood mountain, and at a point 200 feet from the tunnel mouth have a 19-inch streak of solid ore that carries \$70 per ton in gold, silver and lead values.

At Idaho Springs the Quito is believed to have another rich pocket of ore like the one taken out some years ago, when a place in the stope 16 feet high and 20 feet long yielded \$60,000 over the plates in the 10-stamp mill. An assay made last week from the rich streak gave returns of 347 ounces in gold. It is believed by the foreman that the next shipment of smelting ore will return at least 100 ounces in gold per ton, or a value of \$1 per pound. The product is treated at the Bonetta mill.

The Yankee Con. M. & T. Co. about two months ago began the operation of the Lomhard mine at Yankee, which has been a steady shipper since. Manager Seemann decided to do a little prospecting and has discovered nearly 12 inches of smelting ore that runs \$100 to the ton. The company has let another 100-foot contract on the Manhattan tunnel to J. C. Calhoun of Pine Creek.

Manager Burgess tells the Georgetown Courier that the Saxonia-Ruby tunnel of the Republic Con. Co. shows a 26-foot lode which contains an 18-inch smelting streak, while the rest of the lode is worth \$18 a ton. Assays from the smelting streak yielded \$153 per ton. Officers of this company arrived September 1 from Boston, and Assistant Manager F. H. Collins. It is expected that the holdings of the company will be examined and final action taken for the erection of a mill at the foot of the ore chute.

The Big Forty Co. is advancing its tunnel with air drills under the management of R. M. Snively.

W. E. Renshaw tells the Idaho Springs Gazette that his present intention is to reconstruct the State Ore plant. This will be in the nature of an addition to the Newton mill, which is among the possessions of the new company. The plan is to build a 100-stamp concentrating mill, or to double the present capacity. This will add about 300 tons a day capacity.

Near Silver Plume the Mary Etta group has been examined for Philadelphia men who propose purchasing the property and expending considerable money in development.

Work is now being done on the Terrible property through the silver ore tunnel. Manager Catron is arranging for extensive development.

Idaho Springs reports another strike in the Kinda mine. Manager Crawford has samples of ore which give assays of 332 ounces in gold and 213 16 ounces of silver to the ton. The property is on Fall river. The tunnel is in 550 feet. The streak of ore is 30 inches wide, smelting streak 12 inches, mill ore 18 inches.

Idaho Springs reports a deal by Boston men through E. M. Sabin. The properties are the Ocean Wave group, near Santa Fe.

Two Idaho Springs men have control of the Atlantic mill, at Empire, and will operate it on custom ores.

The Williams Fork M. & M. Co. will operate the Bohtail group of four claims in the northwest corner of this county, at the foot of Jones' Pass. It is on the line of the Moffat Short Line Railway. The mine is developed by a tunnel 350 feet in length, and a contract for another 100 feet has been let. Ore shows in the tunnel for

250 feet, the vein being from 1 to 3 feet wide. The company may erect a 40-ton concentrating mill on the ground.

The Conamara mine, Spring gulch, is being worked under bond and lease. The tunnel, now in 225 feet, will be extended. There is a 6-inch streak of ore in the breast, carrying three ounces gold per ton.

DOLORES COUNTY.

At Rico the Pro Patria mill is running, connected with the Scout tunnel, about 1 mile, by a tramway. W. J. Scout is general manager.

The Atlantic Cable mine is started up by Manager Campbell. The ore runs 35% zinc. They have a zinc mill and a body of zinc ore. Last year they shipped a train of twenty-five cars of zinc to Germany.

The Rico Consolidated Mines Co., under the management of P. S. Rider, is to begin work on several properties.

FREMONT COUNTY.

Near Florence the Spring Hill and two adjoining claims on Ten Mile hill are sold to the Keystone M. Co. Work will be carried on under the supervision of T. A. Mason. The shaft will be sunk 600 feet. The ore is principally copper, carrying gold and silver.

GILPIN COUNTY.

Central City says the Williams lode, in Lake district, is sold to the Williams Mining Co., who will begin active work.

Curnew & Co., leasers on the Chase property, have 25 men at work. The iron ores average 4 to 7 ounces gold per ton. Superintendent Miller has let a contract to run the 300-level workings on the Dacatur vein. The pump being installed, will handle the water so that the lower levels may be drained and miners put to work in them.

At Russell the Frontenac shaft building and plant of machinery were totally destroyed by fire last week.

GUNNISON COUNTY.

At Ohio City a strike is reported in the Chance Gulch, a 3-foot vein that runs well in gold and silver. The Mono mill will treat Granite mountain ore. On the Golden Islet, Manager Lejune has 14-ounce gold ore from this group of eight claims, recently purchased by E. P. Elsworth. The Cortland Co. have straightened out the shaft and are in shape to do economical development work.

LAKE COUNTY.

Near Leadville the Virginus mine has shipped 32 cars of ore to the Saldia smelter. The last car ran 1.79 ounces of gold, 11 ounces of silver and 54% lead, making the ore average nearly \$100 per ton.

A Twin Lakes mine is sold for \$8000—the Simons group, on Mineral hill, in Willis gulch—to O. P. DeFord of Iowa Falls, Ia. The property consists of twelve claims and a mill site.

At Leadville there are a number of mine managers who are awaiting the opening of the manganese market, promised with the completion of improvements at the steel works at Pueblo. Leadville mines used to ship to Chicago steel plants, but with the shutting off of that market on account of freight rates, it was necessary for all manganese to be cut off. There are some small leases on Fryer hill which can produce a scattered tonnage, but the main supply can be made from the Caribou, Coronado, Sixth Street and others of that locality.

T. Rainey will sink on the Boulder group of mines at Evansville 200 feet; shaft, 4½x13 feet.

LA PLATA COUNTY.

Near Durango, the Gold King-Swamp Angel group at Oro Fino has begun development under the management of F. J. Doran.

MINERAL COUNTY.

The output of ore from Creede for the month was 6596 tons.

A new leasing company is organized to work the Nelson claim at Sunnyside, adjoining the Corsair; the discovery shaft is to be sunk 400 feet deeper. The United Mines and Big Kanawha properties show improvement. The mill is handling 150 tons every 24 hours; about 100 tons of crude ore are shipped daily to the smelters. The Humphreys tunnel is being continued northward.

OURAY COUNTY.

The Bonanza group, 2 miles south of Ouray, on Mount Hayden, has been visited by fifteen men from Chicago and St. Louis, who will develop the property. A tunnel is completed to the shaft and another drift run 70 feet on a vein half way down to the shaft; the ore is now exposed for 300 feet. The vein is largely shipping ore, although some milling ore is being saved for treatment when a mill is erected. A 900-foot crosscut tunnel will be started which will tap the ore bodies 1400 feet deep. Fourteen men are employed;

it is the intention to use air drills on the new tunnel.

Ouray reports a strike of ore in the West View workings of the American Nettle. —The Camp Bird mine, under the new management, is making a large output from the developments made by the former manager. The daily yield from the mills is reported to be nearly \$10,000.

PARK COUNTY.

The Maclean G. M. Co. owns the Golden Era group, Mount Loveland; ore goes \$80 gold, 26% lead and some silver per ton.

PITKIN COUNTY.

On the Mollie Gibson and Argentum-Junata properties work has been stopped indefinitely, with no immediate prospect of renewal. The management of the Mollie Gibson is pulling the big pumps from the mine and the water will be allowed to rise from the thirteenth to the tenth level. It will be kept at the latter point for a time at least by the pumps of the Smuggler, adjoining, whose ninth level is on a line with the Mollie's tenth. Work on the Argentum-Junata was suspended in June and it is likely that mine will also remain idle. These properties have always been expensive ones to operate, owing to the immense flows of water encountered, and, being silver propositions, a heavy production was required to enable work to be done at a profit at present quotations for silver. Both these mines have been heavy producers in the past, the Mollie having a record of over \$7,500,000 gross production.

PUEBLO COUNTY.

Announcement is made in Pueblo that the Philadelphia smelter at that point will be closed down indefinitely October 1, by reason of the failure of a certain character of ores used.

SAN JUAN COUNTY.

The Standard says the greatest depth attained on any vein in the county was made last week when the original North Star vein on King Solomon mountain was cut at a perpendicular depth of 2850 feet by the Highland Mary tunnel.

Superintendent Snow will resume operations on Sultan mountain September 10.

The Brooklyn mine, near Chattanooga, averages three carloads per week; values, between two and three ounces in gold and a small amount in silver. During August \$3500 worth of ore was shipped at a cost of \$800; net profit, \$2700.

The Kendrick-Gelder smelter is producing 60% copper matte.

SAN MIGUEL COUNTY.

Near Telluride, at the Double Eagle tunnel is in 80 feet. Manager Litchfield expects to make the property a continuous shipper.

The Butterfly-Terrible Co. has leased all the workings above No. 1 tunnel, the main working level of the upper mine. Leasers will pay a royalty of 25% on the net profits and keep ten stamps in the mill going.

The Hector M. Co., including the Ophir tunnel and the Cimarron mill, has closed down, nearly 100 men being thrown out of employment, owing to a disagreement as to wages.

SUMMIT COUNTY.

The Robinson smelter is to resume. A second furnace is on its way. Manager Buckley expects to have the plant in operation by November 1. The plant is handicapped by the smelter trust, to whom it must sell its matte product. When the Bimetallie smelter was in operation in Leadville before the trust was organized it received \$12 a ton more for its matte product than the Robinson smelter is receiving now.

The Journal says: At Montezuma, the Bullion, California and Silver King keep six four-horse teams busy drawing away the shipping product, consisting of silver-lead ore, and the milling ore is being piled up awaiting the completion of repairs on the Silver King mill.

In Breckenridge four mills are running steadily, viz., the Cashier, Mountain Pride, Washington and Junata, and a fifth, the Hamilton, will be ready to start next week.

J. H. Myers has organized a company to operate in the Frisco and Green Mountain districts. —The Admiral group, near Frisco, is being worked by a new company.

Manager Rose of the Rothschild tunnel, at Argentine, is in over 1200 feet.

At the Cashier, in Brown's gulch, near Breckenridge, Manager Wood has put new machinery into the big mill. A 6-ton crusher is being put in.

Owing to the heavy rains, the Gold Pan placer at Breckenridge and the Oro Grande at Dillon expect to continue sinking to bedrock.

The Hamilton mine and mill on the Swan is in the hands of a syndicate, with H. H. Nicholson of Lincoln, Neb., in charge.

TELLER COUNTY.

The Colorado plant of the U. S. Refining

& Reduction Co. was closed almost all of August.

The railroads running out of the district had entire trainloads of ore on the tracks waiting for transit. The tonnage of the month, if it could be checked up, would prove to be the banner month in the history of the district, but as it was not treated, the mills do not report it. The tonnage for the month figures up to 55,012 tons, the gross value of which amounts to \$1,960,162. The figures as given out by the various reduction plants and smelters are as follows:

	Tons.	Av. Val.	Total.
Smelters.....	13,500	\$50 00	\$ 697,500
Union.....	12,000	30 00	360,000
U. S. R. & R Co.....	12,000	35 00	420,000
Economic.....	4,650	28 00	130,200
Arequa.....	612	13 50	8,262
Dorcas.....	2,800	26 50	74,200
Telluride.....	1,000	30 00	30,000
Portland.....	8,000	30 00	240,000
Total.....	55,012		\$1,960,162

The Zenobia plant will be ready to start September 10. The delay has been taken advantage of by cutting stations at the depth of 200, 300, 400 and 500 feet, and the work of extending the levels away from the shaft is well under way. The new hoisting plants will be good for a depth of 1400 feet. It is the intention to sink to that depth as fast as possible.

The statement of the Golden Cycle M. Co. covers the operations for the first six months of 1902. Operating expenses, \$141,782.82, included \$8793.63 for buildings and new machinery; cost of sinking the shaft 200 feet, \$40 per foot; tons shipped by company, 19,970; by lessees, 1129; gross value of 21,108 tons, \$395,579.90. Proceeds from ore sales and royalties (after deducting freight and treatment charges), \$227,095.35; receipts from other sources, \$341, total, \$227,436.35. Operating expenses, \$141,782.82; \$8793.63 spent for buildings and machinery; net profits for this period, \$85,312.53.

A. Wagner of the Pharmacist Con. denies that there are any negotiations pending for a consolidation of the Pharmacist with the Free Colage, Empire State and the Acacia companies.

C. C. Hamlin, manager Granite G. M. Co. at Victor, says that the production of that mine for August was 1500 tons of average \$30 ore, principally from the fifth, sixth, ninth and tenth levels. The vein opened in the tenth level west of the old vein has been opened in the ninth and eighth levels, where it is equally as good as in the deepest workings, giving a new vein 4 or 5 feet wide that is yielding ore averaging \$30 a ton.

S. R. Guyot is personally in charge of operations under way by the Surety M. Co. on the Denver claim on Howell hill, due south of Stratton's Independence. In the bottom of the shaft 3½-inch drills are used.

Cripple Creek advices are that a 50-ton shipment by La Montague Bros., working a lease on block 8 of the Cameron school section, went about two ounces gold to the ton, mined from the 350-foot level. A crosscut from the 450-foot level should encounter the ore shoot from which shipments are now being made.

Wilson and associates, leasing the Gold Sovereign, have closed a carload shipment that is expected to give returns of two ounces in gold to the ton. They also have a sub-lease from the Cripple Creek Gold Temple G. M. Co.

In expectation of a heavy flow of water with additional development work, the St. Patrick Co., Victor, south of the Gold Coin, has cut a pump station at a depth of 700 feet and will there install a larger pump.

The Practical Leasing Co., operating the Trachyte of the United Mines Co., is daily shipping forty tons; average value, \$25.

F. H. Minard of Denver has a bond on the Santiago group of eleven claims and a mill site in the East Argentine district for \$175,000. He agrees to do a certain stipulated work before May 1, 1903, when the first payment of \$50,000 is due, second payment of \$50,000 due November 1, 1903, the third payment of \$75,000 six months thereafter.

WELD COUNTY.

At Eaton, J. A. Banning of Denver has the contract from the Cache la Poudre Reservoir Co. for building an irrigation ditch, solid rock, 99 cents a cubic yard; loose rock, 34 cents; dirt work, 12.25 cents a cubic yard; total, about \$200,000. The company plans to let contracts for a main reservoir in Boxelder valley, capacity 1,100,000,000 gallons water.

IDAHO.

BLAINE COUNTY.

J. M. Banville, foreman Liberal group of mines, Little Smoky, says that on the Liberal M. Co.'s property the shaft is 350 feet deep. When the 500-foot level is reached the Liberal will have an entirely

new hoisting and working outfit and a mill. The machinery now at the mine was intended to work on the 500-foot level.

The Idaho State Board has placed the value of patented mining claims at \$270.

C. Brewer is reported to have a 60-foot gold ledge near the Mayflower property, at Martin.

IDAHO COUNTY.

Another new mining camp is reported 40 miles southeast of Thunder mountain, near the old Goose Creek placer mines, 25 miles from Custer. About 200 claims have been located.

Thunder Mountain reports that the Dewey mill is running and is saving 78% without the aid of a concentrator, and that the cleanup on the Dewey after two weeks' work was sixty pounds.

OWYHEE COUNTY.

Manager Britt, of the Poorman mines, tells the Nugget that the drift north from the shaft on the 1000 foot level has been running continuously in excellent pay ore for some time past, and has now reached a point 400 feet north of the shaft.

The Silver City Avalanche says the Dewey tunnel has tapped the old Black Jack vein. The Trade Dollar Con. M. & M. Co. has a valuable gold and silver mining property. —The strike in Florida mountain was made August 23. Manager Hutchinson says the vein was tapped 300 feet beneath the old Blaine tunnel. There remains about 140 feet of sinking on the proposed connecting shaft when the tunnel will be complete for the entire 14,000 feet, when the Florida Mountain mill at Dewey will be crushing. The vein has now been developed a distance of 6300 feet.

The Palmer group of mining claims, near Silver City, have been bonded to W. H. Dewey for \$35,000.

SHOSHONE COUNTY.

A Spokane dispatch of the 2d says the fight between the mine owners of the Cœur d'Alene and the smelting trust has reached a crisis and the mine owners have refused to ship any more ore to the trust until a satisfactory settlement is reached. On the 1st the Cœur d'Alene mines, except the Bunker Hill and Sullivan, refused to make any shipments to the trust, and the gage of battle is fairly thrown down. A conference of the miners was to be held at Spokane on the 2d, attended by J. A. Finch and A. B. Campbell of the Standard and the Hecla, E. J. Roberts of the Empire State, Idaho; P. Larson of the Morning, F. Burbridge of the Cœur d'Alene Dev. Co., and R. Wilson of the Mammoth. The conclusion to be reached then is to be of importance. Unless the trust makes concessions it is expected that the mine owners will continue in their policy of refusing to ship their ore. The consequence must be the closing down of the mines unless other arrangements for marketing the product are secured. The mine owners, it is expected, will not continue to put money into extracting ore and concentrating it unless returns can be secured. The conference of the 2nd is a continuation of the recent conference in Chicago, when C. Sweeney, A. B. Campbell and P. Larson discussed the situation without any satisfactory conclusion being reached. The mine owners demand two things. The first and most important is decreased charges for freight and the treatment of their ores. It is generally conceded that the trust is getting profits out of the tariffs charged for freights. The mine owners have at last revolted against the situation. In addition they are demanding an increased tonnage. (No further news of the Spokane conference had been received up to noon on the 5th.)

On this subject and in connection with a project for a lead smelter at Spokane, Mr. T. L. Greenough of the Morning and You Like mines, says that the prospects of Spokane having a lead smelter to treat Cœur d'Alene ores are better than they ever were before. The plant would have a capacity of about 1000 tons a day, and with a refinery would employ from 600 to 1000 men. Mr. Greenough is a partner with P. Larson in the Morning mine at Mullan, Idaho. He lives at Missoula, Montana. He says the mine owners of the Cœur d'Alene have been considering the erection of their own smelters for the past three months, ever since the conference they held in May with the officials of the American S. & R. Co. Relations with the smelting trust are not satisfactory, and the mine owners are considering any means at hand for bettering the situation.

"We have been looking over the advantages which Spokane offers as a smelting site, and they are excellent. There is a down-hill haul to here from practically every mining camp nearby, except Sumpster, Or., and there is a direct road to Republic, which would supply a large portion of the siliceous ore needed to flux the galena. We have been conferring with railway officials with regard to freight rates, and are satisfied they will meet us

in a proper spirit." The committee of mine owners having charge of the matter has had an expert in Colorado for some time, looking over the situation there. It is probable that the output of the Cœur d'Alenes will be distributed, with part going to Spokane and part going to Colorado. The present output of the Cœur d'Alene lead mines is about 12,000 tons of raw ore and concentrates per month. That, however, is on the restricted basis demanded by the American Smelting & Refining Co. If the mine owners build their smelter, the output would probably be increased to 15,000 tons monthly. The outlook for lead is good. A year ago there was a surplus of 50,000 tons on hand. Now that has been practically worked off. The site for the smelter would be fixed by the question of economy, pure and simple. It would be built where it could be operated most cheaply.

Wallace reports another strike of lead and silver within 800 feet of the end lines of the new Hercules. The property is owned by Gilpin, Heyburn & Miller. The Atlas M. Co., with property on Stevens Park, has \$10,000 for development. The force of miners on the Atlas will be increased and a compressor installed.

Two large dredgers will be in operation on the gold properties on Beaver creek Sept. 15.

The Powhattan mine on Big creek has a ledge 2½ feet wide of carbonate ore which assays eighty-eight ounces silver and 5% lead.

Work on the Missoula, east of Mullan, is being pushed with two shifts.

At Wallace is incorporated the Stewart M. Co. to develop and sell ores from the Senator Stewart mine at Kellogg, Yreka mining district. A. M. Strode of Mullan, A. Benicke of Wardner, W. N. Morphy, C. Kalle, N. W. Thornton of Wallace.

Osborn reports progress on the Capitol mine, operated by the Capitol M. & M. Co. Manager Whelan is running a 1000-foot tunnel.

Extensive development is to be done on the Reindeer copper property near Mullan. The tunnel will be extended another 800 feet. Good copper ore is being taken from the face of the drift.

MONTANA.

FERGUS COUNTY.

The Alder Gulch M. Co., E. W. King president, G. Putnam of Chinook treasurer, will work twenty-four claims in that section, including the Putnam & Zortman properties and the Alabama claim. Men will be put to work. A 100-ton cyanide mill is projected.

GRANITE COUNTY.

The Bear Mountain P. M. Co., J. D. Murphy, manager, will work the Pine Ridge placer deposits, at the head of Cayuse gulch, 2 miles east of Garnet.

The Montana G. M. Co. has shipped from its mine, the Sunday, near Phillipsburg, eleven tons of ore, the result of a strike in gold quartz.

The Phillipsburg Mail reports that at Sunrise, near by, at the Sunrise mill and concentrator nearly everything in the ores is being saved daily, capacity seventy tons. The entire district is now practically controlled by the Henderson M. Co., succeeding the Sunrise M. & M. Co. and McLure syndicate. Fifty men are employed. F. D. Brown is manager, C. C. Spencer assistant superintendent.

On Stony creek, 16 miles west of Phillipsburg, on the property of the Michigan & Montana M. Co., J. H. Ortmann manager, an ore body is struck 80 feet from the tunnel entrance. The lead in the upper workings is 4 feet wide; assays average \$45 per ton gold.

JEFFERSON COUNTY.

Fifteen men are developing the Grey Eagle mine. The ore goes to the smelter at East Helena.

The Ada mine is shipping ore to the Colorado smelter at Butte. The mill of the Eva May Co., in Basin, is to be overhauled for a run. D. Sweeney is working the Silversmith mine near Basin. Fifteen men are developing the Buckeye mine near Basin. The mill is running constantly and the concentrates are being shipped to Butte.

MADISON COUNTY.

C. H. Hand, manager Watseca M. Co., near Rochester, tells the Inter-Mountain the Watseca, since 1866, has been worked almost continuously and has been a large producer of gold ore, but up to the time the company took hold of it, in 1893, no work had been done below the water level. Since then a shaft has been sunk 550 feet on an incline and more than 2 miles of underground workings made. Sulphide ore was found at a depth of 350 feet, is 200 feet below the water level, and has continued as far as the mine has been developed, the ore being as rich as the oxidized ore and a greater quantity of it. The vein of the Watseca averages about

6 feet in width, with an average ore streak of ¾ feet in width in the lower workings. Since the company took the property it has extracted about 30,000 tons of ore, average \$26 in gold per ton. The company is preparing plans for a mill, with capacity of 125 tons per day. After the new mill is finished the old mill will be run on custom ore. The present output of the mine is about fifty-five tons of milling ore per day, but twenty tons per day are shipped.

The Abby-Alice M. Co. of Butte is operating the Carpenter claim under lease and bond.

Next to the Watseca in point of production is the Buffalo, owned by E. Mueller of Rochester.

The Thistle lode is developed by a shaft 300 feet deep, with levels and crosscuts to match.

The Longfellow, owned by J. A. Murray of Butte, is under lease and bond to Minnesota parties. The mine has yielded a large quantity of good ore, and under the management of E. W. Merritt of Rochester will become a steady producer.

The Cooper property, owned by Cooper Bros. of Rochester, is developed to a depth of 340 feet. It has a 10-foot vein, containing a 2-foot paystreak. The value of the shipping ore is about 70% lead, \$4 50 gold, sixty-five ounces silver.

MISSOULA COUNTY.

A strike is reported on the Richmond, a copper property near Salters, 20 feet of solid ore while sinking 600 feet.

SILVER BOW COUNTY.

There have been several large fires in and around Butte in the last month, destroying considerable property and temporarily throwing a number of men out of employment. Near that city, on the 31st ult., the entire hoisting plant, pumping station and shaft house of the Alice Con. G. & S. M. Co. was destroyed by fire. Loss estimated at \$100,000, partly covered by insurance. Part of the fire crept down the shaft, but as it was Sunday no lives were lost. The flames spread rapidly, and for a time threatened the mill and smelter and the town of Walkerville.

At Butte the concentrator of the Montana Ore Purchasing Company was totally destroyed by fire; loss, \$100,000, \$60,000 insurance. It will take two months to repair the damage. In the meantime 300 men will be laid off.

At Butte the Parrott mine has resumed operations; about 400 men are at work.

NEVADA.

ELKO COUNTY.

The Dexter-Tuscarora G. M. Co. recently broke down 1700 tons of ore with one blast, the mass having an estimated gold value of \$5 per ton, or \$8500.

ESMERALDA COUNTY.

The Kiondyke mines are situated 14 miles south of Tonopah. The mines are under bond to the Tonopah M. Co., which is doing development work, sinking shafts and inclines. About \$40,000 worth of ore has been shipped by leasers digging where they could find ore that would pay to ship. The main ledge lies between granite on the foot and lime on the hanging wall.

Superintendent Colend, who has charge of the Esmeralda Con. mines, near Hawthorne, is preparing for the erection of a 20-stamp mill and laying 16 miles of water pipe.

EUREKA COUNTY.

Ore shipments by rail from the mines of Eureka district for the week ending August 29 were as follows: Bay State, 21,750 pounds; Eureka Con., 104,040; Jackson, 71,350 From Hamilton: L. Lani & Co., 33,750; Rocco-Homestake, 55,970.

HUMBOLDT COUNTY.

At Kennedy, Wynn & Lasher are daily running through the mill 75 tons ore. They have 60 men at work for the New York company that controls the property. Miners get \$3.50 a day. The nearest railroad point to Kennedy is Lovelock, but two ranges have to be crossed.

LYON COUNTY.

The new mill and concentrator for the Nevada Chief Co. is hauled to the mine at Rockland.

A shipment of a bar of bullion valued at \$6,023.10, of which \$5,790.14 was gold and \$232.96 was silver, is the returns from 265 tons of ore from the Silver Hill mine, worked at the Pollard mill in Silver City; the third shipment made on August account, bringing the yield of the mine for that month up to nearly \$18,000.

NYE COUNTY.

For the quarter ending June 30th the sheriff collected \$5,000 bullion tax from Tonopah mine owners.

The length of the pipe line to bring water to Tonopah from Twin river will be 70 miles, daily capacity 1,000,000 gallons.

At Tonopah the main Mizpah vein is 4

to 8 feet in width, the ore averaging \$100 gold and \$200 silver.

Tonopah reports a strike in the McNamara. The McNamara shaft is 1000 feet from the Mizpah workings. They sunk 200 feet and drifted, and it is said caught the Mizpah ledge.

Water is reported struck in one of the Tonopah mines at a depth of 400 feet. About 1000 gallons a day are being hoisted.

STOREY COUNTY.

The Belcher M. Co. has levied an assessment of 10 cents per share, delinquent Oct. 7.

The Savage mine reports 425 level (from the Gould & Curry tunnel) opening on the eleventh floor of the upraise above the north drift from No. 2 crosscut, in material too low in grade to save. As soon as the top is timbered prospecting from this point will be continued.

The Silver Hill M. Co. has advices of the shipment of bullion valued at about \$6400 in gold, from the cleanup at the mill on August account, making total shipments for that month of over \$11,000.

In the Best & Belcher mine the main raise above the end of west crosscut No. 1 on the 365 level is up 22 feet, without change in the formation. The south drift is out 25 feet. Repairs continue on the 425 level.

In the Utah Con. mine, upraise No. 2 from the south drift from surface tunnel No. 2 is up 23 feet in low-grade ore.

The Ophir M. Co. has received \$4868.18 in gold coin as gross proceeds of the sale of four carloads of ore.

Drill hole No. 2 on the Brunswick lode is down 490 feet and still in porphyry.

WASHOE COUNTY.

At Reno is incorporated the Pyramid Lake M. & M. Co.; C. W. Bidwell, F. O. Norton, F. H. and C. A. Norcross, J. S. Orr.

Oro Fino M. Co.; J. C. Jackson, R. Nelson, R. Peterson.

At Olinghouse, the Crown Point is bonded to C. B. Bell for \$15,000. He has placed D. R. Wilkinson in charge.

Benson & Co. milled sixty tons Jumper ore which went \$30 per ton.

WHITE PINE COUNTY.

A recent strike in Ely, in the Ruth, averages 23% copper. The Ruth shaft is down 275 feet.

NEW MEXICO.

SANTA FE COUNTY.

The First Chance, formerly the Cash Entry mine, near Cerrillos, is being developed by Geo. Whitmore, who will erect a concentrator plant to treat the lead, zinc and silver ores of this and other mining claims owned by the company. The Cunningham Hill mines, near Dolores, owned by S. H. Elkins, are being worked. Free gold is the main ore. The Con. M. and S. Co. are putting men to work in the Blue Bell mines. Carley and Aranda are working the Gold Standard mine near Golden.

J. D. Whitman lately visited the district near Cerrillos, where T. A. Edison has expended \$300,000 in an attempt to catch the fine gold of Cunningham Hill. The Edison works are standing idle and it is locally thought that he has given up the attempt. Cunningham Hill is a noted spot for New Mexicans, as they have been working the dry placers for years. The region covers an area 6 by 12 miles, overlaid with coarse gravel that carries a cement in which the gold is embedded. Many tests gave \$3 a ton by ordinary methods of extraction, but the absence of water makes it impossible to work the deposits on a large scale. The drift carrying the cement can be traced for 200 miles through New Mexico and into southern Colorado.

OREGON.

The Tempest mine is sold to C. R. Alden for \$50,000. He represents the Tempest M. & S. Co. of Spokane. The property embraces four claims in the Greenhorn district.

A placer strike has been made in the vicinity of Geiser. Business men there formed an association to operate a prospecting drill in quest of extensions of the river channel opened in the Winterville diggings. At a depth of 130 feet a pipe-clay bedrock was passed through, and 4 or 5 feet of rich gravel found.

BAKER COUNTY.

The Mammoth mine, Baker City district, has been sold to Michigan men for \$35,000, \$10,000 down. It is 1½ miles east of the Virtue mine.

Manager Simpson, Maiheur G. M. Co., has sunk 100 feet on the vein, and is now crosscutting both ways. The ore in the bottom of the shaft shows free gold.

J. F. Meikle, in charge of the Minnesota Co. at the porphyry dyke, says the property is big enough for 100 stamps, and a mill of that capacity will ultimately be erected. Mr. Meikle is also superintendent of the Goiconda, Craoker creek.

A. C. Roundtree has been inspecting

the Flagstaff mine, where the water is from the 700 to the 500-foot level. From the 260-foot level two veins contain a percentage of free-milling ore, but mostly sulphates. These ores carry slimes. Mr. Roundtree says: "I am satisfied this has been the great trouble with the Flagstaff all along. The people who have attempted to operate the mine did not know how to manage the slimes."

They should have read the MINING AND SCIENTIFIC PRESS, which tells how.

Superintendent Massie of the Mammoth mine has commenced deep sinking. This will be followed by erection of a stamp mill and other necessary machinery.

The Democrat says C. A. Johns has bought the Baisley-Elkhorn mining property for \$4000, subject to a mortgage of \$34,000 and a prior judgment of \$1000. He bought the property at sheriff's sale; the sale was held on a judgment of approximately \$5000. Besides the mortgage and the \$1000 judgment, there are numerous other claims against the property.

DOUGLAS COUNTY.

G. W. Crews has sold his mine on South Myrtle creek to McCarty, Wagey & Co. of Portland for \$15,000. The purchasers intend to put up machinery. The Continental shows plenty that assays \$17 per ton.

SOUTH DAKOTA.

CUSTER COUNTY.

At Custer the Black Hills and Duluth Copper Co. has let a contract to H. H. Francis to sink a shaft 500 feet.

LAWRENCE COUNTY.

The machinery for the 500-ton mill for the Horseshoe M. Co. at Terry, contract for which has been given the Allis-Chalmers Company, Chicago, consists of a separate crushing plant to be built about 500 feet from the 120-stamp mill; the ore to be delivered by rope tramway of railroad cars at the crushing plant, in storage bins, below which are two Gates gyratory rock breakers; the crushed rock and coal delivered to the stamp mill by a 24-inch belt conveyor, so arranged as to deliver the ore at any point in the bins back of the stamps, as may be desired, or the coal in special bins placed in front of the boilers. The power plant for the crushing mill consists of a Reynolds Corliss engine; the 120 stamps each weigh 1000 pounds. The mortars are of special construction, double discharge and so constructed as to make the smallest possible amount of slimes. The power for the stamp mill is in the center of the mill and consists of a Reynolds tandem compound Corliss engine. The stamp countershaft is driven by belt from the engine, 60 stamps being placed on either side of the power plant. The crushed ore is delivered to the cyanide mill, where the product is treated in steel tanks as usual. The entire mill was designed by C. M. Fueller, of Denver, who acted in the capacity of consulting engineer of the Horseshoe M. Co. The mill is designed to be one of the most economical in operation in the Black Hills country, which is noted for its low cost in the treatment of low-grade ores.

PENNINGTON COUNTY.

Twenty stamps of the Keystone mill are being dropped by the Holy Terror Co. on ore from the tenth and eleventh levels of the Holy Terror mine. This ore is being taken from the two deepest levels in the mine. The company is lifting 600 gallons of water a minute out of the shaft, and it is estimated that it would be necessary to handle at least 300 gallons more but for the bulkheads that have been put in to shut off the stream from the abandoned stopes in the mine. There are places in the mine where the water comes in with such force as to indicate that there is an artesian basin at hand, this being revealed by the operations of a diamond drill, below where any actual mining has been done. Several of the holes drilled with the diamond machine proved to be spouters, and to show what force the water would develop 2-inch pipes were put in, with steam gauges attached. One of these showed ninety-five pounds and the other eighty pounds. When the Holy Terror first started its mill it was necessary to pump water from bedrock. Enough water is being pumped out of the mine at present to run a mill of 100 stamps.

TEXAS.

JEFFERSON COUNTY.

Beaumont reports oil is now held at 40 cents a barrel; a further advance is looked for.

UTAH.

BEAVER COUNTY.

The News hears from Copper Gulch of work on the tunnel planned by Samuel Newhouse to afford an outlet for the ores of the Cactus mine. The mouth of the tunnel will be toward the site of the proposed concentrator and townsite in Wah valley, a mile in length, opening the

vein at a depth of 700 feet below the surface at the present shaft, which is now down nearly 600 feet. The initial capacity of the concentrator will be 500 tons, but the intention will be to enlarge it to 1000 tons. It is understood that the Frisco branch of the Oregon Short Line will be extended around the mountain, so that the mill product can be loaded on the cars.

JUAB COUNTY.

Ore shipments from Tintio district for the week amount to seventy-five carloads, divided among the mines as follows:

Uncle Sam.....	5
Yankee Con.....	6
Eagle & Blue Bell.....	5
Bullion-Beck.....	6
Gomul.....	10
Carlisa.....	5
Star Con.....	3
Mammoth.....	8
Grand Central.....	7
Lower Mammoth.....	2
Sloux-Utah.....	1
Dragon Iron mine.....	16
Martha Washington.....	1
Total.....	75

The Mammoth mill sent out two carloads of concentrates and one bar of bullion.

The Utah of Fish Springs has a car of ore; camp assays indicate 60% lead and 114 ounces silver per ton.

PIUTE COUNTY.

Near Kimberly the mill on the properties of the Annie Laurie is in operation. C. I. Rader general manager. The original plant, which was designed to treat 6000 tons of gold-bearing quartz per month, has been enlarged to a daily capacity of 300 tons. The payroll shows 280 persons.

SALT LAKE COUNTY.

(Special Correspondence).—The United States smelter, located at Bingham Junction, are pushing the work as rapidly as possible, but have been delayed in getting material. They intend handling the ores from the United States mine in Bingham and the Centennial-Eureka mine in Eureka, the Bingham mine being sulphide and the Centennial-Eureka high silica ores. The plant will have a smelting capacity of 850 tons of ore. They are using blow engines instead of rotary blowers. There will also be a converting plant. The construction is all of steel and brick. The charging devices, etc., are as mechanical and automatic as it is possible to make them. Electricity will be used in nearly every place in the plant. The slag will be granulated by means of water. A complete equipment of machine shop, blacksmith shop, etc., will be included. The smelter owns its own steel railroad cars. They will also use hot blast in their smelter. They have a sampling mill and are prepared to treat some outside ores in addition to their own. They have two of the largest mines in the State to draw from. The plant will be first-class in every respect and the management have spared no pains or money toward that end. G. K. Fischer of Salt Lake City is the chief engineer.

Salt Lake, Aug. 30.

(Special Correspondence).—The corner stone of the miners' home in Salt Lake City was laid to-day with a trowel made from silver from the Silver King mine at Park City. The miners of Park City presented Mrs. Judge with the trowel.

Salt Lake City, Aug. 31.

The Tribune says connection with the main ore-bearing channel on the property of the Columbia M. Co., at Bingham, has been made through the lower or Cunningham tunnel; samples of rock by Manager Cooke show the presence of native copper.

In the Dalton & Lark group at Bingham a strike is recorded showing 24% copper, fifty ounces silver and \$1.80 gold.

The Cluster M. Co.'s property is the Talco group at Bingham, to be opened up by tunnel under the management of C. A. Talco.

SUMMIT COUNTY.

(Special Correspondence).—The Daly-West mine at Park City are handling 200 tons per day in their concentrating mill. They are operating fifteen concentrators which are handling a product from 6-mesh and the undersize to 200-mesh. The table handling 200-mesh produces one ton per day. F. W. Sherman is superintendent of the mill. The mine and mill employ about 500 men. They have large bodies of ore which will average 55 to 60 ounces silver, 22% to 25% lead, 2 1/2% to 3% copper and about \$1 in gold. They pay a monthly dividend of \$108,000. John A. Kirby is general superintendent.

Park City, Aug. 29.

(Special Correspondence).—The Grand Central M. Co. at Mammoth have started constructing a 4500-foot aerial tramway from the mine to the railroad for transporting ore. The work is being done by

Jones & Jacobs, Salt Lake City agents for Trenton Iron Works. The tramway will have a capacity when completed of twenty tons per hour.

Mammoth, Sept. 1.

(Special Correspondence).—The Wabash M. Co., Park City, has working thirty-five men doing development work, running drifts, sinking a double-compartment shaft 600 feet with single deck cages. The mine has a 12x14 hoist and 18x16 air compressor. G. M. Gillette is superintendent. The Daly-Judge mill are making many changes. They are now handling about 100 tons of ore per day and are increasing the capacity to 300 tons, adding tables, rolls, etc. They have placed an order for part of the machinery. G. H. Elmore of Joplin, Mo., is making some tests on the new Century drop motion jig. The ores are lead, silver and zinc. J. M. Callow of Salt Lake City is testing a shaking screen for fine screening down to 150 mesh. The screens have been in operation at the Cactus experiment plant at Frisco.

The Daly-Judge is cleaning out the mine and old stopes and doing development work. The Anchor tunnel is 6600 feet to the shaft. All of the ore is dropped down to the tunnel level and transported through the tunnel to the mill. The Anchor shaft is down 1400 feet. J. J. Broughall is superintending the erection of the mill.

Prof. Emmons and staff of the U. S. Geological Survey are making extensive investigations in the Park City district.

The Silver King M. Co. are starting up the new Cummers drier for handling the concentrates from the mill. The drier will handle fifty tons per day. They are shipping about forty-five tons of high-grade concentrates daily.

Park City, Sept. 1.

Park City reports the following shipments of ore from the Mackintosh sampler for the past week:

	Pounds.
Daly West.....	3,444,000
Ontario.....	1,036,000
Loring Con.....	160,000
Anchor Con.....	151,000
California.....	18,000

Total.....4,809,000
Silver King.....1,155,180

Grand total.....5,964,180

TOOELE COUNTY.

The Pittsburg & Utah Gold, Silver, Copper & Lead M. Co. has incorporated. The property is located in Ophir mining district; W. B. MacSherry, J. D. Porter, F. C. Hendershot, F. A. Sauer, R. L. Kidner.

(Special Correspondence).—The Consolidated Mercur G. M. Co. at Mercur probably have the largest cyanide mill in the State, if not in the United States. They are handling about 1000 tons of ore per day, employing about 185 men in the mill and 365 in the mine. All the ore from the Mercur mine is transported through the electric tunnel, which runs through the tailings dump and is hoisted into the mill. The incline runs through the mill. All the large buckets are on the main incline and drawn by skips to the mill. The skips hold three tons, which dump into Gates crushers and the material from there goes through coarse and fine rolls. The base ore goes through the roasters and is crushed to about 12 mesh. They have twenty-six leaching tanks, each holding 250 tons. It takes about five days to leach a tank of the ore. They have nine roasters, nine sets of Gates rolls and two Gates crushers. In place of calcining the talcy ore, it is screened out and placed on top of the tanks. Something over one-half of the ore that goes through the mill is base. The DeLamar precipitators are used, as well as the filter presses. They use zinc dust in place of zinc shavings. They have their own refinery and ship hullion that averages 970 fine. They are equipped with their own power plant, in case anything happens to the Telluride Power Co., which supplies them with power. The tailings mill at Manning, owned by this same company, handles about 400 tons per day at a profit of 50 to 75 cents per ton. In treating the ore they use about one pound of cyanide to the ton—as a rule slightly under that—about 3/4 of a pound of soda and 1/8 of a pound of zinc, and it takes about 150 pounds of coal to roast a ton of base ore. They have more ore in sight at present than at any time since the company started to do business. Harry Colhath is superintendent of the mills and George Z. Edwards general superintendent.

Mercur, Sept. 1.

(Special Correspondence).—The process in use at the Sunshine G. M. Co.'s mill at Sunshine, which was fully described in a recent issue of the MINING AND SCIENTIFIC PRESS, has proven beyond all doubt to be a success, and Manager Geo. Moore and Superintendent D. J. Kelly are

to be congratulated on their achievement. They are handling 200 tons of ore per day. Sunshine, Aug. 31.

WASHINGTON.

SNOWHOMISH COUNTY.

At Index a 300-foot tunnel is to be started on the Ethel. The Butte and Boston claims are sold for \$17,000 to the Cascade Arsenic M. Co., which will expend \$2500 in development work. Arsenic ore—the yellow sulphide—is on this property. The company will exploit it for this metal as well as for copper.

STEVENS COUNTY.

Oscar Szontagh, late manager Le Roi smelter at Northport, talks to the Spokane Spokesman-Review as follows:

"The average cost of smelting the ore is about \$3 90 a ton. During July it was \$3.85 a ton. During August it will run a little higher, because of the short supply of ore and the poor coke with which we have been working. The Le Roi Co. is making big money—making lots of money—but it comes from the savings which I have made at the smelter. The ore is of no higher grade. The reports for June and July show profits of \$207,000. Those were profits made by the economies which I effected at the smelter. I have done away with granulating and roasting the matte, and I have avoided many mechanical losses. The plant is running smoothly, and was smelting about 1000 tons a day, with a force of 400 men, as long as the supply of ore kept up.

"The Rossland ore is the hardest to treat that I have ever found anywhere in the world. There is an excess of silica which is particularly difficult to handle. A story was sent out of Rossland that \$40 ore was being sent out from the old dumps. We had one carload of ore from the dump that went \$40. That was all.

"There has been much foolishness written about copper losses at Northport. The records show that the first superintendent, who is a fine metallurgist, had slag losses of from .3% to 1%. Then another took the place, and stories were given out that his slag only showed traces in copper. Such claims were nonsense. As a matter of fact, he was losing from .6 to .8 of 1% copper in his slag, as assays of it now show. I have cut down the slag losses to .36 of 1%.

"The Le Roi ore carries on an average about 1/2 ounce gold, 1.5% copper, and a little less than an ounce in silver. After the losses in smelting are deducted, that means about 23 pounds of copper to the ton. We were paid an average of 7.3 cents a pound for our copper in July. That means about \$1.60 a ton for the copper alone, in the ore. Half an ounce of gold is \$10. With those as average figures, one can easily see that the Le Roi should be making money."

FOREIGN.

BRITISH COLUMBIA.

Kaslo reports a rich find of copper on the Copper Star group, Salisbury creek, near Fry creek, on Kootenay lake. Assayer Neltzel says it runs 75% in copper.

Rossland reports the aggregate tonnage for the week 7463 tons—Le Roi, 4470; Le Roi No. 2, 588; Centre Star, 1470; War Eagle, 720; Giant, 155; Velvet, 60. Total for the year to date, 210,734 tons.

Increases are to be made at once in the crews of the Nickel Plate and the Kootenay mines, now working 75 men.

Grand Forks hears a report from St. Paul, Minn., that men there have an understanding with the Great Northern railway to erect a 1000-ton custom smelting plant near Grand Forks.

THE KLONDIKE.

Dawson reports producing quantities shown by All Gold creek, which was abandoned over three years ago because its pay streak was both uncertain and shallow. This summer has been found a pay streak from 120 to 200 feet wide, 2 feet deep. All Gold creek is 50 miles from Dawson, further distant than any other streams in that direction that have paid well.

G. H. Hees was recently sent to Dawson by the Canadian Manufacturers' Association to make a thorough examination into the business prospects of the Yukon Territory. He has issued his official report, and it is decidedly pessimistic. The total yield of gold last year in the Klondike was \$24,000,000. The production of the coming year, according to the Government estimates, will not exceed \$14,000,000—a falling off of nearly one-half. No new discoveries have been made for over a year, although since 1897 thousands of prospectors have been exploring every creek and mountain in the country. At Dawson, Mr. Hees reports ten applicants for every job, yet boatload after boatload of men continue to arrive, the transportation companies keeping up the illusion abroad that Dawson is the needy man's paradise.

The Mining Congress.

The fifth annual session of the International Mining Congress met at Butte, Montana, on the 1st inst. In deference to the Labor Day celebration the Congress took an adjournment from 10 o'clock, the time announced for the morning session, until 2 o'clock P. M.

When the Congress assembled at that hour there were 200 delegates present, more arriving on all trains. Governor J. K. Toole made an address of welcome on behalf of the State, Mayor Davey on behalf of the city of Butte, and former Governor J. E. Rickards on behalf of the Business Men's Association of Butte. E. L. Shaffner, president of the Mining Congress, spoke as follows:

I believe that by the wise deliberations and enactments of this honorable body; by the scientific discussions to be held here, and by the practical object lessons taught by this great display of the mineral resources and opportunities of your wonderful State, an influence will be created which will never cease to operate to the interest of Montana. We accept your hospitality so generously offered and assure you that the feelings which prompt it are both appreciated and reciprocated.

Perhaps, in view of the many new members before me, I may be allowed a word to the Congress in emphasis of one or two points expressed in the president's annual call.

First as to the origin and aim of this body. The International Mining Congress was forced into being through a recognition of certain necessities and abuses existing in our mining laws and practices. These necessities, which are apparent to all interested in mining, are tolerated by our national Government, we believe, through its ignorance of and lack of proper means for investigating mining interests. The conviction also prevails that the great mining population of our own and other countries, laboring under the disadvantage of remoteness from the great business and political centers, might, through the united efforts of representatives of the various sections interested, advance the interests which all miners hold in common. These announcements early crystallized into a demand for a separate department in our national Government, which should be devoted to scientific research and experiment and to the collection of information valuable to the mining industry, and whose head should be made a member of the President's Cabinet. The assertion that such a department is not needed, and would prove a useless expense to the country, does not need to be disproved to any who have watched the immense growth of the mining industry during the past five years. The parallel case of the creation of the Department of Agriculture has already been cited before this Congress.

During the past winter a bill for the creation of a department of commerce and labor was introduced into the House, having a bureau of mines and mining included in its specifications. Believing this great industry deserved a larger recognition and demanded more attention than could be obtained through a mere bureau, our committee earnestly protested against such a bureau and succeeded in having it eliminated from the pending bill. And through Representative Wood of California a counter bill was introduced, providing for the creation of a department of mines and mining. So well was this bill supported that it was at length agreed that a committee composed of representatives from the different departments and general government be appointed to investigate the whole matter and consider what bureaus could be dropped from the proposed department of commerce and labor without loss to the industries represented.

Increased interest was shown by the delegates to the Mining Congress, on the 2nd inst. and the attendance was more than double when the session was called to order.

Committees on credentials and permanent organization were appointed. There were five addresses given on the 2nd by W. H. Frazer, Waldemar Lindgren U. S. Geological Survey; C. M. Reeves, of the mining department of the Louisiana Purchase Exposition; E. Dale Owen and Mrs. E. Haskell.

Mr. Lindgren, after tracing the formation of the gold-bearing veins, submitted figures showing the output of gold in North America, from the time of the discovery up to 1900 the United States producing \$2,360,000,000 of gold; Mexico \$181,000,000, and British America \$142,000,000. He said: The most important gold belt in North America is that stretching along the Pa-

cific Coast. Throughout this stretch of country the gold veins are accompanied by great development of the placers and by far most of the gold has been obtained from the placers. California has yielded from this belt \$1,300,000,000; Oregon \$55,000,000; British Columbia and Northwest Territory, \$120,000,000, and Alaska, \$31,000,000. During 1900 the belt yielded \$55,000,000. If no further discoveries are made in this region, it is the belief that these figures will rapidly decrease. California's output will doubtless be maintained at the present figure for many years to come. It is believed that increased quartz mining will in some measure compensate for the loss in the gold production.

W. H. Frazer said:

"The man who locates a mining claim and goes to work upon the same for the purpose of developing should have a fair knowledge of mineral beds or hodies and the indications which point to him the place where such ore bodies may be found. "The days of luck in mining operations are past and the man who to-day makes success of mining venture or investment must know the laws of mineral nature and have a keen intelligence of mining operations, else he goes the way of failure and becomes a deterring instrument to all advancement in the community and State in which he lives.

"It is intelligent mining that has made the mining States of the West the bulwark of the national treasury. It is intelligent mining that has placed \$1,250,000,000 worth of gold into the hands of the people of the United States, more gold by \$500,000,000 than is owned by any other nation on earth, and this bulwark will last for ages hence, for there are yet billions of the yellow metal stored away in the silent treasure houses of the Rocky Mountains and it is being watched and guarded by an intelligent and patriotic people who believe in the advancement, in the development and stability of their country."

On the 3rd inst. the convention resumed deliberations. A. A. Bell, of Montana, introduced a resolution providing for general organization of the men interested in mining to be known as the International Mining Association, the present congress to be merged into the same. Referred to committee.

The committee on resolutions recommended that the resolution introduced by S. L. Dignowity of Utah indorsing the Kearns bill providing for the amendment of sections 2322 of the revised statutes; to do away with extralateral rights, to indorse only the first part of the bill providing for the abolishment of extralateral rights now in force.

Dignowity asked that his resolution receive immediate attention. Delegate Martin of South Dakota explained that the idea of the bill was to change the law of the apex so that a locator would own the surface of the claim and all within the end and side lines extended downward. He contended that the subject of extralateral rights had been fruitful of litigation.

Delegate Joseph of Utah was opposed to the resolution. He said it gave the prospector fifty-two and a half acres and it did not limit his possession in a mining camp and would shut out a great deal of prospecting. The evident purpose of the bill, he declared, was to throttle prospecting and give everything to the capitalist.

Dignowity, author of the resolution, said that he could not see where the proposed law could injure the miner or locator. They could take up 1500 feet square and locate as many claims as they liked. He said the abuses benefited the lawyers and not the miners. The present law originated with the millionaires, and he referred to the owners of the Comstock, whom, he said, located the apex and drove anyone else out.

The question of the apex has been the bone of contention in the endless litigation in which the big mines of Butte have been involved and is one of the principal subjects for consideration by the mining congress.

Five papers were given to the congress on the 3rd. Walter H. Weed of U. S. Geological Survey spoke of the "Geology of Butte," J. A. Holmes of the mine department of the St. Louis exposition delivered an address on the value of exhibitions in promoting the mining industry. J. E. Spurr, U. S. Geological Survey, spoke on "The Application of Geology to Mining," Mrs. F. L. Holland of Galena, Ill., on "Our Present Need—A Department of Mining," C. P. Repath of the Washoe smelter at Anaconda illustrated his lecture. His subject was "Mechanical Engineering—A Factor in the Development of Modern Copper Smelting."

On the 4th an effort to indorse the Kearns bill, providing for a change in the mining laws of the country so as to establish surface claims and do away with extralateral rights was defeated by a vote of 95 to 3, the States voting in the affirma-

tive being California and Missouri. A resolution to the effect that the Congress go on record against the Kearns bill, and to send a recommendation to Congress that the bill be not passed, was carried.

L. B. Prince of New Mexico, who is not in attendance at the session, sent in the following resolutions:

"Resolved, That the magnitude and importance of the mining industry, which has reached over a billion of dollars of annual product, calls for the establishment of a national department of mining, the chief officer of which should be a member of the President's Cabinet;

"Resolved, That the Congress of the United States be respectfully requested to provide by law for the location and working of mines of the reserved minerals, gold, silver and quicksilver, and Spanish and Mexican land grants."

These resolutions were passed.

Personal.

M. L. REQUA is visiting Eureka, Nev.

F. M. SMITH is assistant manager East Helena, Mont., smelter.

W. Z. KINNEY has returned from Reno, Nev., to Silverton, Colo.

A. A. STEEL is now assistant superintendent Pyramid, Nev., M. Co.

N. T. TREGAR is visiting Baker county, Or., mining properties.

GEO. P. HYDE is superintendent smelter Con. M. & S. Co., Cerrillos, N. M.

R. C. McCAFREY is manager Santa Fe G. & C. Co. San Pedro, N. M.

J. W. HAAS has returned from San Francisco to Mineral Park, Arizona.

E. L. HOLLINGSHEAD has charge of the Rankin Milling Co. at Pollock, Idaho.

W. A. CLARK has returned from Jerome, Ariz., to Butte, Mont., via Salt Lake City.

J. W. CHANDLER of Midas, Utah, is inspecting mining property at Colfax, Cal.

B. DOWLING of Virginia, Nev., has been appointed cupeller of the mint at Carson, Nev.

JAS. H. KNOWLES is superintendent Maravilla Copper Co., Solomonville, Arizona.

H. MOORE, Supt. Mazeppa mine, has returned to Stent, Cal., from San Francisco.

J. B. OVERTON, founder of Overton, Nev., has returned there from San Francisco.

P. BOUERY, superintendent La Grange mine, Junction City, Cal., is in San Francisco.

CHARLES CRISMON is superintendent Utah Co.'s property, Fish Springs, Utah.

R. D. WILLIAMS succeeds Superintendent Underwood at Carisa M. Co., Tintic, Utah.

WALLACE MACGREGOR left Massachusetts yesterday for Costa Rica on mining business.

N. B. KNOX, of San Francisco, is examining mining property at Kendall, Montana.

H. ELDBREDGE, metallurgist Grand Central of Tintic, Utah, has returned there from Idaho.

A. E. BRUCE has resigned his position as chief clerk Shannon Copper Co., Clifton, Ariz.

A. E. CHODZKO has moved his office from 12 Front St. to 519 Mission St., San Francisco, Cal.

C. S. KEYES, president New Mexico School of Mines, Socorro, has returned there from Santa Fe.

H. M. ATKINSON succeeds P. O. Perley in the management of the New England Co., Bingham, Utah.

J. A. TEAGARDEN of Boulder, Colo., is visiting Reno, Nev., with a view to investing in mining property.

W. H. ADAMS, of New York City, is in San Francisco from an Alaskan examination of copper property.

B. J. TREWEEK, Lead, S. D., is at Bluefields, Nicaragua, erecting a stamp mill for an English company.

J. L. WAGGONER, superintendent Bonnie Bee mine, has returned from San Francisco to Colfax, Cal.

A. HORN, mine manager the Kwandang-Soemalata M. Co., has arrived at Soemalata, North Celebes.

T. B. WHITTED, for five years connected with the General Electric Co., of Denver, Colo., resigned September 1.

JOHN REUTER is manager of the Goram M. & M. Co., working the Smuggler-Almont group, Dunton, Colo.

T. GARNIER, superintendent of the Osceola mine, Alleghany, has returned there from Los Angeles, Cal.

W. A. HEWITT of the Compressed Air

Machinery Co. has returned to San Francisco from southern California.

E. H. BENJAMIN, secretary California State Miners' Association, has returned from Oroville to San Francisco.

J. B. RANDOL, former manager New Almaden, Cal., quicksilver mine, has returned to the East from San Francisco.

BERNARD MACDONALD has returned to Rossland, B. C., from an inspection of mining property at Berner's Bay, Alaska.

F. W. HOAR, superintendent Old Dominion C. M. & S. Co., has returned to Globe from Clifton and Morenci, Arizona.

W. F. ZIMMERMAN, vice-president and general manager St. Lawrence Power Co., has resigned, to take effect September 1.

RICHARD THOMAS, foreman Malakoff hydraulic mine at North Bloomfield, Cal., has resigned. He is succeeded by M. Doyle.

COL. J. A. OWNBEY will manage the development of the mining properties of ex-Sec. of the Treasury Gage in Boulder county, Colo.

GEO. S. SCOTT, Eastern manager MINING AND SCIENTIFIC PRESS, has returned to New York City from a week's sojourn in San Francisco.

GEO. MOORE, of the Sunshine, Mercur, Utah, has gone East to arrange for another set of filter presses to handle increased volume of silmes.

J. B. BALCOMB of Heald's School of Mines, has returned to San Francisco from examination of some mining property in Johnsville, Plumas county, Cal.

H. W. FELTON, W. H. Young, J. D. Sword and J. Rearden have gone to Mazatlan, Mex., to examine a gold-bearing property that the former controls.

N. J. MARTIN, who recently resigned the superintendency of the mines of the New York & Honduras Rosario M. Co. at San Juanito, is at his home at Lewiston, Idaho.

L. T. WRIGHT, general manager Mountain Copper Co., Keswick, Cal., has gone to England for two months. W. L. Cole is acting as manager during Mr. Wright's absence.

THOS. KAVANAUGH now has charge Troy-Manhattan C. Co.'s property at Troy, Arizona. Manager C. H. Cutting has transferred his headquarters to New York City.

O. SZONTAGH has resigned the management of the Le Roi smelter at Northport, Wash. A. W. Watson, late foreman of the plant, succeeds to the post of metallurgist.

P. WISEMAN, general manager Shannon Co., Clifton, Arizona, has resigned his position. The business of the company is temporarily looked after by Thompson and Anderson.

C. O. BAKER, JR., of Baker & Co., platinum refiners of Newark, N. J., has been appointed a director of the National Bank of that city, one of the strongest financial institutions in New Jersey.

A. LOVELL, superintendent motive power Northern Pacific Ry., has resigned and accepted a position with the Santa Fe Ry. as assistant superintendent motive power, headquarters at Topeka, Kan.

A. HOULE, for the past year smelter superintendent for the Old Dominion Co., Globe, Arizona, has resigned to accept a similar position with the North American C. Co., Grand Encampment, Wyoming.

A. K. STUART, who had charge of the mineral section of Canada's exhibits at Paris, Glasgow and London, during the last two years, will have charge of the Canadian mineral exhibit at the St. Louis Exposition.

W. N. RYER, formerly associated with the Crescent Steel Co. as traveling salesman, has a similar position with the Midvale Steel Co. of Philadelphia, represented at 220 Market St., San Francisco, Cal.

W. C. RALSTON is nominated as joint Senator from the Tenth California Senatorial District. State Legislatures need just such miners as Mr. Ralston, men with ability to faithfully and intelligently represent the mining industry.

W. I. RAND, associated with the Massachusetts School of Technology, is in Arizona to get a mining property worthy of extensive promotion, and is said to have found what he wants near the Jack Rabbit mine, 25 miles south of Casa Grande.

GEO. HAWKINS and R. B. Shaw of the topographic branch of the U. S. Geological Survey, are in the Copper City and Delamar country, Shasta county, Cal., gathering data and statistics for a special sheet and article on the topography of that section.

H. L. KOPP, of Sonora, Cal., is in Chemulpo, Korea, to erect an 80-stamp mill for a mining company. With his brother, Fred, he sailed from San Francisco May

1st, and 41 days were required in making the voyage, stops being made at Honolulu, Yokohama, Tokio and Kobe.

J. F. PARKS has resigned the superintendency of the South Eureka mine, Amador county, Cal., which position he has held ever since the company started. His duties at the Kennedy mine require his undivided attention. The resignation took effect Sept. 1. John Truscott succeeds him.

Commercial Paragraphs.

JONES & JACOBS, Salt Lake City agents for the Trenton Iron Works, have an order from the Centennial-Eureka mine at Eureka, Utah, to double the capacity of their tramway at the mine.

THE machinery for the 120-stamp mill for the Horse Shoe M. Co. of Deadwood, S. D., has been awarded to the Allis-Chalmers Co., Chicago, Ill. This mill is expected to handle 1000 tons of ore per day.

THE Yaqui C. Co. has ordered from Roy & Titcomb, Nogales, Arizona, two boilers, a pump, an engine and a machine drill. Roy & Titcomb have the contract for the structural steel in the new penitentiary at Hermosillo, Sonora, Mexico.

THE Jessop Steel Co. of England is building a large steel plant at Washington, Pa., in which electrical power distribution will be employed. The company has recently purchased a considerable amount of direct-current apparatus from the Westinghouse Electric & Mfg. Co.

THE official report of Russia's foreign trade for the first four months of 1902 shows the American importations to be virtually the same as in 1901, apparently indicating that Russian buyers have become fully convinced it is better to buy American machinery, in spite of the discriminating duty against it. The comparative figures for 1900, 1901 and 1902 are respectively \$3,980,000, \$7,158,000 and \$8,913,500. In the meantime German and British imports have fallen, their figures being \$34,061,500, \$32,216,500 and \$30,297,000 and \$15,064,000, \$14,317,000 and \$10,394,000. The whole import has continued falling, so that the share of America is relatively larger than in 1901. The exportations continue to increase.

Catalogues Received.

Bulletin No. 29 of the Northern Electrical Manufacturing Co., Madison, Wis., treats of motors, and its thirty-two pages 7x10 inches are as interesting in that line as anything received at this office for some time. The pictures talk, and the letter press tells just about what additional an inquirer would want to know. If Mr. Goe would only make that brochure No. 29 6x9 inches, it would be rated 98 A.

"Established 1868," is the sole statement on the back cover of the most recent catalogue of the Robert Atchison Perforated Metal Co., a good announcement to be able to make, for thirty-four years of successful operation speaks well for any business concern. Perforated metal is the sole subject, an interesting one to many. The booklet will be sent on request. The company's Chicago address is 305 Dearborn St.

Obituary.

FELIX CHAPPELLET, a well-known pioneer California miner, passed away at his home in Oakland, Cal., on the 27th ult., aged 74. He had mined in California for 50 years, and was most prominent of late years in connection with drift mining, in which he achieved deserved success.

Recently Declared Mining Dividends.

Payable.
Bunker Hill & Sullivan M. & C.
Co., Idaho, \$9000..... Sept. 5.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by hydraulic process from J. A. Modglin, in Black Hawk Mine, near Grass Flat, Sierra County, Cal., draining into tributary of Slate Creek emptying into North Fork of Yuba River; from J. G. Johnson, in McCabe Creek Mine, at Enterprise, Butte County, Cal., to deposit tailings in McCabe Creek draining into South Fork of Feather River; from C. L. Canfield, in Shady Creek Mine, at Shady Creek, Nevada County, Cal., draining into Shady Creek emptying into South Fork of Yuba River; from Reamer Consolidated Mining Co., in Green Spring Mine, near Forest Hill, Placer County, Cal., to deposit tailings in Oro Canyon draining into Middle Fork of American River; and from Reamer Consolidated Mining Co., in Baltimore Mine, near Forest Hill, Placer County, Cal., to deposit tailings in Dardanelles Canyon draining into Middle Fork of American River, gives notice that a meeting will be held at Room 36, Flood Building, San Francisco, Cal., Sept. 22, 1902, at 1:30 P. M.

WANTED TO DISPOSE OF
A Quantity of Brass and Steel
Wire Battery Screen.

Address Box 66, care Mining and Scientific Press.

MINING AND SCIENTIFIC PRESS

Whole No. 2199.— VOLUME LXXXV.
Number 11.

SAN FRANCISCO, CAL., SATURDAY, SEPTEMBER 13, 1902.

THREE DOLLARS PER ANNUM.
Single Copies, Ten Cents.

HEREWITH appear engravings of some of the more prominent structures referred to on pages 143, 144 and 145 by C. H. Repath in his paper on "The Mechanical Engineer a

Factor in Modern Mining, Milling and Smelting." The engravings on this page are from photographs furnished by Mr. Repath and have not been published anywhere before. No. 1 shows the briquetting plant of the Washoe Co.; No. 2 depicts blast furnace building of the same company; No. 3 the Leonard hoist, Butte, Montana, one of the newest developments in Montana mine head gear; No. 4 the concentrator building of the Washoe works, and No. 5 the reverberatory building of the Washoe Co.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Published Every Saturday at 330 Market St., San Francisco, Cal.
TELEPHONE, DAVIS 771.

ANNUAL SUBSCRIPTION:

TABLE OF CONTENTS.

ILLUSTRATIONS.—Some of the Smelting Structures at Butte, Mont., 140. Mining and Metallurgical Patents, 149.

EDITORIAL.—The Mining Congress; Some Practical Papers; Something New in Rock Drilling; Much Prospecting This Season; Applicants for Patents, 141.

MINING SUMMARY.—150-151-152-153-154.

LATEST MARKET REPORTS.—17.

MISCELLANEOUS.—Concentrates, 142. The Mechanical Engineer's Factor in Modern Mining, Milling and Smelting, 143-144. Application of Geology to Mining, 145. First Aid to the Injured in Mining Accidents, 146-147. The Value of Topographic Maps; Comparative Cost of Air Compression; Platinum Anodes, 148. Mining and Metallurgical Patents; Ore Roaster Decision; Oil Fuel for Ocean Steamships, 149. Personal; Commercial Paragraphs; New Patents; Notices of Recent Patents; Books Received; Catalogues Received, 154-17.

The Mining Congress.

The fifth annual session of the Mining Congress held at Butte, Mont., Sept. 1-5, had its chief value in the opportunity it afforded the visitors to see the most important mining town in the country, and in its being the occasion for the preparation of four papers, presented in full in this issue. It rejected a resolution endorsing the Kearns bill, doing away with apex and extralateral rights, and endorsed a recommendation to Congress for the creation of a Cabinet Department of Mines and Mining. It decided to call itself in future the "American Mining Congress," to hold its next annual convention in Deadwood and Lead, South Dakota, and elected the following officers: President, J. H. Richards, Idaho; first vice-president, S. W. Russell, South Dakota; second vice-president, E. R. Buckley, Missouri; third vice-president, T. E. Ewing, California; secretary, I. Mahon, Pennsylvania; treasurer, C. W. Goodall, Montana; executive committee—J. T. Armstrong, Washington; G. T. Grayson, Oregon; W. M. Kendall, Ohio.

While the standard of criticism by which such an assemblage is to be judged must necessarily be an elastic one, it is manifest that the Congress did not rise to its opportunities and was in some respects as much of a failure as its Milwaukee predecessor. The mental horizon of some of its members seemed limited. With courteous gallantry that may be admired, though it cannot be commended, the hundred delegates permitted a lady member with six votes to hold them up in parliamentary entanglements for two days. There seemed to be a lack of business capacity and the breadth that should characterize the deliberations of such a gathering was apparently absent.

The Congress stultified itself in turning down Senator Kearns' proposed mining law without even proffer of amendment, while endorsing the movement for a Cabinet Department of Mines and Mining. The one embraced and necessitated the other. To reject one and endorse the other was like resolving to build a house, but in the same breath declaring that the house must have no foundation. It might have walls, and even a roof was admissible, but a substructure was inadmissible.

The local newspapers published in the greatest of all western mining towns where the Congress was held are edited by miners, read by miners, and correctly represent how real miners look at some of the antics of the Congress, a sort of gently amused air pervading their kindly criticism.

However, when one considers the possibilities of such a body, one must only admire its moderation. The Congress needs more miners, some practical men with practical ideas, and less lady parliamentarians and essayists. A pink tea is a lovely function, but a miners' congress can not well be grafted thereon, though to use the word graft in any connected capacity would only tend to create considerable hilarity on the back seats.

The State of Montana and the city of Butte made splendid reception, but the fact is painfully manifest that the Congress in its actions was not wholly rep-

resentative of the real miners; the men who do things and do them right.

If the "American Mining Congress" can take lesson from the mistakes of its predecessor it may do some good, but so far it has not shown much right to pose as the representative of the interests of the American miner.

This paper would not be understood to speak disparagingly of the Congress, nor of the delegates; it has always been friendly to the spirit and stated purpose of the organization, and would be pleased to commend while it hesitates to condemn. "Kindly are the wounds of a friend," and in all kindness the belief is expressed that a congress to rightly represent miners should be more largely composed of mining men.

This paper believes that an "American Mining Congress" could do good. In this belief suggestion is made that the best measure of good could be secured by making it thoroughly representative, not by allowing the belief to go out that a nondescript gathering not really representing the miners can take conclusive action on such a serious subject as the revision of the U. S. mining statutes, but by having made up of real representatives of the mining industry. It would be well for each mining State to have a mining association, each State mining association to elect delegates to the mining congress; these delegates, and those only, to constitute the mining congress. Then it would be an American Mining Congress in fact as well as in name. The movement may work out this way. The idea is commended to general attention.

Some Practical Papers.

In this issue appears in complete form four of the papers read at the Sept. 1-5 meeting of the Miners' Congress at Butte, Montana. They are given publicly because they are believed to be practical and of interest to the miner and metallurgist. This is not meant to be in any way condemnatory of the many fine essays and articles, speeches and addresses at that gathering, but which though admirable in style and composition do not give much information. In this regard the MINING AND SCIENTIFIC PRESS suffers from an embarrassment of riches, as the mass of material furnished from that meeting for publication transcends our powers of immediate reproduction.

Mr. Repath's paper will be considered by many as the most noticeable of all elicited by the occasion. The title of the paper by no means indicates its contents, which embrace a historical resume of Montana smelting operations. To many the chief charm of Mr. Repath's paper is the standpoint from which it is viewed—that of the mechanical engineer. This is believed to be new. Like metallurgists, however, he is optimistic and progressive. That sentence is particularly worthy of note where he says: "The time is not far distant when all the boiler power required to run a whole smelting plant will be generated by the waste gases from the furnaces, utilizing the heat from the sulphur as well as the gases used from the coal used in smelting the ore." The general trend of metallurgical progress is in line with the bold prophecy. The article will be read with interest by all interested in any way with smelting the world over.

The address was illustrated by about 100 stereopticon views, especially prepared for the occasion. On the front page appear five half-tone engravings of some of the surface plants of the Washoe and Boston and Montana companies at Anaconda and Butte, Montana, not heretofore published, from photographs furnished by Mr. Repath in connection with the article.

Another paper, read by Dr. G. W. King, of Helena, Mont., is also published in full, which, while not telling anything new or notable, is of sufficient value to mining men to warrant such publicity. The wording of the article by Dr. King might be condensed a little without injury to the topic, but the ideas and practical suggestions make the article of real value to every mining man in any capacity, whether on the surface or underground. We believe the article could be read with profit by every one connected in any active way with the work of mining, and publish it verbatim, knowing that in no way could greater publicity be given to it among mining men than by its appearance in this journal.

It is believed that in every mine of any consequence it would be good business—purely as a business proposition—to organize a small corps of trained men whose business in case of accident or personal injury would be to take care of the injured and afford relief till the doctor or surgeon arrived. Every miner will recall from his personal experience an instance where prompt aid would have saved considerable suffering and even life itself. Men who have kept records of mine accidents tell us that the majority of the underground accidents that befall miners happen to them when moving about from one part of the mine to another. The miner actually at work seems less liable to injury than when he is going around the mine. The idea of having a sort of hospital corps on a scale commensurate with the size of the mine and number of men employed might well commend itself to the favorable attention of those most directly interested in keeping down loss of life or limb as much as possible.

The application of geology to mining is a topic that was well handled by J. E. Spurr of the U. S. Geological Survey.

Ever since 1775, when Werner was appointed professor of mining at Freiberg, there has been a great amount of practical value furnished the miner by the geologist, down through the days of Dana, Lyell, Wilkinson, to Le Conte and Van Hise, not alone in indicating where valuable mineral deposits may be found, but in the almost equally valuable work of showing where it were useless to look for certain minerals.

In this "application of geology to mining" it is to be borne in mind that there is or should be an application of mining to geology. Some geologists, and possibly, some miners, overlook the fact that mining is the parent of geology; that mining can help geology, probably more than geology can help mining. Mining can help geology by furnishing material upon which the geologist can found the principles of his science; it can also help by placing at the disposal of the geologist the observations directly gained by those actively employed in mining. Mine managers and others can help the geologist just as much as he can help them. Geology can sort and systematize the data as received and think out important truths, that might not occur to the miner, thus both giving mutual aid of common value each to the other, both miner and geologist working together for the common good and, incidentally, advancing science.

Mr. Chapman's paper on the use of topographical maps is timely and to the point. Like the others published it is practical, and hence finds place.

SOMETHING new in rock drilling for deep holes is reported from Frankfort, Germany, where Howarth and Walski have a device for utilizing the flushing water instead of the boring rod to convey motive power to the horer, the boring being done by a hydraulic motor attached to the bottom of the rods, water under pressure being forced through the hollow rod to the motor, the escaping water doing the flushing. The engineers mentioned say that with a drive pipe and piston 2 inches in diameter and a working pressure of 170 pounds, the test motor gave twelve strokes per second, consuming 1.1 gallons of water, and that the 8-inch bit drilled through hard sandstone at the rate of 26 inches per hour; in soft sandstone at the rate of 23 feet per hour.

APPLICANTS for patents must make entry on all mining claims within the year ensuing in which the period of publication terminated. In the past the rule was that entry could be made "within any reasonable time," which permitted some applicants to come in with their entries several years after publication had expired. But now in the event that the entry is not made in the calendar year, the applicant's entry is void. All questions as to the annual expenditure upon mining claims are not for the determination of the Land Department but of the courts.

A GREAT DEAL of prospecting is being done this season, from the homely grubstake proposition to the elaborate outfit of the monied prospector. Local papers are chronicling strikes and discoveries in all parts of this great region where is still the prospector's domain. The horseback prospector is not so much in evidence, slower, surer examination of possible mineral ground taking the place of the men who once hurriedly rode over an area, looking only for gold or silver.

Concentrates.

A CROSSCUT tunnel rarely cuts a vein in pay.

SNOW to the depth of 30 feet is not uncommon in the Sierras and Rocky mountains.

PROSPECTING AND MINING are permitted within U. S. Government forest reserves.

It is ordinarily a good rule never to buy stock in a corporation that pays an unearned dividend.

SALAMMONIAC is made from the ammonia water of gas works by the addition of hydrochloric acid.

REMOVING the bark from mine timbers lengthens the life and increases the efficiency of the timbers.

THE existence of sulphide of gold in nature is a question of some doubt. It has never yet been isolated from any of the ores.

TIN is found in at least two localities in the United States: Temescal, California, and Bear Gulch mining district, South Dakota.

CINNABAR can be produced artificially by the action of a superheated solution of alkaline sulphide on the black amorphous sulphide of mercury.

ARGENTINE is the richest of the silver ores, but it is found mixed up with sulphides of other metals. Mixed with galena it forms what are called silver-lead ores.

THE bromine process of gold extraction was tried at the Nellie Bly mine, Boulder, Colo., a detailed description of which appeared on pages 205 and 206 of the issue of Feb. 19, 1898.

In general concentration of cinnabar ore is not deemed advisable; certainly, in many cases it would be unavailable, as it would cost more than direct treatment of ore as it comes from the mine.

ONE can only take up one timber claim under the law of 1878, or use the pre-emption or homestead right once, but one can locate as many mining claims as he can hold by annual assessment work.

TO make canvas waterproof dissolve one part of pure beeswax in two parts gasoline, paint the canvas quickly therewith. The gasoline will evaporate and leave the wax in the fibers of the canvas. This must all be done in the open air and away from a flame or light or fire of any kind.

ONE easy way to make blue-print paper is to take one gramme of citrate of iron and ammonia, and dissolve in five grammes of water. Then make another separate solution of one gramme of ferricyanide of potash in five grammes of water. Mix the two in the dark, and apply to the paper.

"YELLOW BRASS" is composed of copper sixteen parts, zinc eight parts and one-half part of lead. A light colored brass may be made of copper six parts, tin one part and one-quarter part of zinc. Red brass is composed of copper twenty parts and one part each of tin, zinc and lead.

THIS paper is always pleased to receive and publish communications of interest in mining and metallurgy. Such interchange of opinion, knowledge and experience is of common value, and mining men everywhere are invited to consider our columns an open forum for discussion and information.

THE prevailing belief among some geologists is that all placer gold has been derived from mineralized veins and other rocks forced up from the subterranean depths by volcanic action, the fine gold being gradually washed down and deposited in the lower placers. No description of any Alaskan deposits suggests a different origin.

IRON PYRITES are the bearers of gold and silver. The extensive gold deposits of the Southern States constitute a belt or accumulation of veins of iron pyrites. The gold has its seat originally in the pyrites, which, when decomposed, liberates the gold and it appears in a metallic state. The pyrites are the matrix of the gold.

THE American standard boiler horse power is: Thirty pounds of water evaporated per hour at a boiler pressure of seventy pounds, temperature of feed water 100° Fahrenheit. For example, a boiler evaporates 300 pounds of water per hour, boiler pressure seventy pounds, feed water 100° F., then the boiler's H. P. would be 10.

NATIVE SILVER nuggets are frequently found in Western mines. At Austin, Nev., such were found many years ago; also at the Silver King mine, Globe district, Arizona, and at the Mollie Gibson mine, Colorado. In Mexico the native silver found in the Batopilas mine shows as beautiful examples of its kind as ever found in any part of the world.

THE real business of the wooden aqueduct called a flume is to carry water. A sluice, however, is designed for gravel in suspension in water, and has a false bottom of riffles for the twofold purpose of preserving the real bottom from destruction by the gravel and of catching in the interstices between the riffles any gold that settles as the water and gravel pass on.

SPODUMENE is found in several places in the Black Hills, the richest mine being at the Etta tin mine near Keystone, South Dakota. Spodumene is a whitish crystal which resembles logs of petrified wood, having a similar grain. It is found in pockets and is mined by open cuts. Frequently a pocket will be struck containing several tons. It is mined for its lithia values, the material containing about 5% to 6% lithia, and considerable

silica and alumina. It is sent from New York to a refinery in New Jersey, where the lithia is saved. The ore is worth about \$40 per ton at the Atlantic seaboard.

FOR a grade to a tunnel or drift, 5 inches to 100 feet will work satisfactorily. Where cars are run by hand, the loaded car will run itself down this grade without having to be continually braked, and the unloaded car can be pushed up grade at a fast walking speed. Where animals are used and handled in trains, 3 inches to 100 feet can be operated satisfactorily.

WHERE a surface condenser is used the condensed steam may be returned to the boilers and the process of evaporation repeated indefinitely, thus securing pure water, provided the cylinder oil can be taken out of it. This would effectually dispose of the scale problem, but that advantage is often offset by the pitting of tubes and shell that results from the use of pure water.

TO MEASURE the difference of height between two places with a barometer, first measure the air pressure, P , at the lower station, and then the air pressure, p , at the upper station. Calling T the measured temperature Fahrenheit, the vertical distance in feet between the two sections = $(60,360 + [T - 32] 122.68) \log \frac{P}{p}$.

If one has a pattern made of soft pine put together with nails, an iron casting made from it will weigh sixteen pounds to every pound of the pattern. If the casting is of brass it will be eighteen pounds to every pound of the pattern. A metal that will expand in cooling is made up of nine parts lead, two parts antimony and one part bismuth. This alloy is of practical value in filling holes in castings.

ASSUREDLY, putting up buildings and machinery for work on a claim will count for assessment work if accompanied by such other work as would necessarily go with the erection of the plant, and if done in the required time. A dam and ditch built on a claim by another outside party, to convey water onto his ground, can not be counted by the owner of the location on which the dam and ditch are constructed as assessment work in securing a patent.

TO AMANGAMATE a new copper plate, many miners first rub it with extremely fine brick dust, or very finely sifted wood ashes, then rubbing it briskly with a woolen rag dipped in dilute nitric acid—one part acid, nine parts water—until thoroughly polished, then repeatedly washed in clear water. A solution of cyanide of potassium may then be applied, after which prepared quicksilver is put on until the entire surface of the plate is thoroughly coated and is bright, soft and sensitive to the touch.

A 16 AND 12x18 compressor, if in good condition, should be capable of operating three 2½" drills or two 3½" drills with eighty pounds air pressure. A 6 and 6x6 air compressor is not large enough to run any drill, as the capacity would be only about 25 cubic feet of free air per minute. This calculation is based on the three 2½" drills using 260 cubic feet of free air per minute, or two 3½" drills using 252 cubic feet of free air per minute. To calculate the free air capacity of the compressor, multiply the effective area of the air piston in square feet by the piston speed in feet per minute, which, in this case, is about 270, based on a speed of 120 revolutions per minute.

TO REMOVE accumulation of rust on iron articles, attach a piece of ordinary zinc to the articles and then let them lie in water to which a little sulphuric acid is added. They should be left immersed until the rust has entirely disappeared, the same depending on how deeply they were rusted. If there is much rust, a little sulphuric acid should be added occasionally. The essential part of the process is that the zinc must be in electrical contact with the iron. A good way is to twist an iron wire tightly around the object and connect this with the zinc, for which a remnant of a battery zinc is suitable, as it has a binding post. Besides the simplicity of this process, it has the advantage that the iron itself is not attacked in the least as long as the zinc is in good electrical contact with it. Delicate pieces of mechanism which have become badly rusted can be cleaned by wrapping a galvanized wire around them instead of the zinc, in which case the acid should not be too strong. When the rust is all cut off the articles will appear dark gray or black. They must then be thoroughly washed and oiled. It is well to warm them slightly when dry, so that the oil may the more readily sink into the surface.

AS MUCH and as careful attention should be given to the alkalinity of cyanide solutions in mill work as to the strength in KCN. Unless a sufficient, constant and regular alkalinity is maintained, the most efficient and economical results can not be had from the action of the KCN. A good average standard of protective alkalinity is one-half of 1%, as determined by a decinormal sulphuric acid solution. The best standard will have to be determined by experiment on the particular ore being treated. Some ores require as much as 1% protective alkalinity, while other ores only need to be kept positively alkaline, which alkalinity must be independent of the alkalinity due to the KCN. Zinc is soluble in alkalies and an excessive alkalinity causes an excessive consumption of zinc. This excess of zinc in the solutions is detrimental and one of the conditions which is termed "foul solutions." Lime is one of the best purifiers of water there is. A lime alkalinity in the mill solution will precipitate the organic matter in solution and much of that

which is mechanically floating, and also many of the mineral salts, thereby keeping the solutions chemically clean. About two pounds of lime is all that a ton of water will carry in solution. A greater quantity may be floated, but such excess so floated will deposit, like mud would, on the zinc, and by this coating it mechanically prevents precipitation. Such excess of lime so deposited with the precipitates would much increase their bulk and the labor and difficulty of reducing them to bullion. A good method of determining the alkalinity of the mill solutions, as practiced in the Black Hills, is given in Bulletin No. 5 of the South Dakota School of Mines.
